`CASE` operates similarly to conditional scripting in other programming languages, allowing it to function like an if / then / else statement or as a switch statement.

`CASE` sets one or more `WHEN` conditions to be evaluated. When a condition is evaluated as true, the database applies the specified action in a `THEN` clause. If no matches are found, the database applies the action in the `ELSE` clause. If no `ELSE` clause is specified and no matches are found, the result is `NULL`.

This evaluation creates a new column where the values are expressions inside the `THEN` clause.

### Syntax

SQL

```
--To use CASE like an if / then statement:

CASE <caseCondition> ELSE expression | NULL END

<caseCondition> ::=
WHEN search_condition | expression THEN expression | NULL

--To use CASE like a switch statement:
CASE switch_expression <switchCondition> ELSE expression | NULL END

<switchCondition> ::=
WHEN switch_value THEN expression | NULL
```

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Arguments | Description |
| --- | --- |
| `search_condition` | A condition including a column name and a Boolean expression to evaluate. |
| `switch_expression` | A column name to be used to evaluate a `switch_value`. |
| `switch_value` | A value to be evaluated for the `switch_expression`. |
| `expression` | An expression to return based on evaluating the `search_condition` or `switch_expression`. |

### Example

This example uses conditional logic with `CASE` to categorize individuals into different groups based on their ages.

SQL

```
SELECT age,
  CASE
    WHEN age < 13 THEN 'child'
    WHEN age < 19 THEN 'teen'
    ELSE 'adult'
  END AS age_grp
FROM sys.people
ORDER BY age;
```

### Example

This example uses switch conditions to categorize age groups.

SQL

```sql
SELECT age,
  CASE age
    WHEN 13 THEN 'thirteen'
    WHEN 14 THEN 'fourteen'
    WHEN 15 THEN 'fifteen'
    WHEN 16 THEN 'sixteen'
    WHEN 17 THEN 'seventeen'
    WHEN 18 THEN 'eighteen'
    WHEN 19 THEN 'nineteen'
    ELSE 'not teens'
  END
FROM sys.people;
```

## COALESCE

Returns the first argument that is not NULL or NULL if all arguments are NULL. Arguments must be the same type, and the returned value is the most compatible type.

`COALESCE` can work with mixed-type numeric arguments, which means the lower precedence types are cast to the highest one. For example, when using `TIMESTAMP` and `DATE` data types, all values are cast to a timestamp.

### Syntax

SQL

```sql
COALESCE(value1, value2 [,...])
```

| Argument | Data Type | Description |
|---|---|---|
| `value [,...]` | All data types are supported. All values must be of the same type. | Values for comparison to find the value that is not NULL. |

### Example

```sql
SELECT COALESCE(null,null,13,null,8);
```

Output: `13`

## COMMIT

Returns the most recent commit hash of the database to which the client is currently connected.

### Syntax

```sql
COMMIT()
```

### Example

```sql
SELECT COMMIT();
```

Output: `cd0d53e3aa`

## CURRENT_DATABASE

Alias for **DATABASE**.

## CURRENT_NODE

Returns the name of the SQL Node where the current query executes. The name of the node corresponds to the `name` column in the `sys.nodes` system catalog table.

### Syntax

```sql
CURRENT_NODE()
```

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

### Example

```sql
SELECT CURRENT_NODE();
```

Output: `sql0`

## CURRENT_GROUPS

Returns the fully qualified names of groups to which the current user belongs. You can query the `sys.groups` system catalog table to view the group information.

### Syntax

```sql
CURRENT_GROUPS()
```

### Example

```sql
SELECT CURRENT_GROUPS();
```

Output: `['sso_users@system', 'analysts@system']`

## CURRENT_NODE_ID

Returns the identifier of the SQL Node where the current query executes. The name of the node corresponds to the `id` column in the `sys.nodes` system catalog table.

### Syntax

```sql
CURRENT_NODE_ID()
```

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

### Example

```sql
SELECT CURRENT_NODE_ID();
```

Output: `f690c14a-4e4f-4143-8e5e-20c90b60e15c`

## CURRENT_SCHEMA

Returns the name of the current schema.

### Syntax

```sql
CURRENT_SCHEMA()
```

### Example

```sql
SELECT CURRENT_SCHEMA();
```

Output: `schema@database`

## CURRENT_SESSION_ID

Returns the identifier of the current session as a Universally Unique IDentifier (UUID) that matches the `id` column in the `sys.sessions` system catalog table.

### Syntax

```sql
CURRENT_SESSION_ID()
```

### Example

```sql
SELECT CURRENT_SESSION_ID();
```

Output: `6ffe8383-e894-44c0-91c5-38d5925f51ec`

## CURRENT_SYSTEM

Returns the name of the system. You can set the name using the **ALTER SYSTEM RENAME TO** SQL statement.

> If you never set the system name, the Ocient System initializes the name of the system as a random identifier, the UUID.

### Syntax

```sql
CURRENT_SYSTEM()
```

### Example

```sql
SELECT CURRENT_SYSTEM();
```

Output: `2677b88c-7f07-470c-be3e-e1bafddc1221`

## CURRENT_USER

Returns the user for the current connection.

### Syntax

```sql
CURRENT_USER()
```

### Example

```sql
SELECT CURRENT_USER();
```

Output: `user@database`

## DATABASE

Alias for CURRENT_DATABASE.

Returns the name of the database to which the client is currently connected.

### Syntax

```sql
DATABASE()
```

### Example

```sql
SELECT DATABASE();
```

Output: `test`

## GREATEST

Returns the largest non-NULL value of all the arguments, or NULL if all the arguments are NULL. All values must be comparable to each other.

### Syntax

```sql
GREATEST(value [,...])
```

| Argument | Data Type | Description |
| --- | --- | --- |
| `value [,...]` | All data types are supported.<br><br>All values must either be of the same type or comparable to each other. | A series of values to compare to find the largest value of the set. |

### Example

SQL

```
SELECT GREATEST(12,13,5,8);
```

Output: `13`

## IF_NULL

Returns the first argument that is not NULL or NULL if all arguments are NULL. Arguments must be the same type, and the returned value is the most compatible type.

`IF_NULL` can work with mixed-type numeric arguments, which means the lower precedence types are cast to the highest one. For example, when using `TIMESTAMP` and `DATE` data types, all values are cast to a timestamp.

### Syntax

SQL

```
IF_NULL(value1, value2)
```

| Argument | Data Type | Description |
| --- | --- | --- |
| `value [,...]` | All data types are supported. All values must be of the same type. | Values for comparison to find the value that is not NULL. |

### Example

```sql
SELECT IF_NULL(null, 5)
```

Output: `5`

## LEAST

Returns the smallest non-NULL value of all arguments, or NULL if all arguments are NULL. All values must be comparable to each other.

### Syntax

```sql
LEAST(value [,...])
```

| Argument | Data Type | Description |
|---|---|---|
| `value [,...]` | All data types are supported.<br><br>All values must either be of the same type or comparable to each other. | A series of values to compare to find the smallest value of the set. |

### Example

```sql
SELECT LEAST(12,13,5,8);
```

Output: `5`

## MURMUR3

Returns a 32-bit **MurmurHash3 hash** of the input value as an INTEGER data type. If you specify a NULL input value, the function returns 0. This function is primarily useful for partitioning data.

### Syntax

```sql
MURMUR3(value)
```

| Argument | Data Type | Description |
| --- | --- | --- |
| `value` | All SQL data types are supported. | Specified value for the MurmurHash3 hash function. |

### Example

```sql
SELECT MURMUR3(null);
```

Output: `0`

### Example

```sql
SELECT MURMUR3('fred');
```

Output: `331477181`

## NULL_IF

Returns the NULL value if two arguments are equal; otherwise, returns the first argument.

### Syntax

```sql
NULL_IF(value1, value2)
```

### Example

```sql
SELECT NULL_IF(13,12);
```

Output: `13`

### Example

```sql
SELECT NULL_IF(13,13);
```

Output: `NULL`

## RAND_UUID

Alias for **UUID_GENERATE**.

## SHOW

The `SHOW` function lets you explore the database and its metadata for user-defined items. For details, see **Information Schema**.

### Syntax

```sql
SHOW <item>;

-- <item> can be any of the following:
{   COLUMNS,
    DATA_TYPES,
    DATABASES,
    GROUPS,
    INDEXES,
    RESERVED_WORDS,
    SCHEMATA,
    TABLES,
    USERS,
    VIEWS }
```

© 2026 Ocient, Inc

### Examples

This example uses SHOW to explore databases on the system.

```SQL
SHOW DATABASES;
```

*Output*

```SQL
database_name
created
------------------------------------------------------------------------------
test
2022-12-19 19:52:34.576426348
```

This example explores table data.

```SQL
SHOW TABLES;
```

*Output*

```
SQL
```

```
table_catalog
table_schema
table_name
table_type
is_insertable_into
created_at
-------------------------------------------------------------------------------
test
test_schema
test_table
BASE TABLE
YES
2022-12-20 14:45:13.858144104
```

## UUID_GENERATE

Alias for **RAND_UUID**.

Generates a random UUID value (version 4).

For details about the UUID data type, see **Data Types**.

### Syntax

```
SQL
```

```
UUID_GENERATE()
```

### Example

Generate one UUID value.

```
SQL
```

```
SELECT UUID_GENERATE();
```

Output: `3f6b2b58-4c9a-4a32-9b6a-b2f9b8e2a41e`

# TYPE_STRIP

Returns the SQL type of the specified value.

## Syntax

```SQL
TYPE_STRIP(value)
```

| Argument | Data Type | Description |
|---|---|---|
| `value` | All data types are supported. | Specified value for the determination of the type. You can specify columns, literals, and expressions. |

## Examples

```SQL
SELECT TYPE_STRIP(_R{1,2,3});
```

Output: `MATRIX[1][3]`

```SQL
SELECT TYPE_STRIP(current_user());
```

Output: `CHAR`

```SQL
SELECT TYPE_STRIP(NULL);
```

Output: `NULL`

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

```sql
SELECT TYPE_STRIP(NULL::INT[]);
```

Output: `INT[]`

## VERSION

Returns the version of the database to which the client is currently connected.

### Syntax

```sql
VERSION()
```

### Example

```sql
SELECT VERSION();
```

Output: `22.0.0-20230105.2353`

## ZN

If `x` is NULL, returns 0. Otherwise, returns `x`.

### Syntax

```sql
ZN(x)
```

### Example

```sql
SELECT ZN(null);
```

Output: `0`

### Example

```sql
SELECT ZN(12);
```

Output: `12`

# Data Definition Language (DDL) Statement Reference

Reference for Ocient Data Definition Language (DDL) statements, including CREATE, ALTER, and DROP for databases, tables, views, indexes, and other objects.

DDL statements allow users to run commands and administrative operations on the Ocient® System. You can execute DDL statements over a database connection to manage nodes, storage spaces, tables and views, system configuration, users and groups, underlying storage segments, and more.

> ⚠ **Quoting Identifiers**
>
> In all DDL statements, identifiers not in double quotes must begin with a letter and can only contain letters, numbers, and underscores. Identifiers are the names of databases, tables, nodes, and so on. For details, see **Identifiers**. The Ocient System internally converts identifiers to lower-case. Identifiers in double quotes can contain any characters besides newline and carriage return, can begin with any character, and are not case-adjusted. To use an identifier with the same name as any keyword, it must be in double quotes.
>
> String literals must be enclosed in single quotes. A single quote within a string can be escaped as ”*. *A string literal can be preceded by e to enable additional escape sequences (for example: `e'\n'` ).

DDL statements are supported for these categories:

# Cluster and Node Management

Manage clusters and nodes in an Ocient System, including adding, removing, restarting, monitoring, and replacing storage, foundation, and SQL nodes.

Cluster and Node Management commands allow administrators to manage storage clusters, create and manage storage spaces, create and manage nodes, and apply configuration changes to nodes, clusters, or the overall system.

## CLUSTER

### CREATE CLUSTER

`CREATE CLUSTER` creates a new cluster in the current database. The cluster name must be distinct from the name of any existing tables in the database.

To create a cluster, the logged-in user must be a system-level user.

For details about creating clusters, see **Ocient Application Configuration**.

> ⚠ For Foundation clusters, if the system is configured with a single-cluster configuration, when you add a second Foundation cluster, the system automatically changes to a multi-cluster configuration. This change is irreversible and requires a full system restart to fully take effect.

#### Syntax

SQL

```
CREATE CLUSTER [ IF NOT EXISTS ] cluster_name <create_definition>

<create_definition> ::=
   TYPE [=] foundation
   | PARTICIPANTS [=] (node_name1, node_name2, ...)
   | STORAGESPACE [=] storage_space_name
```

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Parameter | Data Type | Description |
| --- | --- | --- |
| `cluster_name` | string | The name of the new cluster to create. |

### Define Clusters ( `<create_definition>` )

You must include these configuration settings when you create a new cluster.

| Configuration | Data Type | Description |
| --- | --- | --- |
| `TYPE` | string | The supported value is:<br>`foundation` — Processes query operators and handles storage on the system. |
| `PARTICIPANTS` | string | A list of one or more node names included in the new cluster.<br>The number of participant nodes in a cluster must be equal to or greater than the storage-space width. For details, see **CREATE STORAGESPACE**.<br>Adding more than the minimum number of participants to a cluster overprovisions the cluster and allows replacing or dropping participant nodes.<br>Nodes cannot be assigned as participants to multiple clusters. |
| `STORAGESPACE` | string | The name of the storage space for the cluster. |

### Examples

This example creates a Foundation cluster named `lts_cluster0` using the storage space named `my_storage_space` with three participant nodes.

SQL

```
CREATE CLUSTER lts_cluster0
    TYPE=foundation
    PARTICIPANTS=(node1,node2,node3)
    STORAGESPACE=my_storage_space;
```

## DROP CLUSTER

`DROP CLUSTER` removes an existing cluster from the system.

To remove a cluster, you must be a system-level user.

© 2026 Ocient, Inc

### Syntax

```
SQL

DROP CLUSTER [ IF EXISTS ] cluster_name
```

| Parameter | Data Type | Description |
|---|---|---|
| `cluster_name` | string | The name of the specified cluster to remove. |

### Example

This example removes an existing cluster named `lts_cluster0`.

```
SQL

DROP CLUSTER lts_cluster0;
```

## ALTER CLUSTER

### ALTER CLUSTER ADD PARTICIPANTS

`ALTER CLUSTER ADD PARTICIPANTS` adds the specified nodes to an existing cluster in the system. This operation can overprovision the storage space if necessary.

> For the system to recognize newly added nodes, you must restart the cluster. To do this, you can follow the steps in **Add Foundation Nodes**.

### Syntax

```
SQL

ALTER CLUSTER [ IF EXISTS ] cluster_name
    ADD PARTICIPANTS [=] ( node_name1 [,...] );
```

| Parameter | Data Type | Description |
|---|---|---|
| `cluster_name` | string | The name of the specified cluster to alter. |

| Parameter | Data Type | Description |
| --- | --- | --- |
| `node_name1, [,...]` | string | The name of one or more nodes to add to the cluster. |

### Example

This example adds the node `node3` to a cluster named `example_cluster`, which already contains `node1` and `node2`. Following this operation, `example_cluster` consists of three nodes.

SQL

```
ALTER CLUSTER example_cluster ADD PARTICIPANTS (node3);
```

## ALTER CLUSTER DROP PARTICIPANTS

`ALTER CLUSTER DROP PARTICIPANTS` drops nodes from an existing cluster.

This SQL statement fails for a Foundation cluster if dropping the specified nodes brings the number of participants below the total width of the storage space associated with that cluster.

### Syntax

SQL

```
ALTER CLUSTER [ IF EXISTS ] cluster_name
    DROP PARTICIPANTS [=] ( node_name1 [,...] );
```

| Parameter | Data Type | Description |
| --- | --- | --- |
| `cluster_name` | string | The name of the specified cluster to alter. |
| `node_name1, [,...]` | string | The name of one or more nodes to drop from the cluster. |

### Example

This example drops participant node `node3` from a cluster named `example_cluster`, which contains `node1`, `node2`, and `node3`. Following this operation, the participants in `example_cluster` consist of the nodes `node1` and `node2`.

© 2026 Ocient, Inc

```sql
ALTER CLUSTER example_cluster DROP PARTICIPANTS (node3);
```

## ALTER CLUSTER ADD STORAGESPACE

`ALTER CLUSTER ADD STORAGESPACE` links an existing storage space to a storage cluster, enabling tables in that storage space to use the Foundation Nodes of that cluster. A storage space must be associated with at least one storage cluster before you can create tables in the space.

### Required Privileges

To add a storage space to a cluster, you must have system-level privileges.

### Syntax

```sql
ALTER CLUSTER [ IF EXISTS ] cluster_name ADD STORAGESPACE storage_space_name
```

| Parameter | Type | Description |
|---|---|---|
| `cluster_name` | string | The name of the storage cluster to modify. |
| `storage_space_name` | string | The name of an existing storage space to associate with the cluster. |

### Example

This example adds the storage space `analytics_space` to the cluster `lts_cluster_0`.

```sql
ALTER CLUSTER lts_cluster_0 ADD STORAGESPACE analytics_space;
```

## ALTER CLUSTER REMOVE STORAGESPACE

`ALTER CLUSTER REMOVE STORAGESPACE` detaches a storage space from a storage cluster. This detaching prevents the creation of new tables in that storage space within the

cluster.

The statement fails if:

- Tables still exist in the storage space within the cluster. Remove all associated tables before detaching the storage space.
- The storage space is currently set as the system default storage space. Reset the default by using **ALTER SYSTEM SET DEFAULT STORAGESPACE** before detaching the storage space.
- You are attempting to detach the core system storage space: `"systemStorageSpace"`.

### Required Privileges

To detach a storage space from a cluster, you must have system-level privileges.

### Syntax

```
SQL
ALTER CLUSTER [ IF EXISTS ] cluster_name REMOVE STORAGESPACE storage_space_name
```

| Parameter | Type | Description |
|---|---|---|
| `cluster_name` | string | The name of the storage cluster to modify. |
| `storage_space_name` | string | The name of the storage space to detach from the cluster. |

### Example

This example detaches the storage space `analytics_space` from the cluster `lts_cluster_0`.

```
SQL
ALTER CLUSTER lts_cluster_0 REMOVE STORAGESPACE analytics_space;
```

## ALTER CLUSTER ALTER CONFIG SET

`ALTER CLUSTER ALTER CONFIG SET` sets a configuration override for the configuration at the cluster scope. For an explanation of how configuration overrides work, see **Inspect**

**the Current Configuration**.

If the specified path to the configuration setting does not exist, the system considers it as a new configuration and appends it to the collection of existing configurations. To reset a configuration override for a specific key, use the `RESET` keyword.

### Syntax

SQL

```
-- To set a new configuration override:
ALTER CLUSTER [ IF EXISTS ] cluster_name
    ALTER CONFIG SET string_definition [=] string_value [,...]

-- To reset a configuration override:
ALTER CLUSTER [ IF EXISTS ] clusterName
    ALTER CONFIG RESET [ string_definition [,...] ]
```

| Parameter | Data Type | Description |
|---|---|---|
| `cluster_name` | string | The name of the specified cluster to alter. |
| `string_definition` | string | The name of a configuration parameter to alter.<br><br>Contact Ocient® support for details about altering configuration parameters. |
| `string_value` | string | The new value to set for the specified configuration parameter. |

### Examples

This example alters the base configuration for cluster `cluster_name` and sets the certificate for all nodes to a certificate named `cert_name.crt`.

SQL

```
ALTER CLUSTER cluster_name
    ALTER CONFIG SET 'certificateStore.cert' = 'cert_name.crt';
```

This example resets the certificate configuration for cluster `cluster_name`.

```sql
ALTER CLUSTER cluster_name
    ALTER CONFIG RESET 'certificateStore.cert';
```

This example alters the configuration at the cluster scope for cluster `cluster_name` and service role `lts`.

```sql
ALTER CLUSTER cluster_name
    ALTER CONFIG SET 'lts.numLevels' = '3';
```

## ALTER CLUSTER ALTER LOG LEVEL SET

`ALTER CLUSTER cluster_name ALTER LOG LEVEL SET` sets the log level for a particular logger for all nodes in the provided cluster. For an explanation of how configuration overrides work, see **Inspect the Current Configuration**.

### Syntax

```sql
-- To set a new configuration override:
ALTER CLUSTER cluster_name
    ALTER LOG LEVEL SET [ <logger_parameters> [,...] ]

<logger_parameters> ::=
    { 'ALL' | logger_name [=] logging_level }

-- To reset a configuration override:
ALTER CLUSTER cluster_name ALTER LOG LEVEL RESET [logger_name [, ...] ]
```

| Parameter | Data Type | Description |
|---|---|---|
| `cluster_name` | string | The name of the specified cluster to alter. |

### Logger Parameters ( `<logger_parameters>` )

| Configuration | Data Type | Description |
| --- | --- | --- |
| `logger_name` | string | Use `ALL` for the root logging configuration. Otherwise, the `logger_name` parameter can be any string specifying a logger name for all nodes in the provided cluster. |
| `logger_level` | string | The level of severity to be assigned to the `logger_name`. `logger_level` must be one of the following options: `'EDEBUG' \| 'DEBUG' \| 'VERBOSE' \| 'INFO' \| 'WARN' \| 'ERROR'` See the **Log Monitoring** page for more details on log levels. To reset a logger to the default log level ( `INFO` ), use the `RESET` keyword. |

### Examples

This example alters the log level at the cluster scope. This sets the query log level for all nodes in the cluster to `DEBUG`.

SQL

```
ALTER CLUSTER cluster_name
    ALTER LOG LEVEL SET 'query' = 'DEBUG';
```

This example resets the log level for the query logger for the entire cluster.

SQL

```
ALTER CLUSTER cluster_name
    ALTER LOG LEVEL RESET 'query';
```

## ALTER CLUSTER RENAME TO

Rename an existing cluster in the system.

### Syntax

SQL

```
ALTER CLUSTER old_cluster_name RENAME TO new_cluster_name
```

| Parameter | Data Type | Description |
| --- | --- | --- |
| `old_cluster_name` | string | The name of the specified cluster to alter. |
| `new_cluster_name` | string | The new name to assign to the cluster. |

### Example

This example renames an existing cluster named `lts-cluster-0` to `lts-cluster-1`.

SQL

```
ALTER CLUSTER "lts-cluster-0" RENAME TO "lts-cluster-1";
```

# CONNECTIVITY POOL

## CREATE CONNECTIVITY_POOL

`CREATE CONNECTIVITY_POOL` creates a connectivity pool with one or more SQL Node participants. Connectivity pools define the listen endpoints and advertised addresses that clients use to connect, and enable automatic client redirection within the pool. For conceptual details, default behavior, and common deployment scenarios, see **Manage the Network Configuration of an Ocient System**.

All SQL Nodes must be part of at least one connectivity pool. When multiple pools match a client connection, the system selects the pool with the highest `PRIORITY` value. For details about the selection process, see **Pool Selection Behavior**.

The database commits all changes made from these SQL statements after you restart all the SQL Nodes.

For information on all connectivity pools on the system, query the system catalog tables for **Connectivity Pools**. To see the connectivity pool assignment for each node, query the system catalog table for **connectivity pool participants**.

### Syntax

SQL

```
CREATE CONNECTIVITY_POOL [ IF NOT EXISTS ] pool_name <create_definition>

<create_definition> ::=
    SOURCE_ADDRESS [=] source_ip
    [ SOURCE_PORT [=] source_port ]
    PRIORITY [=] priority
    [ SSO INTEGRATION [=] sso_name ]
    [ REQUIRE_SSO [=] require_sso ]
    PARTICIPANTS (
        ( NODE [=] node_name
          LISTEN_ADDRESS [=] listen_ip
          [ LISTEN_PORT [=] { listen_port | NULL } ]
          ADVERTISED_ADDRESS [=] advertised_ip
          [ ADVERTISED_PORT [=] advertised_port ]
          [ OPENAPI_PORT [=] openapi_port ]
          [ OPENAPI_ADVERTISED_ADDRESS [=] openapi_advertised_ip ]
          [ OPENAPI_ADVERTISED_PORT [=] openapi_advertised_port ]
          [ SSL_CERTIFICATE_FILE [=] cert_base_name ]
          [ OPENAPI_SSL_CERTIFICATE_FILE [=] cert_base_name ] )
        [, ...] )
```

| Parameter | Data Type | Description |
|---|---|---|
| `pool_name` | string | The name of the connectivity pool. |
| `source_ip` | string | A source IP address in CIDR notation (for example, `0.0.0.0/0`). The system uses this string to match incoming connections to the correct pool by evaluating the source IP address of the client against the CIDR range. |
| `source_port` | integer | Optional. An additional source port filter. If you specify this value, the system matches only connections arriving on this port to this pool. Most deployments do not use this parameter. |
| `priority` | integer | The priority of the pool. A higher number indicates a higher priority. When a client connection matches multiple pools, the system selects the pool with the highest priority. |
| `sso_name` | string | Optional. The name of an SSO integration to use as the default for this pool. For details, see **SSO INTEGRATION**. |
| `require_sso` | Boolean | Optional. When you set this parameter to `TRUE`, the pool rejects non-SSO authentication attempts. The system |

| Parameter | Data Type | Description |
| --- | --- | --- |
| | | does not allow setting this parameter to `TRUE` if doing so would eliminate the last pool that allows non-SSO authentication. The default value is `FALSE`. |
| `node_name` | string | The name of the SQL Node. |
| `listen_ip` | string | The IP address that this node listens on for the SQL wire protocol. Use `0.0.0.0` to listen on all interfaces. Connectivity pools do not support dynamic IP addresses. |
| `listen_port` | integer | Optional. The port number for the SQL wire protocol. If you set this parameter to `NULL` or you do not specify this parameter, the node does not accept SQL wire protocol connections on this pool, which creates an OpenAPI-only participant. The default value is `4050`. |
| `advertised_ip` | string | The address returned to JDBC and pyocient clients for connection redirection. This value should be the address that clients can reach, which can differ from the `listen_ip` value when Network Address Translation (NAT) is involved. |
| `advertised_port` | integer | Optional. The port the system returns to clients for redirection. If you do not specify this parameter, the system uses the `listen_port` value. |
| `openapi_port` | integer | Optional. The port on which the HTTP Query API and web UI listen. If you do not specify this parameter, the participant does not start an OpenAPI listener. On a production install, the default `system` connectivity pool sets this value to `443 + node port offset` at bootstrap, provided that `rolehostd` can bind to the privileged port (runs as `root` or has `CAP_NET_BIND_SERVICE`). |
| `openapi_advertised_ip` | string | Optional. The address the system uses for OpenAPI SSO callback URLs and other OpenAPI-specific advertisements. If you do not specify this parameter, the system uses the `advertised_ip` value. This parameter is useful when the HTTP Query API is accessible at a different hostname than the SQL wire protocol. |
| `openapi_advertised_port` | integer | Optional. The port the system uses for OpenAPI SSO callback URLs. If you do not specify this parameter, the system uses the `openapi_port` value. |

| Parameter | Data Type | Description |
| --- | --- | --- |
| `cert_base_name` | string | Optional. The base filename (without extension or path) of an SSL certificate. The system looks for `{value}.crt` and `{value}.key` in `/var/opt/ocient`. Use the `SSL_CERTIFICATE_FILE` value for the SQL wire protocol and the `OPENAPI_SSL_CERTIFICATE_FILE` value for the HTTP Query API. If you do not use the `OPENAPI_SSL_CERTIFICATE_FILE` value, the system uses the `SSL_CERTIFICATE_FILE` value. |

### Examples

Create the connectivity pool named `test_pool` with source address `1.2.3.4/32` and priority `1` for one SQL Node named `sql0`. The node has the IP address `111.1.1.1` and port number `4050` for listening. Specify the local IP address to return to the client.

SQL

```
CREATE CONNECTIVITY_POOL IF NOT EXISTS test_pool
    SOURCE_ADDRESS '1.2.3.4/32'
    PRIORITY 1
    PARTICIPANTS (
        (NODE sql0
         LISTEN_ADDRESS '111.1.1.1'
         LISTEN_PORT 4050
         ADVERTISED_ADDRESS 'localhost'));
```

Create the connectivity pool named `test_pool` with source address `1.2.3.4/32`, port number `44`, and priority `1` for one SQL Node named `sql0`. The node has the IP address `111.1.1.1` and port number `4050` for listening. Specify the local IP address and port number `4050` to return to the client.

SQL

```
CREATE CONNECTIVITY_POOL IF NOT EXISTS test_pool
    SOURCE_ADDRESS '1.2.3.4/32'
    SOURCE_PORT 44
    PRIORITY 1
    PARTICIPANTS (
        (NODE sql0
         LISTEN_ADDRESS '111.1.1.1'
         LISTEN_PORT 4050
         ADVERTISED_ADDRESS 'localhost'
         ADVERTISED_PORT 4050));
```

Create the connectivity pool named `test_pool` with source address `1.2.3.4/32`, port number `44`, priority `2`, and three participant SQL Nodes: `sql0`, `sql1`, and `sql2`. The nodes have the IP address `111.1.1.1` and port number `4050` for listening. Specify the local IP address and port number `4050` to return to the client.

SQL

```
CREATE CONNECTIVITY_POOL IF NOT EXISTS test_pool
    SOURCE_ADDRESS '1.2.3.4/32'
    SOURCE_PORT 44
    PRIORITY 2
    PARTICIPANTS (
        (NODE sql0
         LISTEN_ADDRESS '111.1.1.1'
         LISTEN_PORT 4050
         ADVERTISED_ADDRESS 'localhost'
         ADVERTISED_PORT 4050),
        (NODE sql1
         LISTEN_ADDRESS '111.1.1.1'
         LISTEN_PORT 4050
         ADVERTISED_ADDRESS 'localhost'
         ADVERTISED_PORT 4050),
        (NODE sql2
         LISTEN_ADDRESS '111.1.1.1'
         LISTEN_PORT 4050
         ADVERTISED_ADDRESS 'localhost'
         ADVERTISED_PORT 4050));
```

© 2026 Ocient, Inc

# DROP CONNECTIVITY_POOL

`DROP CONNECTIVITY_POOL` removes the specified connectivity pool.

> All nodes must belong to a connectivity pool. The execution of this SQL statement does not permit the removal of a pool such that a node becomes an orphan. The system also does not allow dropping the last pool that allows non-SSO authentication.

### Syntax

```
SQL

DROP CONNECTIVITY_POOL [ IF EXISTS ] pool_name
```

| Parameter | Data Type | Description |
|---|---|---|
| `pool_name` | string | The name of the connectivity pool to remove. |

### Example

Remove the connectivity pool named `test_pool`.

```
SQL

DROP CONNECTIVITY_POOL test_pool;
```

# ALTER CONNECTIVITY_POOL

## ALTER CONNECTIVITY_POOL SET

`ALTER CONNECTIVITY_POOL SET` sets the metadata of a connectivity pool that includes the source IP address, source port number, priority, and node participants.

### Syntax

```sql
ALTER CONNECTIVITY_POOL [ IF EXISTS ] pool_name
    SET parameter [=] value
    [, parameter [=] value [, ...]]
```

Settable parameters include `SOURCE_ADDRESS`, `SOURCE_PORT`, `PRIORITY`, `REQUIRE_SSO`, and `PARTICIPANTS`. For parameter definitions, see **CREATE CONNECTIVITY_POOL**.

To directly edit the `LISTEN_ADDRESS`, `LISTEN_PORT`, `ADVERTISED_ADDRESS`, or `ADVERTISED_PORT` parameters, you must either remove the participants and add them back with new values for these parameters using the `ALTER CONNECTIVITY_POOL DROP PARTICIPANTS` and `ALTER CONNECTIVITY_POOL ADD PARTICIPANTS` statements, respectively, or use the `ALTER CONNECTIVITY_POOL SET PARTICIPANTS` statement.

### Examples

This example sets the priority to `2` of the connectivity pool named `test_pool`.

```sql
ALTER CONNECTIVITY_POOL test_pool SET PRIORITY = 2;
```

This example changes the priority and enables SSO enforcement on the pool.

```sql
ALTER CONNECTIVITY_POOL my_pool
    SET PRIORITY = 5,
    REQUIRE_SSO = TRUE;
```

This example sets the participants of the connectivity pool named `test_pool` to the list of participants with SQL Nodes `sql1` and `sql2`. When you execute this statement, the database resets the prior list of node participants to the new list. The nodes have the IP address `111.1.1.1` and port number `4050` for listening. Specify the local IP address and port number `4050` to return to the client.

SQL

```
ALTER CONNECTIVITY_POOL test_pool
    SET PARTICIPANTS(
        (NODE sql1
         LISTEN_ADDRESS '111.1.1.1'
         LISTEN_PORT 4050
         ADVERTISED_ADDRESS 'localhost'
         ADVERTISED_PORT 4050),
         (NODE sql2
         LISTEN_ADDRESS '111.1.1.1'
         LISTEN_PORT 4050
         ADVERTISED_ADDRESS 'localhost'
         ADVERTISED_PORT 4050));
```

View the node identifiers of the participants of the `test_pool` connectivity pool by querying the node identifier `node_id` in the `sys.connectivity_pool_participants` and `sys.connectivity_pools` system catalog tables.

SQL

```
SELECT cpp.node_id
FROM sys.connectivity_pool_participants cpp
INNER JOIN sys.connectivity_pools cp
ON cpp.id = cp.id
WHERE cp.name = 'test_pool';
```

## ALTER CONNECTIVITY_POOL RENAME TO

`ALTER CONNECTIVITY_POOL RENAME TO` SQL statement renames the existing connectivity pool.

### Syntax

SQL

```
ALTER CONNECTIVITY_POOL [ IF EXISTS ] pool_name RENAME TO new_pool_name
```

| Parameter | Data Type | Description |
| --- | --- | --- |
| `pool_name` | string | The name of the existing connectivity pool. |
| `new_pool_name` | string | The new name of the connectivity pool. |

### Examples

Rename the `test_pool` connectivity pool to `new_test_pool`.

SQL

```
ALTER CONNECTIVITY_POOL test_pool RENAME TO new_test_pool;
```

## ALTER CONNECTIVITY_POOL ADD PARTICIPANTS

`ALTER CONNECTIVITY_POOL ADD PARTICIPANTS` adds one or more nodes to the participant list of an existing connectivity pool.

For information on all connectivity pools on the system, query the system catalog tables for **Connectivity Pools**. To see the connectivity pool assignment for each node, query the system catalog table for **connectivity pool participants**.

### Syntax

SQL

```
ALTER CONNECTIVITY_POOL [ IF EXISTS ] pool_name
    ADD PARTICIPANTS (
        ( NODE [=] node_name
          LISTEN_ADDRESS [=] listen_ip
          [ LISTEN_PORT [=] { listen_port | NULL } ]
          ADVERTISED_ADDRESS [=] advertised_ip
          [ ADVERTISED_PORT [=] advertised_port ]
          [ OPENAPI_PORT [=] openapi_port ]
          [ OPENAPI_ADVERTISED_ADDRESS [=] openapi_advertised_ip ]
          [ OPENAPI_ADVERTISED_PORT [=] openapi_advertised_port ]
          [ SSL_CERTIFICATE_FILE [=] cert_base_name ]
          [ OPENAPI_SSL_CERTIFICATE_FILE [=] cert_base_name ] )
        [, ...] )
```

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

For parameter definitions, see **CREATE CONNECTIVITY_POOL**.

### Examples

Add one node `sql5` to the participant list of the connectivity pool `test_pool`. The node has the IP address `111.1.1.1` and port number `4050` for listening. Specify the local IP address and port number `4050` to return to the client.

SQL

```
ALTER CONNECTIVITY_POOL test_pool
    ADD PARTICIPANTS(
        NODE sql5
        LISTEN_ADDRESS '111.1.1.1'
        LISTEN_PORT 4050
        ADVERTISED_ADDRESS 'localhost'
        ADVERTISED_PORT 4050);
```

Add two nodes `sql6` and `sql7` to the participants list of the connectivity pool `test_pool`. The nodes have the IP address `111.1.1.1` and port number `4050` for listening. Specify the local IP address and port number `4050` to return to the client.

SQL

```
ALTER CONNECTIVITY_POOL test_pool
    ADD PARTICIPANTS(
        (NODE sql6
         LISTEN_ADDRESS '111.1.1.1'
         LISTEN_PORT 4050
         ADVERTISED_ADDRESS 'localhost'
         ADVERTISED_PORT 4050),
         (NODE sql7
         LISTEN_ADDRESS '111.1.1.1'
         LISTEN_PORT 4050
         ADVERTISED_ADDRESS 'localhost'
         ADVERTISED_PORT 4050));
```

## ALTER CONNECTIVITY_POOL ALTER PARTICIPANT

`ALTER CONNECTIVITY_POOL ALTER PARTICIPANT` modifies the configurations of one SQL Node assigned to the existing connectivity pool.

This SQL statement can alter only one configuration parameter of a participant node at a time.

For information on all connectivity pools on the system, query the system catalog tables for **Connectivity Pools**. To see the connectivity pool assignment for each node, query the system catalog table for **connectivity pool participants**.

### Syntax

SQL

```
ALTER CONNECTIVITY_POOL [ IF EXISTS ] pool_name
    ALTER PARTICIPANT node_name
    SET <connectivity_pool_definition>

<connectivity_pool_definition> ::=
    { LISTEN_ADDRESS [=] listen_ip
    | LISTEN_PORT [=] { listen_port | NULL }
    | ADVERTISED_ADDRESS [=] advertised_ip
    | ADVERTISED_PORT [=] { advertised_port | NULL }
    | OPENAPI_PORT [=] { openapi_port | NULL }
    | OPENAPI_ADVERTISED_ADDRESS [=] { openapi_advertised_ip | NULL }
    | OPENAPI_ADVERTISED_PORT [=] { openapi_advertised_port | NULL }
    | SSL_CERTIFICATE_FILE [=] { cert_base_name | NULL }
    | OPENAPI_SSL_CERTIFICATE_FILE [=] { cert_base_name | NULL } }
```

For parameter definitions, see **CREATE CONNECTIVITY_POOL**.

### Examples

Modify the SQL Node `sql0` to use the new `listen_port` value `4051`.

SQL

```
ALTER CONNECTIVITY_POOL cp_test
    ALTER PARTICIPANT sql0
    SET listen_port 4051;
```

Set the listen port to `NULL` to make the participant OpenAPI-only.

```sql
ALTER CONNECTIVITY_POOL my_pool
    ALTER PARTICIPANT sql0
    SET LISTEN_PORT = NULL;
```

## ALTER CONNECTIVITY_POOL DROP PARTICIPANTS

`ALTER CONNECTIVITY_POOL DROP PARTICIPANTS` removes one or more nodes from the participant list of an existing connectivity pool. If you remove the last node of a connectivity pool, the Ocient System automatically removes the connectivity pool.

For information on all connectivity pools on the system, query the system catalog tables for **Connectivity Pools**. To see the connectivity pool assignment for each node, query the system catalog table for **connectivity pool participants**.

> All nodes must belong to a connectivity pool. The execution of this SQL statement does not permit the removal of a node such that it becomes an orphan.

### Syntax

```sql
ALTER CONNECTIVITY_POOL [ IF EXISTS ] pool_name
    DROP PARTICIPANTS (node_name, ...)
```

### Examples

Remove one node `sql5` from the connectivity pool `test_pool`.

```sql
ALTER CONNECTIVITY_POOL IF EXISTS test_pool DROP PARTICIPANTS sql5;
```

Remove nodes `sql6` and `sql7` from the connectivity pool `test_pool`.

```sql
ALTER CONNECTIVITY_POOL test_pool DROP PARTICIPANTS (sql6, sql7);
```

© 2026 Ocient, Inc

## ALTER CONNECTIVITY_POOL SET SSO INTEGRATION

`ALTER CONNECTIVITY_POOL SET SSO INTEGRATION` assigns a connectivity pool to use a specific SSO integration.

Connectivity pools look for the specified SSO integration name for each database you are trying to connect to. If the database does not support that SSO integration name, it uses the default SSO.

### Syntax

```
SQL

ALTER CONNECTIVITY_POOL [ IF EXISTS ] pool_name
    SET SSO INTEGRATION sso_name
```

| Parameter | Data Type | Description |
|---|---|---|
| `pool_name` | string | The name of the existing connectivity pool. |
| `sso_name` | string | The new name of the SSO integration. |

### Example

```
SQL

ALTER CONNECTIVITY_POOL cp_test SET SSO INTEGRATION sso_test;
```

## ALTER CONNECTIVITY_POOL REMOVE SSO INTEGRATION

`ALTER CONNECTIVITY_POOL REMOVE SSO INTEGRATION` removes an assigned SSO integration.

### Syntax

```
SQL

ALTER CONNECTIVITY_POOL [ IF EXISTS ] pool_name
    REMOVE SSO INTEGRATION sso_name
```

| Parameter | Data Type | Description |
| --- | --- | --- |
| `pool_name` | string | The name of the existing connectivity pool. |
| `sso_name` | string | The name of the existing SSO integration. |

### Example

This example removes the SSO integration `sso_test` from the connectivity pool `cp_test`.

SQL

```
ALTER CONNECTIVITY_POOL cp_test REMOVE SSO INTEGRATION sso_test;
```

# NODE

## DROP NODE

`DROP NODE` removes an existing node from the system.

A node cannot be removed from the system if it is still part of a cluster or one of the two remaining Administration Nodes.

### Syntax

SQL

```
DROP NODE [ IF EXISTS ] node_name [, ...]
```

| Parameter | Data Type | Description |
| --- | --- | --- |
| `node_name` | string | The name of a node to drop.<br>You can drop multiple nodes by specifying additional node names and separating each with commas. |

### Example

Remove a node named `example_node`.

SQL

```
DROP NODE example_node;
```

Remove multiple nodes.

SQL

```
DROP NODE example_node1, example_node2;
```

# ALTER NODE

## ALTER NODE RENAME TO

`ALTER NODE RENAME` renames an existing node.

To rename a node, you must be a system-level user.

> ⚠ Renaming a node can cause a mismatch between the name of the node and the hostname of the node. Furthermore, you have to update users and scripts to use the new name of the node. Use this statement only to reverse these situations that can arise naturally (for example, you must replace a node with a node that has a different name).
>
> If you have a DNS configuration for the node, you must reconfigure the node address after renaming the node by using the **ALTER NODE SET ADDRESS** SQL statement.

### Syntax

SQL

```
ALTER NODE [ IF EXISTS ] old_node_name RENAME TO new_node_name
```

| Parameter | Data Type | Description |
|---|---|---|
| `old_node_name` | string | The name of a node to rename. |
| `new_node_name` | string | The new name for the specified node. |

### Example

This example renames an existing node named `sql0` to `sql1`.

```
SQL

ALTER NODE sql0 RENAME TO sql1;
```

## ALTER NODE ADD ROLE

`ALTER NODE ADD ROLE` adds a role to a node. Each node can have one or more roles that it performs.

To add a role, you must be a system-level user.

### Syntax

```
SQL

ALTER NODE [ IF EXISTS ] node_name ADD ROLE [ IF NOT EXISTS ] <node_role>

<node_role> ::=
{ sql | streamloader | operatorvm | admin | health }
```

| Parameter | Data Type | Description |
|---|---|---|
| `node_name` | string | The name of a node to alter. |

## Node Roles ( `<node_role>` )

This table explains the supported roles for nodes.

| Role | Description | Notes |
|---|---|---|
| `streamloader` | The `streamloader` role allows the node to continually import a large amount of data into the database. | When adding the `streamloader` role, the node must be restarted in order for the change to take effect. |
| `sql` | The `sql` role accepts a SQL statement, parses the statement, and compiles the statement. | You can remove this role only if there is at least one other SQL Node present.<br>When you add the `sql` role to a node that joins the default `system` connectivity pool, the system automatically sets the new `openapi_port` value of the participant to |

| Role | Description | Notes |
| --- | --- | --- |
| | | `443 + node port offset`, provided that `rolehostd` can bind to the privileged port. |
| `operatorvm` | The `operatorvm` role manages database query plans and executes queries. | Added or removed automatically together with the `sql` or `lts` role. |
| `lts` | The nodes with the `lts` role store data on disk in segments in a column-oriented fashion. The `lts` role is associated with the Foundation Nodes on the system. | Can only be added or removed by adding or removing the node as a participant in a Foundation cluster. |
| `admin` | The `admin` role accepts the administrative protocol and updates system metadata. | Can only be removed if there are at least two other Administrative Nodes. |
| `health` | A node with the `health` role is responsible for maintaining performance-related counters and statistics. | Present initially on every node. Cannot be removed. |

### Example

Add SQL role to the node `sql1`.

SQL

```
ALTER NODE sql1 ADD ROLE sql;
```

## ALTER NODE REMOVE ROLE

`ALTER NODE REMOVE ROLE` removes a role from a node. For a list of roles, see **Node Roles**.

Some node roles cannot be removed using an `ALTER NODE` SQL statement, including `health`, `lts`, and `operatorvm`.

To remove a role, you must be a system-level user.

> The node must be restarted in order for this change to take effect.

If you remove a SQL role from a SQL Node, the database removes the node from the connectivity pool. You must restart all SQL Nodes so that the other SQL Nodes understand that the node is no longer a SQL Node.

When you remove the `admin` role, you must also remove the `/var/opt/ocient/metadataStorage.raft` file.

### Syntax

SQL

```
ALTER NODE [ IF EXISTS ] node_name REMOVE ROLE [ IF EXISTS ]
    { sql | streamloader | admin }
```

| Parameter | Data Type | Description |
|---|---|---|
| `node_name` | string | The name of a node to alter. |

### Example

This example removes the `sql` role from a node.

SQL

```
ALTER NODE my_node REMOVE ROLE sql;
```

## ALTER NODE ALTER CONFIG SET

`ALTER NODE ALTER CONFIG SET` sets a configuration override for the configuration at the node scope. For an explanation of how configuration overrides work, see **Inspect the Current Configuration**.

If the specified path to the configuration setting does not exist, it will be considered a new configuration and appended to the collection of existing configurations. To reset a configuration override for a specific key, use the `RESET` keyword.

### Syntax

SQL

```
-- To set a new configuration override:
ALTER NODE [ IF EXISTS ] node_name
    ALTER CONFIG SET string_definition [=] string_value [,...]

-- To reset a configuration override:
ALTER NODE [ IF EXISTS ] node_name ALTER CONFIG RESET string_definition [,...]
```

| Parameter | Data Type | Description |
|---|---|---|
| `node_name` | string | The name of the specified node to alter. |
| `string_definition` | string | The name of a configuration parameter to alter. Contact Ocient Support for details about altering configuration parameters. |
| `string_value` | string | The new value to be set for the specified configuration parameter. |

### Examples

This example sets the certificate name for this node to `cert_name.crt`.

SQL

```
ALTER NODE node2 ALTER CONFIG SET 'certificateStore.cert' = 'cert_name.crt';
```

This example resets the certificate configuration for the node `node2`.

SQL

```
ALTER NODE node2 ALTER CONFIG RESET 'certificateStore.cert';
```

This example alters the configuration at the node scope for node `node2` for service role `lts`.

SQL

```
ALTER NODE node2 ALTER CONFIG SET 'lts.numLevels' = '3';
```

## ALTER NODE ALTER LOG LEVEL SET

`ALTER NODE node_name ALTER LOG LEVEL SET` sets the log level for a particular logger on the specified node. For an explanation of how configuration overrides work, see **Inspect the Current Configuration**.

The logger name specified can be any string specifying a logger name, or ALL for the root logging configuration. See the **Log Configuration** for more details.

To reset a logger to the default log level (INFO), use the `RESET` keyword.

### Syntax

SQL

```
-- To set a new configuration override:
ALTER NODE [ IF EXISTS ] node_name ALTER LOG LEVEL SET { <logger_parameters> [,...]

<logger_parameters> ::=
    'ALL' | logger_name [=] { 'EDEBUG' | 'DEBUG' | 'VERBOSE' | 'INFO' | 'WARN' | 'E

-- To reset a configuration override:
ALTER NODE [ IF EXISTS ] node_name ALTER LOG LEVEL RESET [ logger_name [,...] ]
```

| Parameter | Data Type | Description |
|---|---|---|
| `node_name` | string | The name of the specified node to alter. |
| `<logger_parameters>` | string | Use `ALL` for the root logging configuration.<br>Otherwise, the `logger_name` parameter can be any string specifying a logger name assigned to a severity level. See the **Log Configuration** page for more details.<br>To reset a logger to the default log level ( `INFO` ), use the `RESET` keyword. |

### Examples

This example alters the log level at the node scope. The example sets the query log level for this particular node to `DEBUG`.

```sql
ALTER NODE node_name ALTER LOG LEVEL SET 'query' = 'DEBUG';
```

This example resets log level for the query logger on the specified node.

```sql
ALTER NODE node_name ALTER LOG LEVEL RESET 'query';
```

## ALTER NODE ALTER METRIC LEVEL

Alters the reporting level of various internal metrics on a specific node. For details about internal metrics, see **Statistics Monitoring**.

To set metrics reporting on all nodes across the system, see **ALTER SYSTEM ALTER METRIC LEVEL**.

### Syntax

```sql
ALTER NODE [ IF EXISTS ] node_name ALTER METRIC LEVEL
    { SET <set_options> | RESET <reset_options> }

<set_options> ::=
    [ LIKE | REGEX ] metric_to_alter [ ,... ] [=] { 'INFO' | 'DEBUG' }

<reset_options> ::=
    { [ LIKE | REGEX ] metric_to_reset [ ,... ] | ALL }
```

| Parameter | Data Type | Description |
|---|---|---|
| `node_name` | string | The name of a node to alter. |

### Set Metric Levels `<set_options>`

The `SET` SQL statement assigns one or more specified metrics to the specified reporting level.

To set levels for a range of statistics, you can use wildcard characters with the `LIKE` keyword. Alternatively, you can use regular expressions with the `REGEX` keyword.

| Parameter | Data Type | Description |
|---|---|---|
| `metric_to_alter` | string | The names of one or more metrics to alter for logging. Enclose any metric names in single quotes. The supported logging level values for metrics are `INFO` and `DEBUG`. Either keyword must be in single quotes. |

## Reset Metric Levels `<reset_options>`

The `RESET` SQL statement reverts one or more specified metrics to the default log level.

You can use wildcard characters with the `LIKE` keyword. Alternatively, you can use regular expressions with the `REGEX` keyword.

Use the `ALL` keyword to revert all metrics to the default log level.

| Parameter | Data Type | Description |
|---|---|---|
| `metric_to_reset` | string | The names of one or more metrics to reset by reverting their log level to the default. To revert all metrics, use the `ALL` keyword. |

### Examples

In this example, the `ALTER NODE` SQL statement sets the `resultCache.queries` metric on the node `oc1` to the `DEBUG` level.

SQL

```
ALTER NODE oc1 ALTER METRIC LEVEL
    SET 'resultCache.queries' = 'DEBUG';
```

This example uses the `LIKE` wildcard keyword to capture any metrics prefixed by `localStorageService.device.smart.` and assign them to the `INFO` level.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

SQL

```
ALTER NODE oc1 ALTER METRIC LEVEL
    SET LIKE 'localStorageService.device.smart.%' 'INFO';
```

Similar to the previous example, this SQL statement uses regular expressions to capture any metrics prefixed by `localStorageService.device.smart.`.

SQL

```
ALTER NODE oc1 ALTER METRIC LEVEL
    SET REGEX 'localStorageService.device.smart.*' 'INFO';
```

This example alters the level of multiple metrics.

SQL

```
ALTER NODE oc1 ALTER METRIC LEVEL
    SET 'resultCache.queries' = 'DEBUG',
        'resultCache.data' = 'INFO',
        LIKE 'localStorageService.device.smart.%' 'INFO';
```

This example resets the same metrics.

SQL

```
ALTER NODE oc1 ALTER METRIC LEVEL
    RESET 'resultCache.queries',
          'resultCache.data',
          LIKE 'localStorageService.device.smart.%';
```

## ALTER NODE SET ADDRESS

`ALTER NODE node_name SET ADDRESS ip_address` changes the internal IP address or hostname for any node. You must restart the system after you change the address. If you change the address of an Administrator Node, then you must update the `bootstrap.conf` file for every node with the new address.

For details about this file, see **Ocient System Bootstrapping**.

### Syntax

```
SQL

ALTER NODE [ IF EXISTS ] node_name SET ADDRESS node_address
```

| Parameter | Data Type | Description |
|---|---|---|
| `node_name` | string | The name of a node to alter. |
| `node_address` | string | The address for a node.<br>This address can be an internal IP address (e.g., `111.11.11.111`) or a DNS hostname with the node address matching the node name (e.g., `sql1`). |

### Examples

This example changes the IP address to `111.11.11.111` for the node named `my_node`.

```
SQL

ALTER NODE my_node SET ADDRESS '111.11.11.111';
```

This example changes the SQL Node `sql1` to use the DNS address `sql1`.

```
SQL

ALTER NODE sql1 SET ADDRESS 'sql1';
```

## NODE TOKEN

Node tokens provide a secure, single-use credential for adding a new node to an existing Ocient System. Instead of embedding administrator credentials in the `bootstrap.conf` file, you can generate a short-lived token on any existing node and use it as the `nodeToken` value on the joining node.

Only one joining node can use each token. After a successful token-based bootstrap, the system overwrites the token value in `bootstrap.conf` with `REDACTED` before renaming the file to `bootstrap.completed`, so the plaintext secret never persists on disk.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

For details about using node tokens in the bootstrap process, see **Node Bootstrapping Reference**.

## GET NODE TOKEN

`GET NODE TOKEN` generates a single-use bearer token for the secure node-bootstrap flow. A new node can use this token to join the cluster without requiring administrator credentials in the `bootstrap.conf` file.

The SQL statement returns a one-row result set. The plaintext token appears only in this response, and the system never logs or persists it.

### Required Privileges

To execute this SQL statement, you must be a member of the `System Administrator` role.

### Syntax

SQL

```
GET NODE TOKEN [ TTL integer { MINUTE[S] | HOUR[S] } ]
```

| Parameter | Data Type | Description |
|---|---|---|
| `integer` | integer | The numeric portion of the requested lifetime for the token. When you omit the `TTL` clause, the server applies the default lifetime of 15 minutes. The minimum accepted value is 1 minute, and the maximum is 24 hours. |

### Result Set

The SQL statement returns a result set with these columns.

| Column | Data Type | Description |
|---|---|---|
| `token` | CHAR | The full plaintext token to set as the `nodeToken` value in `bootstrap.conf`. The token has the format `ont_v1_<token_id>_<secret>` (50 characters, uppercase base32). The server displays this value only once and never persists it. |

| Column | Data Type | Description |
| --- | --- | --- |
| `token_id` | CHAR | The public identifier for the token (16 characters). Use this value with the `REVOKE NODE TOKEN` SQL statement to invalidate the token. |
| `expires_at` | TIMESTAMP | The timestamp when the token expires if the system does not consume it. |

## Examples

### Generate a Node Token with the Default Lifetime

Generate a node token with the default lifetime (15 minutes).

SQL

```
GET NODE TOKEN;
```

Output

```
token                                                | token_id         | expires_at
---------------------------------------------------- | ---------------- | ----------
ont_v1_MFRGGZDF2NZSGC3B_KRSXG5DJNZTX2ZLYMFWXA3DFEQ | MFRGGZDF2NZSGC3B | 2026-08-19 1
```

### Generate a Node Token with an Expiration

Generate a node token that expires in 1 hour.

SQL

```
GET NODE TOKEN TTL 1 HOUR;
```

Output

```
token                                                | token_id         | expires_at
---------------------------------------------------- | ---------------- | ----------
ont_v1_GE3TOMBXHA4DKNZW_MVZXI2LBNF3GK4TTMVRG65DJNB | GE3TOMBXHA4DKNZW | 2026-08-19 1
```

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

## REVOKE NODE TOKEN

`REVOKE NODE TOKEN` invalidates an outstanding, unconsumed node token using its public token identifier `token_id`. Use this SQL statement to revoke a token that was issued but not used, for example, if a bootstrap operation is canceled or if the token is exposed.

### Required Privileges

To execute this SQL statement, you must be a member of the `System Administrator` role.

### Syntax

SQL

```
REVOKE NODE TOKEN 'token_id'
```

| Parameter | Data Type | Description |
|---|---|---|
| `token_id` | string | The public identifier of the token to revoke. This value is the `token_id` value returned by the `GET NODE TOKEN` SQL statement, not the full plaintext token. |

### Example

Revoke a token with the identifier `MFRGGZDF2NZSGC3B`.

SQL

```
REVOKE NODE TOKEN 'MFRGGZDF2NZSGC3B';
```

# SSO INTEGRATION

## CREATE SSO INTEGRATION

Creates a new SSO integration protocol, which can connect to databases as a database integration (see **ALTER DATABASE SET SSO INTEGRATION** ) or connect using a connectivity pool (see **ALTER CONNECTIVITY_POOL SET SSO INTEGRATION**).

### Syntax

SQL

```
CREATE SSO INTEGRATION [IF NOT EXISTS ] sso_name
    PROTOCOL sso_protocol <sso_property> [, ... ]

<sso_property> ::=
    -- literal or string value
    property_name = value |
    -- list of values
    property_name = [ value [, ...] ] |
    -- map of values
    property_name = { key = value [, ...] }
```

| Parameter | Type | Description |
|---|---|---|
| `sso_name` | string | The identifier of the SSO integration to create. |
| `sso_protocol` | string | Supported values are: `oidc`, `openid`, and `openid_connect`.<br>All these values are aliases of each other and use the OAuth 2.0 Authorization. |
| `property_name` | string | One or more properties to include in the SSO integration. Each SSO property must be specified either as a literal, list, or map. See the SSO Properties table for the requirements for each supported SSO parameter.<br>SSO properties also have these rules:<br>You can place any string key or value between double quotations (e.g., `"default_group"`).<br>String values that contain characters other than `[a-zA-z] \| [0-9] \| '_'` require double quotations (e.g., `"this.is.a.complex-$tring"`).<br>Using a NULL value clears the existing configuration of a list or map property (e.g., `user_claim_ids = NULL`). |

## SSO Properties

| Name | Required | Value Type | Default Value | Description |
|---|---|---|---|---|
| `issuer` | Yes | string | None | The **complete U** for the OAuth 2.( and OpenID Connect Authorization Server. This property value is |

| Name | Required | Value Type | Default Value | Description |
| --- | --- | --- | --- | --- |
| | | | | the expected `\"iss\"` claim i access tokens validated by the database. |
| `client_id` | Yes | string | None | The **client identifier** as registered with t OpenID Provider. |
| `client_secret` | Yes | string | None | The **client secr** as registered wit the OpenID Provider. This property is requi for some SSO workflows. |
| `default_group` | Yes | string | None | The group users assigned if no group is specifie the `group_claim_map gs` property for the OpenID Provider. |
| `redirect_host` | No | string | Depends on the connector (pyocient or JDBC). | Specifies the hos name during SS redirection. |
| `redirect_ssl` | No | Boolean | Depends on the connector (pyocient or JDBC). | Set to `true` to enable SSL callb during SSO redirection (i.e., redirect uses `https`). Set to `false` to disable (i.e., redirect uses `http`). |
| `disabled` | No | Boolean | `false` | Set to `true` to disable the OIDC integration for maintenance temporarily. ⚠ If you set this property to `true` all authenticatio |

| Name | Required | Value Type | Default Value | Description |
| --- | --- | --- | --- | --- |
| | | | | requests using th connection fail. |
| `enable_id_token_authentication` | No | Boolean | `false` | Set this property `true` if the identifier token a contains the authorization tok In most circumstances, t option is necessa only for machine to-machine connections with user interaction, such as a server using a script to connect to an Ocient System. |
| `user_id_claims` | No | list of strings (e.g., value [, ...] | [“email”] | Set the claims us to identify users audit trails. The system resolves specified claims from both the ID token and the userinfo endpoin response. If you not set a value, t system uses the `"email"` claim i is present, otherwise it uses `["iss", "sub"]` |
| `additional_scopes` | No | list of strings (e.g., value [, ...] | [] | Specifies additio scopes to reques when executing Authorization Co Flow. |
| `additional_audiences` | No | list of strings (e.g., value [, ...] | [] | Specifies additio audiences to acc when validating tokens. This property is usefu for authorization servers without t token exchange capability. Each additional |

| Name | Required | Value Type | Default Value | Description |
| --- | --- | --- | --- | --- |
| | | | | audience is a cas sensitive URL fro a provider, simila to the `issuer` value. |
| `groups_claim_ids` | No | list of strings (e.g., value [, ...] | [] | Specifies the tok claims that can b used to map the user to a Databa group. If you specify the `groups_claim_ma ngs` property, y must also specify the `groups_claim_id` property. |
| `groups_claim_mappi ngs` | No | map of strings (e.g., key = value [, ...]) | | Specifies mappir from the Provide group to the Database group. |
| `roles_claim_ids` | No | list of strings (e.g., value [, ...] | [] | Specifies the tok claims that can b used to map the user to a Databa role. If you speci the `roles_claim_map gs` property, yo must also specify the `roles_claim_ids` property. |
| `roles_claim_mappin gs` | No | map of strings (e.g., key = value [, ...]) | | Specifies mappir from the Provide role to the Database role. |
| `allowed_groups` | No | list of strings (e.g., value [, ...] | [] | Specifies a list of external identity provider groups that are permitte to authenticate through this SSO integration. If yo specify the `allowed_groups` property, only us |

| Name | Required | Value Type | Default Value | Description |
| --- | --- | --- | --- | --- |
| | | | | who are membe of the specified identify provider groups can acce the Ocient Syste<br><br>If this property is empty or you do not specify it, th group-based filtering is disabl and the system allows all authenticated us from the provide unless they are explicitly blocke Group names mu match exactly as they appear in th claims of the identify provider group. |
| `allowed_roles` | No | list of strings (e.g., value [, ...] | [] | Defines a list of external identity provider roles th are authorized to access the Ocier System through SSO integration. Only users assig to the specified roles in the exte provider can authenticate.<br><br>If this property is empty or you do not specify it, rol based access control is disable for this integrati Role names mus correspond exac to the role claim provided by the identity provider the authenticati response. |

| Name | Required | Value Type | Default Value | Description |
| --- | --- | --- | --- | --- |
| `blocked_groups` | No | list of strings (e.g., value [, ...] | [] | Specifies a list of external identity provider groups that are explicitly denied access through this SSO integration. The system blocks users who are members of any specified group in the external identity provider from authenticating, regardless of other permissions they have. Setting this property takes precedence over the `allowed_groups` property if a user belongs to both an allowed group and a blocked group. Group names must match exactly as they appear in the claims of the identify provider group. |
| `blocked_roles` | No | list of strings (e.g., value [, ...] | [] | Defines a list of external identity provider roles that are explicitly prohibited from accessing the Ocient System through this SSO integration. The system denies access to users assigned to any of the specified roles, overriding any other access permissions. Setting this property takes precedence over |

| Name | Required | Value Type | Default Value | Description |
| --- | --- | --- | --- | --- |
| | | | | the `allowed_roles` property in cases where a user is i both an allowed role and a blocke role. Role names must correspond exactly to the ro claims of the identity provider group. |
| `allow_offline_acce ss` | No | Boolean | `false` | When the `allow_offline_a ss` property is `true`, Ocient requests offline access from the OpenID Connect identity provider including `access_type=off e` and `prompt=consent` the authorizatior URL. |

### Example

This example creates an SSO integration protocol with the specified OpenID issuer `"https://accounts.google.com"`, client identifier, and default group. Each of these parameters is required to create a new SSO integration. The example assumes preset values for the client identifier and default group.

SQL

```
CREATE SSO INTEGRATION sso_test PROTOCOL oidc
    issuer = "https://accounts.google.com",
    client_id = example_database_app_id,
    default_group = example_database_group;
```

## DROP SSO INTEGRATION

Drops an SSO integration protocol.

### Syntax

```
SQL

DROP SSO INTEGRATION [ IF EXISTS ] sso_name
```

| Parameter | Type | Description |
| --- | --- | --- |
| `sso_name` | string | The identifier of the SSO integration to drop. |

### Example

This SQL statement drops the SSO integration protocol `sso_test`.

```
SQL

DROP SSO INTEGRATION sso_test;
```

## ALTER SSO INTEGRATION

Alters an SSO integration protocol by renaming it or modifying its properties.

### Syntax

```
SQL

ALTER SSO INTEGRATION sso_name [ IF EXISTS ] {
    RENAME TO new_name |
    SET <sso_property> [, ... ]
    }

<sso_property> ::=
    -- literal or string value
    property_name = value |
    -- list of values
    property_name = [ value [, ...] ] |
    -- map of values
    property_name = { key = value [, ...] }
```

| Parameter | Type | Description |
| --- | --- | --- |
| `sso_name` | string | The identifier of the SSO integration to alter. |
| `new_name` | string | The new name of the SSO integration. |
| `property_name` | string | One or more properties to include in the SSO integration. Each SSO property must be specified either as a literal, list, or map. See the **SSO Properties** table to see the requirements for each supported SSO parameter.<br>SSO properties also have these rules:<br>You can place any string key or value between double quotations (e.g., `"default_group"`).<br>String values that contain characters other than `[a-zA-z] \| [0-9] \| '_'` require double quotations (e.g., `"this.is.a.complex-$tring"`).<br>Using a NULL value clears the existing configuration of a list or map property (e.g., `user_claim_ids = NULL`). |

### Examples

#### Alter SSO Integration Properties

This example alters the SSO integration to use different properties, changing the OpenID client identifier and the default group to `"group2"`. The example assumes a preset value for the client identifier.

SQL

```
ALTER SSO INTEGRATION sso_test SET
    client_id = different_database_app_id,
    default_group = "group2";
```

#### Rename an SSO Integration

This example renames the SSO integration to `sso_test_2`.

SQL

```
ALTER SSO INTEGRATION sso_test RENAME TO sso_test_2;
```

# STORAGESPACE

# CREATE STORAGESPACE

`CREATE STORAGESPACE` creates a new storage space. The name of the storage space must be distinct from the name of any existing storage spaces in the system.

To create a storage space, you must possess the `CREATE STORAGESPACE` privilege for the current system.

> It is recommended that the total width of a production system be smaller than the number of Foundation Nodes in the cluster so that loading can continue even in the event of a node outage.

## Syntax

SQL

```
CREATE STORAGESPACE [ IF NOT EXISTS ] storage_space_name
    [ WIDTH [=] width_integer], [ PARITY_WIDTH[=] pw_integer ]
```

| Parameter | Data Type | Description |
|---|---|---|
| `storage_space_name` | string | The name of the new storage space.<br>A storage space name must begin with a letter followed by letters, numbers, and underscores. |
| `width_integer` | integer | The total number of nodes to use in each segment group as it is written to disk.<br>Width cannot be greater than the number of nodes in the storage cluster. |
| `pw_integer` | integer | The number of parity coding bits to use for each segment group. This number must be less than `width`.<br>The specified storage space can still complete queries even if nodes are disabled as long as the number of disabled nodes does not exceed the `parity_width`.<br>For example, a storage space with a `width = 5` and a `parity_width = 2` can have up to two nodes become disabled, and the system still uses the three remaining nodes to execute queries. However, if a third node goes down, the system can no longer process query operations. |

## Example

This example creates a new storage space named `ocient`.

SQL

```
CREATE STORAGESPACE ocient WIDTH = 10, PARITY_WIDTH = 2;
```

## DROP STORAGESPACE

`DROP STORAGESPACE` removes an existing storage space, along with all associated tables and views. The SQL statement fails if one or more storage clusters are linked to the storage space.

To remove a storage space, you must possess the `DROP STORAGESPACE` privilege for the storage space. Note that this action cannot be undone.

### Syntax

SQL

```
DROP STORAGESPACE [ IF EXISTS ] storage_space_name [, ...]
```

| Parameter | Data Type | Description |
|---|---|---|
| `storage_space_name` | string | The name of a storage space to drop.<br>You can drop multiple storage spaces by specifying additional storage space names and separating each with commas. |

### Example

Remove an existing storage space named `ocient_ss`.

SQL

```
DROP STORAGESPACE ocient_ss;
```

Remove multiple storage spaces.

SQL

```
DROP STORAGESPACE ocient_ss1, ocient_ss2;
```

## ALTER STORAGESPACE

`ALTER STORAGESPACE RENAME` renames an existing storage space.

To rename a storage space, the logged-in user must be a system-level user.

### Syntax

```
SQL

ALTER STORAGESPACE [ IF EXISTS ] old_storage_space_name RENAME TO new_storage_space
```

| Parameter | Data Type | Description |
|---|---|---|
| `old_storage_space_name` | string | The name of a storage space to rename. |
| `new_storage_space` | string | The new name for the specified storage space. |

### Example

To rename an existing storage space named `teststoragespace` to `storage-space-1`.

```
SQL

ALTER STORAGESPACE "teststoragespace" RENAME TO "storage-space-1";
```

# SYSTEM

## ALTER SYSTEM ALTER CONFIG SET

`ALTER SYSTEM ALTER CONFIG SET` sets an override for the configuration at the system scope. For an explanation of how configuration overrides work, see **Inspect the Current Configuration**.

If the specified path to the configuration setting does not exist, it is considered a new configuration and appended to the collection of existing configurations. To reset a configuration override for a specific parameter, use the `RESET` keyword.

This configuration override is set in the base node configuration by default. To apply the override to a specific service role, prefix the key with the service role name.

### Syntax

```
SQL

-- To set a new configuration override:
ALTER SYSTEM
    ALTER CONFIG SET parameter_name [=] parameter_value [,...]

-- To reset a configuration override:
ALTER SYSTEM
    ALTER CONFIG RESET [ parameter_name [,...] ]
```

| Parameter | Data Type | Description |
|---|---|---|
| `parameter_name` | string | The name of a configuration parameter to alter. This parameter should be a string literal (i.e., enclosed in single quotes).<br>Contact Ocient Support for details about altering configuration parameters. |
| `parameter_value` | any | The new value to be set for the specified configuration parameter.<br>The data type of this value depends on the configuration parameter. This can be a string literal that can be cast to the data type of the configuration parameter. For example, the string literal `'true'` is equivalent to the Boolean value `true`. |

### Examples

This example alters the base configuration of the system scope. The example sets the certificate name for each node in the entire system to `cert_name.crt`.

```
SQL

ALTER SYSTEM ALTER CONFIG SET 'certificateStore.cert' = 'cert_name.crt';
```

This example resets the certificate configuration for the entire system.

```
SQL

ALTER SYSTEM ALTER CONFIG RESET 'certificateStore.cert';
```

This example alters the configuration for the service role `sql`. The `purgeCacheFrequency` setting determines the frequency in seconds to purge the result-set cache of stale values.

```
SQL

ALTER SYSTEM ALTER CONFIG SET 'sql.purgeCacheFrequency' = 600;
```

## ALTER SYSTEM ALTER LOG LEVEL

`ALTER SYSTEM ALTER LOG LEVEL SET` sets the log level for a particular logger for all nodes in the system. For an explanation of how configuration overrides work, see **Inspect the Current Configuration**.

The logger name specified can be any string specifying a logger name, or `ALL` for the root logging config. See the **Log Configuration** for more details.

### Syntax

```
SQL

-- To set a new configuration override:
ALTER SYSTEM ALTER LOG LEVEL SET { <logger_parameters> [,...] }

<logger_parameters> ::=
    'ALL' | logger_name [=] { 'EDEBUG' | 'DEBUG' | 'VERBOSE' | 'INFO' | 'WARN' | 'E

-- To reset a configuration override:
ALTER SYSTEM ALTER LOG LEVEL RESET [logger_name [, ...]]
```

| Parameter | Data Type | Description |
|---|---|---|
| `<logger_parameters>` | string | Use `ALL` for the root logging config.<br>Otherwise, the `logger_name` parameter can be any string specifying a logger name assigned to a severity level. See the **Log Configuration** page for more details.<br>To reset a logger to the default log level ( `INFO` ), use the `RESET` keyword. |

### Example

This example alters the log level at the system scope.

```sql
ALTER SYSTEM ALTER LOG LEVEL SET 'ALL' = 'DEBUG';
```

## ALTER SYSTEM RENAME TO

`ALTER SYSTEM RENAME TO` sets the system name. The system name appears in the `sys.system_information` system catalog table. You can also see the current system name by using the **CURRENT_SYSTEM** function.

### Syntax

```sql
ALTER SYSTEM RENAME TO system_name
```

| Parameter | Data Type | Description |
|---|---|---|
| `system_name` | string | The name of the Ocient System. |

### Example

```sql
ALTER SYSTEM RENAME TO "productionSystem";
```

## ALTER SYSTEM ALTER METRIC LEVEL

Alters the reporting level of various internal metrics across the system, including all nodes. For details about internal metrics, see **Statistics Monitoring**.

To set metrics reporting for individual nodes, see **ALTER NODE ALTER METRIC LEVEL**.

### Syntax

SQL

```
ALTER SYSTEM ALTER METRIC LEVEL
    { SET <set_options> | RESET <reset_options> }

<set_options> ::=
    [ LIKE | REGEX ] metric_to_alter [ ,... ] [=] { 'INFO' | 'DEBUG' }

<reset_options> ::=
    { [ LIKE | REGEX ] metric_to_reset [ ,... ] | ALL }
```

## Set Metric Levels `<set_options>`

The `SET` SQL statement assigns one or more specified metrics to the specified reporting level. You can assign metrics to `INFO` or `DEBUG` levels.

To set levels for a range of statistics, you can use wildcard characters with the `LIKE` keyword. Alternatively, you can use regular expressions with the `REGEX` keyword.

| Parameter | Data Type | Description |
|---|---|---|
| `metric_to_alter` | string | The names of one or more metrics to alter for logging. Enclose any metric names in single quotes. The supported logging levels for metrics are `INFO` and `DEBUG`. Either keyword must be in single quotes. |

## Reset Metric Levels `<reset_options>`

The `RESET` SQL statement reverts one or more specified metrics to the default reporting level.

You can use wildcard characters with the `LIKE` keyword. Alternatively, you can use regular expressions with the `REGEX` keyword.

Use the `ALL` keyword to revert all metrics to the default level.

| Parameter | Data Type | Description |
|---|---|---|
| `metric_to_reset` | string | The names of one or more metrics to reset by reverting their level to the default. To revert all metrics, use the `ALL` keyword. |

### Examples

In this example, the `ALTER SYSTEM` SQL statement sets the `resultCache.queries` metric to the `DEBUG` level.

SQL

```
ALTER SYSTEM ALTER METRIC LEVEL
    SET 'resultCache.queries' = 'DEBUG';
```

This example uses the `LIKE` wildcard to capture any metrics prefixed by `localStorageService.device.smart.` and assign them to the `INFO` level.

SQL

```
ALTER SYSTEM ALTER METRIC LEVEL
    SET LIKE 'localStorageService.device.smart.%' 'INFO';
```

Similar to the previous example, this SQL statement uses regular expressions to capture any metrics prefixed by `localStorageService.device.smart.`.

SQL

```
ALTER SYSTEM ALTER METRIC LEVEL
   SET REGEX 'localStorageService.device.smart.*' 'INFO';
```

This example alters the level of multiple metrics.

SQL

```
ALTER SYSTEM ALTER METRIC LEVEL
    SET 'resultCache.queries' = 'DEBUG',
        'resultCache.data' = 'INFO',
        LIKE 'localStorageService.device.smart.%' 'INFO';
```

This example resets the same metrics.

```sql
ALTER SYSTEM ALTER METRIC LEVEL
    RESET 'resultCache.queries',
          'resultCache.data',
          LIKE 'localStorageService.device.smart.%';
```

## ALTER SYSTEM ALTER SECURITY

Set security settings using the `ALTER SYSTEM ALTER SECURITY` SQL statement. Replace `<security_setting>` with the security setting and `<value>` with the value.

You can inspect the current values of system configuration settings using the `sys.config` and `sys.node_config` system catalog tables.

### Syntax

```sql
ALTER SYSTEM ALTER SECURITY <security_setting> [=] <value>
```

| Parameter | Data Type | Description |
|---|---|---|
| `security_setting` | string | The security setting with values:<br>* `password_minimum_length`<br>* `password_complexity_level`<br>* `password_no_repeat_count`<br>* `password_lifetime_days`<br>* `password_invalid_attempt_limit`<br>For details about these values, see **Database Password Security Settings**. |
| `value` | numeric | An integer to represent one of the security settings. For details about this value, see **Database Password Security Settings**. |

### Examples

#### Set a Security Setting for All Databases

Set the password lifetime to 30 days for the entire system.

SQL

```
ALTER SYSTEM ALTER SECURITY password_lifetime_days = 30;
```

### Set Multiple Security Settings

Set multiple security settings in a single SQL statement. In this case, set the password lifetime to 30 days and the minimum password character length to 12. As with other similar SQL statements, the `=` character is optional.

SQL

```
ALTER SYSTEM ALTER SECURITY
    password_lifetime_days 30,
    password_minimum_length 12;
```

## ALTER SYSTEM SET DEFAULT STORAGESPACE

Sets the specified storage space as the default for creating new tables.

`CREATE TABLE` SQL statements automatically use the default storage space unless you specify a different storage space (see **Table Options**). After you create a table, you cannot alter its assigned storage space. Statements such as `DROP STORAGESPACE` and `ALTER CLUSTER REMOVE STORAGESPACE` throw an error if they attempt to drop the default storage space of the system.

To remove the default storage space, use the optional `RESET` keyword. The `RESET` keyword alters the system to have no default storage space. Until you set a storage space as the new default, `CREATE TABLE` statements throw an error if they do not specify a storage space for the new table.

### Required Privileges

To use this SQL statement, you must have the `ALTER` privilege for the system. For details about privileges, see **Data Control Language (DCL) Statement Reference**.

### Syntax

SQL

```
ALTER SYSTEM { SET | RESET } DEFAULT STORAGESPACE [ storage_space_name ]
```

| Parameter | Data Type | Description |
|---|---|---|
| `storage_space_name` | string | The name of a storage space to set as the system default. This parameter is required when you use the `SET` keyword to define a default storage space.<br><br>Do not include this parameter when you use the `RESET` keyword to remove the default storage space. |

### Examples

#### Set a Default Storage Space

This example sets `ss_0` as the system default storage space.

SQL

```
ALTER SYSTEM SET DEFAULT STORAGESPACE ss_0;
```

#### Remove the Default Storage Space

This example removes any default storage space.

SQL

```
ALTER SYSTEM RESET DEFAULT STORAGESPACE;
```

# Databases

Reference for managing databases in Ocient using SQL DDL, including CREATE DATABASE, ALTER DATABASE, and DROP DATABASE syntax with examples and options.

This group of DDL SQL statements allows database administrators to manage databases. Database administrators can create and modify databases, including SSO authentication settings. You can view information about databases using the `sys.databases` system catalog table.

For information on database components, see the pages on **Schemas**, **Tables**, **Views**, and **Indexes**.

## CREATE DATABASE

`CREATE DATABASE` creates a new database. The database name must be distinct from the name of any existing database in the system.

To create a database, you must have the `CREATE DATABASE` privilege for the current system.

### Syntax

SQL

```
CREATE DATABASE [ IF NOT EXISTS ] database_name
```

| Parameter | Type | Description |
|---|---|---|
| `database_name` | string | A unique identifier for the database. The system generates an error if you specify a duplicate name.<br>`system` is a reserved database name and can neither be created nor dropped. |

### Example

Create a new database named `ocient`.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

SQL

```
CREATE DATABASE ocient;
```

# DROP DATABASE

`DROP DATABASE` removes an existing database. This SQL statement also disconnects all users currently connected to the database.

To remove a database, you must have the `DROP DATABASE` privilege for the current database.

You cannot drop a database while it has any `PIPELINE` in a running status.

> ⚠ The `DROP DATABASE` SQL statement removes the existing database and all created users, tables, and views.
>
> This action cannot be undone.

## Syntax

SQL

```
DROP DATABASE [ IF EXISTS ] database_name [, ...]
```

| Parameter | Type | Description |
|---|---|---|
| `database_name` | string | An identifier for the database to be dropped.<br>You can drop multiple databases by specifying additional database names and separating each with commas.<br>`system` is a reserved database name and can neither be created nor dropped. |

## Example

Remove an existing database named `ocient`.

SQL

```
DROP DATABASE ocient;
```

# ALTER DATABASE

## ALTER DATABASE RENAME

`ALTER DATABASE RENAME` renames an existing database.

To rename a database, you must have the `ALTER DATABASE` privilege for the database.

### Syntax

```
SQL

ALTER DATABASE old_database_name RENAME TO new_database_name
```

| Parameter | Type | Description |
|---|---|---|
| `old_database_name` | string | The old identifier of the database for the rename. |
| `new_database_name` | string | The new identifier of the database for the rename. |

### Example

Rename an existing database named `oracle` to `ocient`.

```
SQL

ALTER DATABASE oracle RENAME TO ocient;
```

## ALTER DATABASE SET SSO INTEGRATION

`ALTER DATABASE SET SSO INTEGRATION` configures the database to authenticate using an external SSO provider. This SSO integration is the default for connections unless you use a connectivity pool or specify a different provider.

To set a connection, you must be a system-level user or a database administrator and have an open connection to the database.

This SQL statement is an alias for **ALTER DATABASE ALTER SSO INTEGRATION**.

See **Configuring the Ocient Database** for details about configuring SSO protocols.

If your Ocient® System is version 25.0 or later, you can create multiple SSO integrations for each database. An SSO integration assigned to the database by the `ALTER DATABASE` SQL statement is the primary SSO connection, unless you connect to the database with a connectivity pool that has a different SSO integration assigned to it.

### Syntax

SQL

```
ALTER DATABASE database
    ALTER SSO INTEGRATION sso_name
```

| Parameter | Type | Description |
|---|---|---|
| `database` | string | The identifier of the database for configuration. |
| `sso_name` | string | The identifier of the SSO integration to use. |

### Example

This example sets an example database to use the SSO integration named `sso_test`.

SQL

```
ALTER DATABASE example_database
    SET SSO INTEGRATION sso_test;
```

## ALTER DATABASE ALTER SSO INTEGRATION

`ALTER DATABASE ALTER SSO CONNECTION` configures the database to authenticate using an external SSO provider. This SSO integration is the default for connections unless you use a connectivity pool or specify a different provider.

To alter a connection, you must be a system-level user or a database administrator and have an open connection to the database.

This SQL statement is an alias for **ALTER DATABASE SET SSO INTEGRATION**.

See **Configuring the Ocient Database** for details about configuring SSO protocols.

If your Ocient System is version 25.0 or later, you can create multiple SSO integrations for each database. An SSO integration assigned to the database by the `ALTER DATABASE` SQL statement is the primary SSO connection, unless you connect to the database with a connectivity pool that has a different SSO integration assigned to it.

### Syntax

SQL

```
ALTER DATABASE database
    ALTER SSO INTEGRATION sso_name
```

| Parameter | Type | Description |
|---|---|---|
| `database` | string | The identifier of the database for configuration. |
| `sso_name` | string | The identifier of the SSO integration to use. |

### Example

This example alters an example database to use the SSO integration named `sso_test`.

SQL

```
ALTER DATABASE example_database
    ALTER SSO INTEGRATION sso_test;
```

## ALTER DATABASE REMOVE SSO INTEGRATION

`ALTER DATABASE REMOVE SSO INTEGRATION` removes an existing SSO integration as the default connection protocol for the database. This action effectively undoes the **ALTER DATABASE ALTER SSO INTEGRATION** SQL statement.

To remove a connection, you must be a system-level user or a database administrator.

### Syntax

SQL

```
ALTER DATABASE database REMOVE SSO INTEGRATION
```

| Parameter | Type | Description |
| --- | --- | --- |
| `database` | string | The identifier of the database for deletion. |

### Example

Remove the default connection from the database named `example_database`.

SQL

```
ALTER DATABASE example_database REMOVE SSO INTEGRATION;
```

## ALTER DATABASE ALTER SECURITY

Sets the security settings at the database level using the `ALTER DATABASE ALTER SECURITY` SQL statement. Replace `<security_setting>` with the security setting and `<value>` with the value.

### Syntax

SQL

```
ALTER DATABASE database ALTER SECURITY <security_setting> [=] <value>
```

| Parameter | Data Type | Description |
| --- | --- | --- |
| `database` | string | The identifier of the database for setting security settings. |
| `security_setting` | string | The security setting with values:<br>* `password_minimum_length`<br>* `password_complexity_level`<br>* `password_no_repeat_count`<br>* `password_lifetime_days`<br>* `password_invalid_attempt_limit`<br>For details about these values, see **Database Password Security Settings**. |
| `value` | numeric | An integer to represent one of the security settings. For details about this value, see **Database Password Security Settings**. |

### Example

Set the password lifetime to 20 days for the database `example_db`.

```sql
ALTER DATABASE example_db
    ALTER SECURITY password_lifetime_days = 20;
```

# Schemas

Manage schemas in Ocient using SQL DDL, including CREATE SCHEMA, ALTER SCHEMA, and DROP SCHEMA, plus guidance on namespacing tables, views, and indexes.

This group of DDL SQL statements allows database administrators to manage schema design. Database administrators can create, modify, and drop schemas. You can view information about the schema using the `sys.schemas` system catalog table.

For information on other database components, see the pages on **Databases**, **Tables**, **Views**, and **Indexes**.

## Implicit and Explicit Schemas

The Ocient® System creates implicit schema objects when you execute the `CREATE` or `ALTER` SQL statements on a table, view, or machine learning model in the database, and there is no destination schema for those objects. For example, in the `ALTER TABLE schema1.table1 RENAME to schema2.table1` statement, if `schema2` does not exist in the database, the system creates `schema2` as an implicit schema object. When the system creates the implicit schema, the system grants the `VIEW` privilege on the schema to the Public role of the database where the schema is created.

The system creates explicit schema objects when you execute a `CREATE SCHEMA` SQL statement or promote an implicit schema using the `ALTER SCHEMA` SQL statements or the `GRANT` SQL statement on the schema.

To execute SQL statements on objects or view the metadata of objects in an explicit schema, you must have the `VIEW SCHEMA` privilege and the basic required privileges for the statement. For an implicit schema, you do not need any additional privileges.

To create an object, if the schema is implicit, then you need the `CREATE object ON DATABASE` privilege, where `object` can be a table, view, or machine learning model. If the schema is explicit, then you need the `CREATE object ON SCHEMA` privilege.

You can check the disposition of the schema using the `is_implicit` column in the `sys.schemas` system catalog table.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

After promotion, you cannot demote an explicit schema back to an implicit one.

# CREATE SCHEMA

`CREATE SCHEMA` defines an explicit schema. To use the optional `OR REPLACE` SQL statement, the schema must not contain other objects.

### Required Privileges

Users with the `CREATE SCHEMA` privilege on the database can create an explicit schema.

After you create an explicit schema, ensure to specify the privileges for each user. For details, see **Data Control Language (DCL) Statement Reference**.

### Syntax

SQL

```
CREATE [ OR REPLACE ] SCHEMA [ IF NOT EXISTS ] schema_name
```

| Parameter | Type | Description |
|---|---|---|
| `schema_name` | string | An identifier for the schema to create. The name must be distinct from any existing schema in the database unless you specify the `REPLACE` keyword.<br><br>`sys`, `sysgdc`, `syslookup`, and `information_schema` are reserved schema names and can neither be created nor dropped. |

### Example

Define the `sandbox` schema.

SQL

```
CREATE SCHEMA sandbox;
```

# ALTER SCHEMA RENAME

`ALTER SCHEMA RENAME` renames an existing schema. If you use this statement with an implicit schema, the system promotes the implicit schema to an explicit schema.

### Required Privileges

To rename a schema, you must have the `VIEW` and `ALTER` privileges for the schema.

The Ocient System requires these privileges if this statement includes a change to the schema:

- `VIEW` and `ALTER` privilege on the current schema
- `CREATE SCHEMA` privilege on the database

### Syntax

```
SQL

ALTER SCHEMA [ IF EXISTS ] old_schema_name RENAME TO new_schema_name
```

| Parameter | Type | Description |
|---|---|---|
| `old_schema_name` | string | The old identifier of the schema for rename. |
| `new_schema_name` | string | The new identifier of the schema for rename. The name must be distinct from the name of any existing schema in the system. |

### Example

Rename an existing schema named `sandbox` to `ocient`.

```
SQL

ALTER SCHEMA sandbox RENAME TO ocient;
```

## DROP SCHEMA

`DROP SCHEMA` removes an existing schema. The Ocient System automatically removes an implicit schema when you remove all its contents. However, an explicit schema persists even without any objects.

If the existing schema contains objects and you do not specify the `CASCADE` keyword, the system cannot remove this schema. Otherwise, the system removes all objects inside the existing schema.

### Required Privileges

If the schema is explicit, you must have the `DROP SCHEMA` privilege. Otherwise, if the schema is implicit, the schema must not contain any objects, or if you specify the `CASCADE` keyword, you must have the `VIEW` and `DROP` privileges for all objects in the schema to remove it.

### Syntax

SQL

```
DROP SCHEMA [ IF EXISTS ] schema_name [, ...] [ CASCADE ]
```

| Parameter | Type | Description |
|---|---|---|
| `schema_name` | string | An identifier for the schema to remove.<br><br>You can drop multiple schemas by specifying additional schema names and separating each with commas.<br><br>`sys`, `sysgdc`, `syslookup`, and `information_schema` are reserved schema names and can neither be created nor dropped. |

### Example

Remove an existing schema named `ocient`.

SQL

```
DROP SCHEMA ocient;
```

# Tables

Manage tables in Ocient with SQL DDL, including CREATE TABLE, ALTER TABLE, and DROP TABLE, plus guidance on time keys, clustering keys, and partitioning.

This group of DDL SQL statements allows database administrators to manage tables. Database administrators can create, modify, drop, and export tables. You can also truncate segments on a table. Additional statements are available for unique settings like segment redundancy, compression settings, and streamloader properties. You can view information about tables using the `sys.tables` system catalog table.

For information on other database components, see the pages on **Databases**, **Schemas**, **Views**, and **Indexes**.

## CREATE TABLE

Creates a new table in the current database.

The table name must be distinct from the name of any existing tables in the database unless the `REPLACE` keyword is specified. To use `REPLACE` in the `CREATE TABLE` statement, you must have `DELETE` privileges.

By default, columns are nullable unless otherwise specified.

For faster query results, you can define one TimeKey® for the table, which must be a timestamp, date, or time column, with a specified bucket resolution. Tables with a specified TimeKey can perform query operations faster, especially if they involve time filtering.

You can specify a Clustering Key composed of one or more fixed-length columns. Designating columns as cluster keys that are frequently referenced in queries can greatly improve performance.

For details about defining TimeKeys and clustering indexes, see **TimeKeys and Clustering Keys**.

See the **Data Types** section for table-supported data types.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

**Required Privileges:** You must have the `CREATE TABLE` privilege for the current database.

For examples, see **CREATE TABLE SQL Statement Examples**.

### Syntax

SQL

```
CREATE [ OR REPLACE ] TABLE [ IF NOT EXISTS ] table_name
    [ ( <column_definition> [, ...] | <clustering_definition> ) ]
    [ [ WITH ] <create_option> [, ... ] ]
    [ AS (query) ]

<column_definition> ::=
   column_name [ data_type ] [ <timekey_definition> ] [ <column_constraint> ] [, ..

<timekey_definition> ::=
  TIME KEY BUCKET (bucket_granularity, bucket_value)

<column_constraint> ::=
   | [ NOT ] NULL
   | DEFAULT expression
   | COMMENT comment
   | COMPRESSION GDC [ (compression_value), EXISTING schema_name ]
   | COMPRESSION [ compression_scheme ]

<clustering_definition> ::=
    CLUSTERING KEY key_name (ck_col1, ck_col2 [, ...])
        [, INDEX index_name (idx_col1, idx_col2 [, ...])
        [, INDEX ... ] ]

 <create_option> ::=
   INDEX index_name (index_column) [ USING index_type ]
   | RETENTION POLICY AGE retention_granularity retention_value
   | STORAGESPACE storage_space_name
   | SEGMENTSIZE segment_value
   | REDUNDANCY segment_part (redundancy_scheme)
   | STREAMLOADER_PROPERTIES streamloader_json
   | COMMENT '<string>'
```

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Parameter | Type | Description |
|---|---|---|
| `table_name` | string | A unique identifier for the table.<br>`table_name` must be distinct from the name of any existing tables in the database unless the `REPLACE` keyword is specified. |
| `query` | string | A `SELECT` query used to load data into the newly created table.<br>For details, see **CREATE TABLE AS SELECT** . |

## Column Definition ( `<column_definition>` )

The parameters listed here are required for defining each column in a table.

| Parameter | Type | Description |
|---|---|---|
| `column_name` | string | An identifier for a column to be included in the newly created table. |
| `data_type` | string | The data type of a specified column. For a list of supported data, see **Data Types**. |

## Clustering Key and Index Definition ( `<clustering_definition>` )

The parameters listed here are required for defining a Clustering Key or clustering indexes on a table.

For details about how to apply clustering columns, see **Clustering Key**.

SQL

```
CLUSTERING KEY key_name (ck_col1, ck_col2 [, ...])
    [, INDEX index_name (idx_col1, idx_col2 [, ...])
    [, INDEX ... ] ]
```

| Parameter | Type | Description |
|---|---|---|
| `key_name` | string | An identifier for the Clustering Key. |
| `ck_col1, ck_col2 [, ...]` | string | A series of specific columns comprising the Clustering Key.<br>Clustering Key columns must not be nullable. Specify |

| Parameter | Type | Description |
| --- | --- | --- |
| | | `NOT NULL` in the column definition for the respective columns. For details, see **Column Definition**.<br>No limit exists on the number of columns for the Clustering Key. |
| `index_name` | string | Optional.<br>An identifier for a clustering index.<br>You must include the definition of columns that comprise the index using the `idx_col1, idx_col2 [, ...]` parameter. |
| `idx_col1, idx_col2 [, ...]` | string | Optional.<br>A series of specific columns comprising a clustering index.<br>You can apply clustering indexes only to columns included in the Clustering Key. Specify any number of columns in any specified order.<br>You must include the identifier for the index using the `index_name` parameter. |

## TimeKey Definition ( `<timekey_definition>` )

This syntax example is for a single TimeKey column, which can be included in the column definition of a `CREATE TABLE` statement. For the full syntax, see **CREATE TABLE**.

For details about using TimeKeys, see **TimeKeys**.

SQL

```
column_name [ data_type ] TIME KEY BUCKET (bucket_granularity, bucket_value [, NOIN
```

| Parameter | Type | Description |
| --- | --- | --- |
| `column_name` | string | An identifier for the column. |
| `data_type` | string | Optional.<br>The data type of the column.<br>For the TimeKey column, this column should be DATE or TIMESTAMP type. The TimeKey column can also support INT or BIGINT type, but these data types do not use a `bucket_value` argument. |
| `bucket_granularity` | numeric | The granularity of the TimeKey column, based on the specified TIME type in `bucket_value`. |

| Parameter | Type | Description |
| --- | --- | --- |
| `bucket_value` | string | The TIME type to parse the TimeKey column. Supported values include: `[ DAY, HOUR, MINUTE, SECOND ]` For example, `BUCKET(1, DAY)` sets the time-bucket granularity to a fixed width of one day. |

## Column Constraint ( `<column_constraint>` )

The parameters listed here include constraints and other configurations for individual columns. For best performance, one column with date or time data in each table should be defined as the `TIME KEY` with a specified `bucket_value`.

For details about TimeKey columns, see **TimeKeys**.

| Parameter | Type | Description |
| --- | --- | --- |
| `expression` | data type of the column | If you specify this parameter as a constraint, the parameter sets the default value for the column. The value can be a literal or a constant, deterministic expression. Default expressions cannot use non-deterministic functions such as `RAND()`. The system evaluates the expression at the time of table creation and stores the resulting value. If the expression result does not match the column data type, the system automatically attempts type coercion to convert it.<br><br>**Literals Usage** — The value can be a literal enclosed in quotes or an unquoted numeric literal. For example, this `CREATE TABLE` SQL statement includes a default value for its `UUID` column.<br><br>`CREATE TABLE example_table ( col1 UUID NOT NULL DEFAULT '00000000-0000-0000-0000-000000000000' );`<br><br>The supported geospatial data types `POINT`, `LINESTRING`, and `POLYGON` require WKT formatting. For formatting examples, see the **Well-known text representation of geometry**.<br><br>**Expressions Usage** — The value can also be an expression that evaluates to a constant, such as an arithmetic operation or a function execution.<br><br>For example, this `CREATE TABLE` statement uses two default expressions. The column `col1` uses a math equation that evaluates to `104`. The column `col2` concatenates two strings using the `CONCAT` function to create the new string `'HEYYOU'`. |

| Parameter | Type | Description |
| --- | --- | --- |
| | | `CREATE TABLE example_table ( col1 INT DEFAULT 4 + (5 * 20), col2 VARCHAR DEFAULT CONCAT('HEY', 'YOU') );` |
| `comment` | string | An optional comment for the column. |
| `compression_value` | numeric | An integer value of either `1`, `2` or `4` is used to define the storage of `COMPRESSION GDC`. The compression of the values is defined as follows:<br>- A `compression_value` of 1 can hold up to 255 unique values.<br>- A `compression_value` of 2 can hold up to 65535 unique values.<br>- A `compression_value` of 4 can hold millions of unique values.<br>For tuple columns, compression is specified for each tuple value rather than with other constraints. The example here defines a tuple column with GDC compression only for the first inner `VARCHAR` value.<br>`my_tuple TUPLE<<INT, VARCHAR(255) COMPRESSION GDC(1), VARCHAR(255)>>`<br>It is not recommended to use compression on a column that will contain more than one million unique values. |
| `schema_name` | string | Fully qualified column name or a column name if you specify a column in the same table.<br>If `EXISTING` is specified as a compression constraint, the compression GDC reuses the system lookup table for the `schema_name` column, rather than creating a new one. The existing column must be in the same database as the new column.<br>`schema_name` should include the schema, table, and column names, each separated by periods and enclosed in double-quotation marks, for example:<br>`"schema_name"."table_name"."column_name"`<br>If an existing column is specified, any new column that uses the existing column's system lookup table must be deleted before the existing column can be deleted. |
| `compression_schem e` | string | The type of compression used for the column. Supported values include:<br>`[ COMPRESSION NONE \| COMPRESSION ZSTD \| COMPRESSION DYNAMIC ]`<br>If no compression setting is specified, the compression defaults to `COMPRESSION DYNAMIC` for fixed-length columns and `COMPRESSION NONE` for variable-length columns. `COMPRESSION ZSTD` applies to `VARCHAR` columns as well as other data types.<br>For the `COMPRESSION DYNAMIC` setting, the Ocient® System applies LZ4 compression only if the column data is dynamically determined to be compressible. For fixed-length columns, `COMPRESSION DYNAMIC` applies delta-delta |

| Parameter | Type | Description |
|---|---|---|
| | | compression.<br>For details about Ocient-supported compression schemes, see **Table Compression Options**. |

## Create Option ( `<create_option>` )

The parameters listed here include various options to configure table storage space, segments, redundancy, streamloading, and indexes.

| Parameter | Type | Description |
|---|---|---|
| `index_name` | string | An identifier for the index.<br>The name must be distinct from the name of any existing index on the table. |
| `index_column` | string | The name of the column for the index.<br>Identical indexes on the same column are not allowed. A column can only have multiple indexes if they are of different types or parameters. |
| `index_type` | string | Optional.<br><br>One of these supported secondary index types:<br>`INVERTED \| HASH \| NGRAM \| SPATIAL \| ZONE_MAP`<br><br>If unspecified, this value defaults to an index type based on its data type. For details, see **Index Type Requirements and Defaults**. |
| `retention_granularity` | numeric | A number that represents the amount of time before the system deletes data in the table. You must pair this number with a specific time type, represented by the `retention_value` parameter.<br><br>For details about setting up retention policies, see **Table Retention Policies**. |
| `retention_value` | string | The unit of time that represents how long the table retains data. Supported values are: `WEEK`, `DAY`, `HOUR`, `MINUTE`, `SECOND`, `MILLISECOND`<br><br>You must pair this number with the amount of time, represented by the `retention_granularity` parameter.<br><br>For example, `1 DAY` schedules the table retention to a granularity of one day. |
| `storage_space_name` | string | An identifier for the `STORAGESPACE`. |

| Parameter | Type | Description |
| --- | --- | --- |
| `segment_value` | numeric | A value to define the size of the segment. |
| `segment_part` | string | Specifies the segment part redundancy of the table. Supported values include: `\{ DATA \| MANIFEST \| INDEX \| SUMMARY_STATS \| STATS }` These settings are defined as follows: `DATA` : The actual data for the table. `MANIFEST` : Header information stored about the data, which describes how to locate any specified cluster of rows within the data. `INDEX` : The index of the data used for quicker lookups and better query performance. `SUMMARY_STATS` : A collection of statistics on the data that includes compression, row count, and average column size. `STATS` : Used in the optimizer, the probability density function and combinable distinct estimators used to make better optimizations to query plans. |
| `redundancy_scheme` | string | The redundancy scheme. Supported values include: `\{ COPY \| PARITY }` These settings are defined as follows: `COPY` : A copy of the bytes is stored throughout the storage cluster to ensure redundancy. This option uses more storage but is faster during rebuilds and node outages. `PARITY` : Using the parity encoding specified on the storage cluster, this option uses parity bits to ensure redundancy for the data. This option uses less storage but is slower during rebuilds and node outages. |
| `streamloader_json` | string | A JSON string that defines the streamloader parameters. For details, see **ALTER TABLE STREAMLOADER PROPERTIES**. |

## Example

This example creates a new table in the current database and schema named `trades`.

The table uses the TIMESTAMP column `created_at` as the TimeKey, with the granularity set at 1 hour. The columns `ticker_symbol` and `t_type` are defined as the table clustering keys. The example also includes a streamloader property `pageQueryExclusionDuration` to delay how soon data pages that were recently added can be included in query results.

SQL

```
CREATE TABLE trades (
    id UUID NOT NULL,
    ticker_symbol VARCHAR(255) NOT NULL COMPRESSION GDC(2),
    t_type VARCHAR(255) NOT NULL COMPRESSION GDC(1),
    raw_ticker_data VARCHAR(255),
    created_at TIMESTAMP NOT NULL TIME KEY BUCKET(1, HOUR),
    array_of_tuples tuple<<varchar(2040), byte, bigint, double, timestamp, date, ti
    CLUSTERING INDEX idx_ticker_symbol_type (ticker_symbol, t_type),
    INDEX idx_type (t_type)
)
    STORAGESPACE ocient_storage,
    REDUNDANCY DATA (PARITY),
    REDUNDANCY MANIFEST (COPY),
    STREAMLOADER_PROPERTIES '{
    "pageQueryExclusionDuration" : "2700s"
}';
```

## CREATE TABLE AS SELECT (CTAS)

CTAS provides the ability to create and load a new table from the result of a query on one or more existing tables. The first column of the query result maps to the first column of the new table definition, the second column maps to the second column of the new table, and so on. The new table is available for querying after it has been created, and the entire result set from the query has been loaded into the table. When you receive a response to the CTAS SQL statement, the load is complete, and the table is ready.

When you create a table from a `SELECT` SQL statement, the schema for the table can be automatically determined based on the query results. You can override this behavior with an alternative schema, provided the query results can automatically be cast to the target column types. CTAS also supports all syntax options for the new table. CTAS does not support default values and explicit nullable definitions on the column of the table.

CTAS statements support secondary and prefix indexes.

To create a table, you must have both the `CREATE TABLE` privilege for the current database and the `SELECT` privilege on all referenced tables and views.

For syntax and parameter information, see **CREATE TABLE**.

## Default Table Definitions

By default, a new table created with a CTAS statement retains column names, data types, and nullable definitions from the queried table. You can override this configuration with alternate table definitions in the CTAS statement.

> ⚠ Tables created by a CTAS statement do not inherit some table definitions from the original table, including the following:
>
> - TimeKey
> - Clustering Key and Clustering indexes
> - Secondary indexes
> - Column compression
> - Optional table configurations (see **create option**)
>
> To include these table definitions, you must explicitly specify them in the CTAS statement.

### Examples

These CTAS examples select columns from the `original_table` table that this `CREATE TABLE` statement defines. This table contains these columns:

- `col_int` — Non-nullable integer with the default value `123456789`
- `col_bigint` — Non-nullable eight-byte signed integer
- `col_id` — Non-nullable integer
- `col_point` — Non-nullable point with the default value `POINT(0 0)`
- `col_timestamp` — Non-nullable TimeKey with granularity set at 1 day
- `col_varchar` — Variable-length character string with a maximum length of 255 characters and Zstandard compression

The table has a Clustering Key `ck` using the `col_bigint` and `col_id` columns. It also has two secondary indexes: a `hash` index `idx_01` on the `col_varchar` column and a `spatial` index on the `idx_02` column.

SQL

```
CREATE TABLE original_table (
    col_int INT NOT NULL DEFAULT 123456789,
    col_bigint BIGINT NOT NULL,
    col_id INT NOT NULL,
    col_point POINT NOT NULL DEFAULT 'POINT(0 0)',
    col_timestamp TIMESTAMP TIME KEY BUCKET (1,DAY) NOT NULL,
    col_varchar VARCHAR(255) COMPRESSION ZSTD,
    CLUSTERING KEY ck (col_bigint, col_id)
)
WITH
    INDEX idx_01 (col_varchar) USING HASH,
    INDEX idx_02 (col_point) USING SPATIAL;
```

### CTAS Using All Columns from a Base Table

This example shows a basic CTAS statement that inherits most of its table definition from the `original_table` table.

SQL

```
CREATE TABLE basic_ctas AS (
    SELECT * FROM original_table );
```

The new `basic_ctas` table includes all the columns and data types from the original table definition. However, it does not include the segment keys, indexes, or the compression on the `col_varchar` column. The `EXPORT TABLE` SQL statement shows the differences in the `basic_ctas` table.

SQL

```
EXPORT TABLE basic_ctas;
```

Output

Text

```
CREATE TABLE basic_ctas (
    "col_int" INT NOT NULL,
    "col_bigint" BIGINT NOT NULL,
    "col_id" INT NOT NULL,
    "col_point" POINT NOT NULL,
    "col_timestamp" TIMESTAMP NOT NULL,
    "col_varchar" VARCHAR(536870912) COMPRESSION DYNAMIC NULL
)
REDUNDANCY cde (PARITY),
REDUNDANCY column_metadata (COPY),
REDUNDANCY data (PARITY),
REDUNDANCY index (PARITY),
REDUNDANCY pdf (PARITY),
REDUNDANCY skip_lists (COPY),
REDUNDANCY stats (PARITY),
REDUNDANCY summary_stats (PARITY),
REDUNDANCY table_of_contents (COPY),
STORAGESPACE "ss0",
SEGMENTSIZE 4;
```

In this output, the table options for `REDUNDANCY`, `STORAGESPACE`, and `SEGMENTSIZE` are all default table settings.

### CTAS Using a Full Table Definition

This example CTAS statement includes a more detailed table definition. The definition includes new columns for the TimeKey, Clustering Key, and secondary indexes. The example also makes various changes from the `original_table` schema:

- Different column default value
- Different compression scheme (dynamic compression)
- New TimeKey granularity of 1 hour
- Three columns in the Clustering Key
- Different secondary index types ( `NGRAM` and `SPATIAL` )

© 2026 Ocient, Inc

SQL

```sql
CREATE TABLE complex_ctas (
    col_amt INT NOT NULL,
    col_phone BIGINT NOT NULL COMPRESSION DYNAMIC,
    col_id INT NOT NULL,
    col_point POINT NOT NULL DEFAULT 'POINT(0 0)',
    col_timestamp TIMESTAMP TIME KEY BUCKET (1,HOUR) NOT NULL,
    col_varchar VARCHAR(255) COMPRESSION DYNAMIC,
    CLUSTERING KEY ck (col_amt, col_phone, col_id)
)
WITH
    INDEX idx_01 (col_varchar) USING NGRAM(3),
    INDEX idx_02 (col_point) USING SPATIAL
AS (
    SELECT * FROM original_table );
```

### CTAS Using a Subset of Table Columns

This example selects only a subset of columns, `col_int`, `col_bigint`, and `col_id`, from the original table to insert into the new `subset` table. The example also specifies alternate table options for `REDUNDANCY` and `SEGMENTSIZE`.

SQL

```sql
CREATE TABLE subset (
    col_amt INT NOT NULL,
    col_phone BIGINT NOT NULL,
    col_id INT NOT NULL
)
WITH
    REDUNDANCY cde (PARITY),
    SEGMENTSIZE 3
AS (
    SELECT
        col_int,
        col_bigint,
        col_id
FROM
    original_table );
```

Due to limitations of the JDBC API, the reported modified row count might not be accurate for tables larger than two billion rows.

### CTAS Using Transformations on Columns

This example performs various transformation functions on the original columns as it selects them for the new table. These include:

- `col_int_multiply` column is the multiplication of the `col_int` values by 10.
- `col_month_add` column is the result of adding three months to each `col_timestamp` column value.
- `col_year` column is the extraction of the year value from each `col_timestamp` column value.
- `col_substring` column contains the first three characters from each `col_varchar` column value.

SQL

```
CREATE TABLE calc_table (
    col_int_multiply INT NOT NULL,
    col_month_add TIMESTAMP NOT NULL,
    col_year INT NOT NULL,
    col_substring VARCHAR(255)
)
AS (
    SELECT
        col_int * 10,
        ADD_MONTHS(col_timestamp, 3),
        YEAR(col_timestamp),
        SUBSTRING(col_varchar, 1, 3)
FROM
    original_table );
```

## CTAS USING LOADERS

Specify one or more Loader Nodes for executing the CTAS SQL statement. If you do not use this option, the Ocient System uses all Loader Nodes that are live to execute the SQL statement.

This statement is useful for managing loading operations, particularly when balancing multiple loads of different sizes and resource requirements. Alternatively, this statement can also help simplify small batch loads by sourcing the data from a single Loader Node.

### Syntax

| Parameter | Type | Description |
|---|---|---|
| `streamloader` | string | A unique name for the Loader Node.<br>Identify the names of Loader Nodes from the `sys.nodes` table by using this query: `SELECT name FROM sys.nodes;`<br>If the name of the Loader Node contains special characters, you must enclose it in quotes, such as `"stream-loader1"`. |
| `query` | string | A `SELECT` query that defines values or a table and any of its columns to use for data in the specified `table_name` table. |

For the query to execute successfully, the specified names of the Loader Nodes must:

- Identify nodes that are live.
- Identify nodes that have the Loader role.

### Examples

Create a table named `my_schema.my_ctas_table_2` with a clustering index named `idx` on the `int_col` column with the values in the `int_col` column in the table named `my_schema.my_table`. Use the Loader Node named `stream-loader1` to execute this SQL statement.

SQL

```
CREATE TABLE my_schema.my_ctas_table_2 (
   CLUSTERING INDEX idx (int_col)
 )
 USING LOADERS "stream-loader1"
 AS (SELECT int_col FROM my_schema.my_table);
```

In this example, execute the same CTAS SQL statement with two Loader Nodes named `stream-loader2` and `stream-loader3`.

SQL

```
CREATE TABLE my_schema.my_ctas_table_2 (
   CLUSTERING INDEX idx (int_col)
 )
 USING LOADERS "stream-loader2","stream-loader3"
 AS (SELECT int_col FROM my_schema.my_table);
```

# DROP TABLE

`DROP TABLE` removes one or more existing tables in the current database, along with all associated views.

ⓘ This action cannot be undone.

To remove a table, the logged-in user must be a system-level user or have the `DELETE TABLE` privileges for the table.

### Syntax

SQL

```
DROP TABLE [ IF EXISTS ] table_name [, ...]
```

| Parameter | Type | Description |
|---|---|---|
| `table_name` | string | A unique identifier for the table.<br>You can drop multiple tables by specifying additional table names and separating each with commas. |

### Examples

This example drops an existing table in the current database and schema named `employees`.

SQL

```
DROP TABLE employees;
```

In this example, drop two tables in the current database and schema named `employees` and `departments`.

```
SQL

DROP TABLE employees, departments;
```

When you drop multiple tables, and none of them exist in the database, the database returns an error for each missing table. Use the `IF EXISTS` statement to convert the error to a warning. If you execute the `DROP TABLE` statement and only some of the tables exist while other tables are missing, the database drops the existing tables and returns warnings for each missing table.

# ALTER TABLE

## ALTER TABLE RENAME

`ALTER TABLE RENAME` renames an existing table.

### Required Privileges

To rename a table, you must have the `ALTER TABLE` privilege for the table.

The Ocient System requires these privileges if this statement includes a change to the schema:

- `VIEW` privilege on the current schema of the table
- `VIEW TABLE` and `CREATE TABLE` privileges on the target schema (if the schema already exists)
- `CREATE TABLE` privilege on the database (if the schema does not exist)

### Syntax

```
SQL

ALTER TABLE [ IF EXISTS ] old_table_name RENAME TO new_table_name
```

| Parameter | Type | Description |
| --- | --- | --- |
| `old_table_name` | string | The name of the table to alter. |
| `new_table_name` | string | The new name to replace `old_table_name`. |

### Example

This example renames an existing table in the current database and schema named `us.employees` to `mid_west_employees`.

SQL

```
ALTER TABLE us.employees RENAME TO mid_west_employees;
```

This example renames an existing table in the current database named `us.employees` to `north_america.employees`.

SQL

```
ALTER TABLE us.employees RENAME TO north_america.employees;
```

## ALTER TABLE RENAME COLUMN

`ALTER TABLE RENAME COLUMN` renames an existing column.

To rename a column, you must have the `ALTER TABLE` privilege for the table.

### Syntax

SQL

```
ALTER TABLE [ IF EXISTS ] table_name RENAME COLUMN old_column_name TO new_column_na
```

| Parameter | Type | Description |
| --- | --- | --- |
| `table_name` | string | A unique identifier for the table. |
| `old_column_name` | string | The name of the table column to alter. |

| Parameter | Type | Description |
| --- | --- | --- |
| `new_column_name` | string | The new column name to replace `old_column_name`. |

### Example

This example renames an existing column `name` in the table `employees` in the current database and schema to `first_name`.

SQL

```
ALTER TABLE employees RENAME COLUMN name TO first_name;
```

## ALTER TABLE ADD COLUMN

`ALTER TABLE ADD COLUMN` adds a new column to the table.

To add a column, you must have the `ALTER TABLE` privilege for the table.

New columns must either be nullable or specify a default value.

For a defined list of column parameters, see **Column Definition**. For constraints, see **Column Constraint**.

### Syntax

SQL

```
ALTER TABLE [ IF EXISTS ] table_name ADD COLUMN <column_definition>;

<column_definition> ::=
   column_name [ data_type ] [ <column_constraint> [, ...] ]

<column_constraint> ::=
   TIME KEY BUCKET(bucket_granularity [, bucket_value ] )
   | [ NOT ] NULL
   | DEFAULT literal
   | COMMENT comment
   | COMPRESSION GDC [ (compression_value), EXISTING schema_name ]
   | COMPRESSION [ compression_scheme ]
```

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Parameter | Type | Description |
| --- | --- | --- |
| `table_name` | string | A unique identifier for the table. |

### Examples

This example adds a BIGINT column to the `employees` table in the current database and schema with the default value of `0`.

SQL

```
ALTER TABLE employees ADD COLUMN
    new_column BIGINT
        NOT NULL
        DEFAULT 0;
```

This example adds a column that is nullable.

SQL

```
ALTER TABLE employees ADD COLUMN
    new_column BIGINT
    NULL;
```

## ALTER TABLE ALTER COLUMN COMPRESSION

`ALTER TABLE ALTER COLUMN COMPRESSION` alters an existing column in the table to change its compression scheme.

Supported compression schemes are `COMPRESSION NONE`, `COMPRESSION DYNAMIC`, and `COMPRESSION ZSTD`.

> Altering the compression setting of a column only affects compression for data loaded after you execute the SQL statement.

For details about Ocient-supported compression schemes, see **Table Compression Options**.

### Syntax

SQL

```
ALTER TABLE [ IF EXISTS ] table_name ALTER COLUMN column_name
    SET COMPRESSION [ compression_scheme ];
```

| Parameter | Type | Description |
|---|---|---|
| `table_name` | string | The name of the table containing the column to alter. |
| `column_name` | string | The name of the column to alter. |
| `compression_scheme` | string | Supported values for the compression schemes are:<br>`COMPRESSION NONE` specifies no compression applied.<br>`COMPRESSION DYNAMIC` applies only if the column data is dynamically determined to be compressible.<br>`COMPRESSION ZSTD` applies to VARCHAR columns as well as other data types. For this option only, you can specify these additional parameters:<br>`compression_level` — This value signifies how much compression the data receives. The default value is `0`. The full range of values is from `-7` through `15`. The database uses less memory when this value is lower, whereas more memory when this value is larger. Larger values provide better compression.<br>`dictionary_size` — Dictionary size specified as a positive integer that signifies the size of the shared compression dictionary in bytes. The default value is `32768` (32K). The full range of values is from `4096` (4K) through `1048576` (1MB). This value denotes the amount of memory consumed during segment generation. In general, larger values provide better compression but use more memory. |

## Examples

This example alters the compression scheme for the column `employee_name` in the table `employees` in the current database and schema.

SQL

```
ALTER TABLE employees ALTER COLUMN employee_name
    SET COMPRESSION LZ4;
```

This example alters the compression scheme to Zstandard for the column `employee_name` in the table `employees` in the current database and schema.

SQL

```
ALTER TABLE employees ALTER COLUMN employee_name
    SET COMPRESSION ZSTD
        compression_level=5,
        dictionary_size=32768;
```

## ALTER TABLE ALTER REDUNDANCY

`ALTER TABLE ALTER REDUNDANCY` alters the segment part redundancy for future segments of an existing table.

Note that altering a segment part redundancy setting only affects data loaded after applying the SQL statement.

SQL

```
ALTER TABLE [ IF EXISTS ] table_name ALTER REDUNDANCY segment_part (redundancy_sche
```

| Parameter | Type | Description |
|---|---|---|
| `table_name` | string | The name of the table that you want to alter. |
| `segment_part` | string | Specifies the segment part redundancy of the table. Supported values include: `\{ DATA \| MANIFEST \| INDEX \| PDF \| CDE \| STATS }` These settings are defined as follows: `DATA` : The actual data for the table. `MANIFEST` : Header information stored about the data, which describes how to locate any given cluster of rows within the data. `INDEX` : The index of the data used for quicker lookups and better query performance. `STATS` : Used in the optimizer, the probability density function and combinable distinct estimators used to make better optimizations to query plans. |
| `redundancy_scheme` | string | The redundancy scheme. Supported values include: `\{ COPY \| PARITY }` These settings are defined as follows: `COPY` — The system stores a copy of the bytes throughout the storage cluster to ensure redundancy. This option uses more storage but is faster during rebuilds and node outages. `PARITY` — The system uses the parity encoding specified on the storage cluster, and uses parity bits to ensure |

| Parameter | Type | Description |
| --- | --- | --- |
| | | redundancy for the data. This option uses less storage but is slower during rebuilds and node outages. |

### Example

This example alters the `STATS` part to `COPY` redundancy.

SQL

```
ALTER TABLE employees ALTER REDUNDANCY STATS (COPY);
```

## ALTER TABLE DROP COLUMN

`ALTER TABLE DROP COLUMN` drops an existing column from the table.

You cannot remove the TimeKey column and the clustering key columns from the table.

When you remove a column, the database does not remove or free any actual data.

SQL

```
ALTER TABLE [ IF EXISTS ] table_name DROP COLUMN column_name [ IF EXISTS ]
```

| Parameter | Type | Description |
| --- | --- | --- |
| `table_name` | string | The name of the table to alter. |
| `column_name` | string | The name of the column to drop. |

### Example

This example removes a column named `address` from the table `employees`.

SQL

```
ALTER TABLE employees DROP COLUMN address;
```

## ALTER TABLE STREAMLOADER_PROPERTIES

`ALTER TABLE STREAMLOADER_PROPERTIES` resets the table streamloader properties to the provided string. The properties string must be in valid JSON format.

The database registers streamloader changes dynamically. Therefore, you do not need to restart nodes or take other actions for the changes to take effect.

Any properties not specified in the string default to the system-wide setting.

SQL

```
ALTER TABLE [ IF EXISTS ] table_name STREAMLOADER_PROPERTIES streamloader_json
```

| Parameter | Type | Description |
|---|---|---|
| `table_name` | string | The name of the table to alter. |
| `streamloader_json` | string | The streamloader properties to alter. See this table for a list of all supported properties. |

## Configuring Streamloader Properties

`STREAMLOADER_PROPERTIES` is a field on the table metadata that must be written as a JSON string in order to be read properly. The database can dynamically render any changes to `STREAMLOADER_PROPERTIES` with the `ALTER TABLE` SQL statement. You can set Loader Node properties for a new table as a parameter in the `CREATE TABLE` SQL statement. You do not need to restart the database node for the changes to take effect.

### Per-Table Streamloader Properties

| Parameter | Data type | Description |
|---|---|---|
| `pageQueryExclusionDuration` | An integer in nanoseconds (ns) or a string with the suffix `ns`, `us`, `ms`, or `s` appended.<br><br>For example: `"10s"` = 10 seconds, `"1000us"` = 1,000 microseconds | Per-table configuration for the time interval for pages that should be excluded from queries.<br>The database excludes pages with time column values that are greater than the duration of the query.<br>A value of `0` means the database does not exclude any pages.<br>By default, this value is set to `0` if not specified. |

### Example

This example sets the Loader Node properties of the table `employees` to `{"pageQueryExclusionDuration" : "30s"}`. This means that any pages added less than 30 seconds ago are not included in query results.

SQL

```
ALTER TABLE employees
    STREAMLOADER_PROPERTIES '{
        "pageQueryExclusionDuration" : "30s"
        }';
```

## ALTER TABLE DISABLE INDEX

The `ALTER TABLE DISABLE INDEX` statement instructs future queries not to use the specified indexes, but existing segments and new segments continue to have the index available in case you enable the index again.

All secondary indexes except for secondary clustering key indexes can be disabled. Trying to disable other types of indexes generates an error.

You can specify the index by name or UUID.

### Syntax

SQL

```
ALTER TABLE [ IF EXISTS ] table_name DISABLE INDEX
    { index_name_or_uuid | IN (index_name_or_uuid [,...]) }
```

| Parameter | Type | Description |
|---|---|---|
| `table_name` | string | The name of the table to alter. |
| `index_name_or_uuid` | string | The name or UUID of the index to disable.<br>If you specify the index by name, the name must match an existing index.<br>If you specify a UUID instead, it does not have to match an existing index. Therefore, you can disable a dropped index using its UUID, which ensures it is not used within old segments that were loaded with the index.<br>You can get a list of index names and UUIDs in your |

| Parameter | Type | Description |
| --- | --- | --- |
| | | database by referencing the **sys.indexes** table in the system catalog. |

### Examples

This example disables an existing index named `current_idx` on the table `employees`.

SQL

```
ALTER TABLE employees DISABLE INDEX current_idx;
```

This example disables an existing or dropped index with the UUID `5c15d8de-36fa-4055-9bdc-3f1750aaeea0`.

SQL

```
ALTER TABLE employees DISABLE INDEX '5c15d8de-36fa-4055-9bdc-3f1750aaeea0';
```

This example disables both indexes `current_idx` and `other_idx` on the table `employees`.

SQL

```
ALTER TABLE employees DISABLE INDEX IN (current_idx, other_idx);
```

## ALTER TABLE ENABLE INDEX

The `ALTER TABLE ENABLE INDEX` statement reverts the operation performed by the `ALTER TABLE DISABLE INDEX` statement.

### Syntax

SQL

```
ALTER TABLE [ IF EXISTS ] table_name ENABLE INDEX index_name_or_uuid
```

| Parameter | Type | Description |
| --- | --- | --- |
| `table_name` | string | The name of the table to alter. |
| `index_name_or_uuid` | string | The name or UUID of the index to enable.<br>If you specify the index by name, the name must match an existing index.<br>If you specify a UUID instead, it does not have to match an existing index. Therefore, you can disable a dropped index using its UUID, which ensures it is not used within old segments that were loaded with the index.<br>You can get a list of index names and UUIDs in your database by referencing the **sys.indexes** table in the system catalog. |

### Examples

This example enables an existing index named `current_idx` on the table `employees`.

SQL

```
ALTER TABLE employees ENABLE INDEX current_idx;
```

This example enables an existing or dropped index with the UUID `5c15d8de-36fa-4055-9bdc-3f1750aaeea0`.

SQL

```
ALTER TABLE employees ENABLE INDEX '5c15d8de-36fa-4055-9bdc-3f1750aaeea0';
```

This example enables both indexes `current_idx` and `other_idx` on the table `employees`.

SQL

```
ALTER TABLE employees ENABLE INDEX IN (current_idx, other_idx);
```

## ALTER TABLE ENABLE RETENTION POLICY AGE

This `ALTER TABLE` SQL statement enacts a new retention policy on the specified table. A table can have only one retention policy. For details about retention policies, see **Table**

**Retention Policies**.

### Required Privileges

You must have the `ALTER` and `DELETE` privileges for the specified table.

> ⚠ Enacting a new retention policy on an existing table already loaded with data might cause the system to delete many rows.

### Syntax

SQL

```
ALTER TABLE [ IF EXISTS ] table_name ENABLE RETENTION POLICY AGE
    retention_granularity retention_value
```

| Parameter | Type | Description |
|---|---|---|
| `table_name` | string | The name of the table to alter. |
| `retention_granularity` | numeric | A number that represents the amount of time before the system deletes data in the table. You must pair this number with a specific time type, represented by the `retention_value` parameter.<br><br>For details about setting up retention policies, see **Table Retention Policies**. |
| `retention_value` | string | The unit of time that represents how long the table retains data. Supported values are: `WEEK`, `DAY`, `HOUR`, `MINUTE`, `SECOND`, `MILLISECOND`<br><br>You must pair this number with the amount of time, represented by the `retention_granularity` parameter.<br><br>For example, `1 DAY` schedules the table retention to a granularity of one day. |

### Example

This example creates a new retention policy for `my_table` that deletes any rows older than 1 day.

```sql
ALTER TABLE my_table ENABLE RETENTION POLICY AGE 1 DAY;
```

## ALTER TABLE DISABLE RETENTION POLICY

This `ALTER TABLE` SQL statement disables a retention policy on the specified table. For details about retention policies, see **Table Retention Policies**.

### Required Privileges

You must have the `ALTER TABLE` system privilege and the `ALTER` privilege for the specified table.

### Syntax

```sql
ALTER TABLE [ IF EXISTS ] table_name DISABLE RETENTION POLICY
```

| Parameter | Type | Description |
|---|---|---|
| `table_name` | string | The name of the table to alter. |

### Example

This example removes the retention policy for `my_table`.

```sql
ALTER TABLE my_table DISABLE RETENTION POLICY;
```

## ALTER TABLE SET COMMENT

`ALTER TABLE SET COMMENT` sets or updates the description (comment) of an existing table. Setting an empty string clears the comment.

### Required Privileges

You must have the `ALTER TABLE` privilege for the table.

### Syntax

```
SQL

ALTER TABLE [ IF EXISTS ] table_name SET COMMENT [ = ] 'comment'
```

| Parameter | Type | Description |
|---|---|---|
| `table_name` | string | The name of the table to alter. |
| `comment` | string | The description to set on the table. Use an empty string ( `''` ) to clear an existing comment. |

### Examples

#### Set a Table Description

This example sets the description of the `employees` table.

```
SQL

ALTER TABLE employees SET COMMENT 'Contains all current employee records';
```

#### Set a Table Description Using the Optional Equals Sign

This example uses the optional `=` sign to set the description.

```
SQL

ALTER TABLE employees SET COMMENT = 'Contains all current employee records';
```

#### Clear a Table Description

This example clears the description of the `employees` table.

```sql
ALTER TABLE employees SET COMMENT '';
```

# EXPORT TABLE

`EXPORT TABLE` shows the `CREATE TABLE` statement for an existing table in the current database.

To export a table, you must have the `SELECT TABLE` privilege for the table.

```sql
EXPORT TABLE table_name
```

| Parameter | Type | Description |
|---|---|---|
| `table_name` | string | The name of the table that you want to export. |

### Example

This example exports an existing table in the current database and schema named `trades`.

```sql
EXPORT TABLE trades;
```

Output

SQL

```sql
CREATE TABLE "admin@system"."trade_test" (
    "id" UUID NOT NULL,
    "ticker_symbol" VARCHAR(1048576) COMPRESSION GDC(2) NOT NULL,
    "t_type" VARCHAR(1048576) COMPRESSION GDC(1) NOT NULL,
    "raw_ticker_data" VARCHAR(1048576) COMPRESSION DYNAMIC NULL,
    "created_at" TIMESTAMP TIME KEY BUCKET(1, HOUR) NOT NULL,
    "array_of_tuples" TUPLE<<VARCHAR(1048576) COMPRESSION DYNAMIC,TINYINT,BIGINT,DC
    CLUSTERING INDEX "idx_ticker_symbol_type" ("ticker_symbol", "t_type"),
    INDEX "idx_type" ("t_type")
)
REDUNDANCY cde (PARITY),
REDUNDANCY manifest (COPY),
REDUNDANCY pdf (PARITY),
REDUNDANCY stats (PARITY),
REDUNDANCY column_metadata (COPY),
REDUNDANCY index (PARITY),
REDUNDANCY summary_stats (PARITY),
REDUNDANCY skip_lists (COPY),
REDUNDANCY data (PARITY),
STORAGESPACE "storage",
SEGMENTSIZE 4,
STREAMLOADER_PROPERTIES '{"pageQueryExclusionDuration" : "30s"}';
CREATE INDEX "new_idx" ON "admin@system"."trade_test" ("raw_ticker_data") USING HAS
```

# Views

Manage views in Ocient with SQL DDL, including CREATE VIEW, ALTER VIEW, and DROP VIEW, plus guidance on materialization, security, and query rewrite use cases.

This group of DDL SQL statements allows database administrators to manage views. Database administrators can create, modify, drop, and export views. You can view information about views using the `sys.views` system catalog table.

For information on database components, see the pages on **Databases**, **Schemas**, **Tables**, and **Indexes**.

## CREATE VIEW

`CREATE VIEW` creates a new view in the current database or replaces an existing view. For view creation, the name of the view must be distinct from the name of any existing views in the database.

To create a view, you must have both the `CREATE VIEW` privilege for the current database and the `SELECT` privilege on all directly referenced tables and views in the query.

You must have `DROP` privileges on the view. You also must have `CREATE VIEW` privileges on the database.

### Syntax

SQL

```
CREATE [ OR REPLACE ] VIEW [ IF NOT EXISTS ] view_name AS query
```

| Parameter | Type | Description |
|---|---|---|
| `view_name` | string | A distinct identifier used to name the view. |
| `query` | string | A `SELECT` query that defines the data from a table used to create the view. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

### Example

This example creates an existing view in the current database and schema named `option_trades`.

```
SQL

CREATE VIEW option_trades
    AS SELECT * FROM trades WHERE type = 'OPTIONS';
```

## DROP VIEW

`DROP VIEW` removes one or more existing views in the current database.

To remove a view, you must have the `DROP VIEW` privilege for the view.

### Syntax

```
SQL

DROP VIEW [ IF EXISTS ] view_name [, ...]
```

| Parameter | Type | Description |
|---|---|---|
| `view_name` | string | The identifier of the view to drop.<br>You can drop multiple views by specifying additional view names and separating each with commas. |

### Example

This example drops an existing view in the current database and schema named `star_employees`.

```
SQL

DROP VIEW star_employees;
```

This example drops two views named `star_employees` and `bad_employees`.

SQL

```
DROP VIEW star_employees, bad_employees;
```

# ALTER VIEW RENAME

`ALTER VIEW RENAME` renames an existing view.

### Required Privileges

To rename a view, you must have the `ALTER VIEW` privilege for the view.

The Ocient® System requires these privileges if this statement includes a change to the schema:

- `VIEW` privilege on the current schema of the view
- `VIEW VIEW` and `CREATE VIEW` privileges on the target schema (if the schema already exists)
- `CREATE VIEW` privilege on the database (if the schema does not exist)

### Syntax

SQL

```
ALTER VIEW [ IF EXISTS ] old_view_name RENAME TO new_view_name
```

| Parameter | Type | Description |
|---|---|---|
| `old_view_name` | string | The identifier of the view to rename. |
| `new_view_name` | string | The new name for the specified view. |

### Examples

This example renames an existing view in the current database and schema named `star_employees` to `star_mid_west_employees`.

```sql
ALTER VIEW star_employees RENAME TO star_mid_west_employees;
```

This example renames an existing view in the current database named `us.star_employees` to `us.star_mid_west_employees`.

```sql
ALTER VIEW us.star_employees RENAME TO us.star_mid_west_employees;
```

# ALTER VIEW AS

`ALTER VIEW AS` modifies an inner query of the existing view.

To modify the query for an existing view, you must be a system-level user or have the `ALTER VIEW` privilege for the view. You must also have the `SELECT` privilege on all referenced tables and views in the new query.

### Syntax

```sql
ALTER VIEW [ IF EXISTS ] view_name AS query
```

| Parameter | Type | Description |
|---|---|---|
| `view_name` | string | The identifier for the view to alter. |
| `query` | string | A `SELECT` query that defines the new data from a table used to alter the view. |

### Example

This example alters a view in the current database and schema named `star_employees`.

```sql
ALTER VIEW star_employees AS SELECT * FROM sys.tables;
```

© 2026 Ocient, Inc

# EXPORT VIEW

`EXPORT VIEW` shows the `CREATE VIEW` statement for an existing view in the current database.

To export a view, the logged-in user must be a system-level user or have the `READ VIEW` right for the view.

### Syntax

```
SQL

EXPORT VIEW view_name
```

| Parameter | Type | Description |
|---|---|---|
| `view_name` | string | The identifier for the view to export. |

### Example

This example exports an existing view in the current database and schema named `students`.

```
SQL

EXPORT VIEW students;
```

# Indexes

Manage indexes in Ocient with SQL DDL, including CREATE INDEX and DROP INDEX, plus guidance on cluster keys and secondary index strategies.

This group of DDL SQL statements allows database administrators to manage indexes. Database administrators can create and drop indexes. You can view information about indexes using the `sys.indexes` system catalog table.

For information on other database components, see the pages on **Databases**, **Schemas**, **Tables**, and **Views**.

## CREATE INDEX

`CREATE INDEX` creates a new secondary index.

Indexes help optimize database queries when created on columns that are frequently referenced. For more information on how Ocient® indexes operate, see **Secondary Indexes**.

Creating an index does not trigger re-indexing of existing segments. Only segments generated after the `CREATE INDEX` is issued contain the new index.

Indexes can be created on columns containing various different data types as long as the requirements are met. Please note that depending on the data type, the system can assign different index types by default if you decline to specify which index type to use. The name must be distinct from the name of any existing index on the table.

> You can apply indexes regardless of whether they have GDC compression.

### Syntax

SQL

```
CREATE INDEX [ IF NOT EXISTS ] index_name ON table (column_name) [ USING <index_typ

<index_type> ::=
   INVERTED | HASH | NGRAM [ (n_value) ] | SPATIAL | ZONE_MAP
```

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Parameter | Type | Description |
| --- | --- | --- |
| `index_name` | string | An identifier for the index to create.<br>The name must be distinct from the name of any existing index on the table. |
| `table` | string | The name of the table for the index. |
| `column_name` | string | The name of the column for the index.<br>Identical indexes on the same column are not allowed. A column can only have multiple indexes if they are of different types or parameters. |
| `n_value` | integer | Optional.<br>When used with an NGRAM index, this numeric value specifies the character length of the substrings to be indexed.<br>If unspecified, this value defaults to `3`. |

## Index Types ( `<index_type>` )

Ocient supports four index types alongside the clustering index: `INVERTED`, `HASH`, `NGRAM`, and `SPATIAL`.

An index notionally stores a mapping of a column value to the rows that contain that value, and the index type differentiates the format in which the column values are stored and accessed.

Unless an index type is explicitly specified with a `USING` clause, the data type of a column determines a default index type that the system creates. For information on index type defaults, see **Index Type Requirements and Defaults**.

For container data types (e.g., arrays and tuples), the index stores the internal elements of the container, and is used on predicates that target the internal values. However, a mapping of NULL column values is generally stored for both scalar and container data types, so the index can always be used for `column IS NULL` predicates.

| Index Type | Primary Data Types | Primary Usage Description |
| --- | --- | --- |
| `INVERTED` | Fixed-length numeric columns. | Stores whole column value internally, meaning its storage size is approximately the same as the width of the data type.<br>Supports lookups using strict equality or range comparisons. |

| Index Type | Primary Data Types | Primary Usage Description |
|---|---|---|
| | | For details, see the **INVERTED index** section. |
| `HASH` | Variable-length character columns | Stores a hash of the indexed column value rather than the full value.<br>Primarily used for exact comparisons.<br>For details, see the **HASH index** section. |
| `NGRAM` | Variable-length character columns | Stores substrings equal in size to its `n_value`.<br>Storage requirements can greatly vary depending on column data size, width and cardinality.<br>Supports exact string comparison and filters including `LIKE`, `NOT LIKE`, `SIMILAR TO` and `NOT SIMILAR TO`.<br>For details, see the **NGRAM index** section. |
| `SPATIAL` | Geospatial columns ( `POINT`, `LINESTRING`, `POLYGON` ) | Groups geographic objects for bounding-box filtering.<br>For details, see the **SPATIAL index** section. |
| `ZONE_MAP` | Fixed-length columns<br>(INT, BIGINT, SMALLINT, FLOAT, DOUBLE, BINARY, DECIMAL, HASH, CHAR, IP / IPV4, TIME, TIMESTAMP, DATE, UUID) | Supports range and exact matches on a whole segment level.<br>The system stores the minimum and maximum values for the column per-segment. |

For further description and examples of the index types, see **Secondary Indexes**.

### Examples

This example creates an index named `new_idx` on the `address` column of the table. Because `address` is a `VARCHAR` column, this index defaults to the HASH index type.

SQL

```
CREATE INDEX new_idx ON employees (address);
```

This example creates an index of type NGRAM on the `address` column. As the NGRAM has no specified `n_value`, it defaults to indexing substrings of three characters long.

```sql
CREATE INDEX ngram_address_idx ON employees (address) USING NGRAM;
```

This example creates an index on a component of the `tuple_col` column. As this column is of data type `INT`, the index defaults to using the `INVERTED` type.

```sql
CREATE INDEX tuple_index ON employees (tuple_col[1]);
```

This example creates an index on a component of the `point_col` column. As this column is of data type `POINT`, the index defaults to using the `SPATIAL` type.

```sql
CREATE INDEX spatial_index ON employees (point_col)
```

# DROP INDEX

`DROP INDEX` drops a secondary index on a table.

After an index is dropped, new segments that are generated do not contain the new index. However, no existing segments will be altered. This means that until a segment is rebuilt, you can still use the removed index internally, and the system does not reclaim the storage space the removed index occupied.

### Syntax

```sql
DROP INDEX [ IF EXISTS ] index_name ON table_name
```

| Parameter | Type | Description |
|---|---|---|
| `index_name` | string | An identifier for the index to drop. |
| `table_name` | string | The name of the table with the index to drop. |

### Example

This example drops the index named `new_idx` on the `employees` table.

```sql
DROP INDEX new_idx ON employees;
```

# Data Pipelines

Overview of Ocient data pipelines, the SQL-based ETL framework with CREATE PIPELINE DDL commands for ingesting and transforming streaming and batch data.

Data pipelines enable you to load data from your chosen source into the OcientAIQ™ Unified Data Platform. You can preview a data pipeline using the `PREVIEW PIPELINE` SQL statement to test the creation statement and any required data transformation. Then, you can create a data pipeline using the `CREATE PIPELINE` statement. To manage the load, use the `START PIPELINE` statement to start the load and the `STOP PIPELINE` statement to stop it. Or, you can use the `QUIESCE PIPELINE` statement to stop the execution of the data pipeline gracefully. To evolve the schema of a data pipeline, you can use the `ALTER PIPELINE` statement. You can also rename a data pipeline using the `ALTER PIPELINE RENAME` statement. To see the full definition of a created pipeline, use the `EXPORT PIPELINE` statement. When you finish with the load, you can use the `DROP PIPELINE` statement to remove the data pipeline. You can create user-defined data pipeline functions using the `CREATE PIPELINE FUNCTION` statement and remove the function using the `DROP PIPELINE FUNCTION` statement. To see the full definition of a created pipeline function, use the `EXPORT PIPELINE FUNCTION` statement. Also, you can administer privileges for data pipelines and data pipeline functions. For details, see **Data Control Language (DCL) Statement Reference**.

> As an alternative to writing DDL statements, you can create data pipelines using the **Pipeline Builder** in the Management UI. The Pipeline Builder provides a guided workflow to configure sources, formats, and transformations without writing SQL.

## CREATE PIPELINE

`CREATE PIPELINE` defines a data pipeline that you can execute with the `START PIPELINE` SQL statement. Specify the type of load, data source, and data format. To replace an existing pipeline, specify the `OR REPLACE` keywords. For a comparison with the `ALTER PIPELINE` SQL statement, see **Update a Pipeline**.

You must have the `ALTER` privilege on the pipeline. For details, see **Data Control Language (DCL) Statement Reference**.

## Pipeline Identity and Naming

The name of a data pipeline is unique in an Ocient® System. Reference the pipeline in other SQL statements like `START PIPELINE`, `STOP PIPELINE`, and `DROP PIPELINE` using the name of the pipeline. The SQL statement throws an error if a pipeline with the same name already exists unless you specify the `IF NOT EXISTS` option. You can rename a pipeline with the `ALTER PIPELINE RENAME` SQL statement.

> SQL identifiers, including pipeline names, table names, and column aliases in the `SELECT` clause, are case-insensitive. The Ocient System normalizes unquoted identifiers to lowercase. To preserve the original case of an identifier, enclose it in double quotes. For details, see **Identifiers**.

## Update a Pipeline

You can update an existing pipeline in two ways: with the `OR REPLACE` clause in the `CREATE PIPELINE` SQL statement or with the `ALTER PIPELINE` SQL statement. Both statements require the pipeline to be inactive, which means that it has the `STOPPED`, `QUIESCED`, `COMPLETED`, or `FAILED` status. Both statements keep the name of the pipeline. Otherwise, the statements behave differently.

The `CREATE OR REPLACE PIPELINE` statement replaces the pipeline by dropping the existing pipeline object and creating a new one. The new pipeline has these characteristics:

- A replaced file-based pipeline cannot perform deduplication against data that the original pipeline loaded. A replaced Kafka streaming pipeline starts its loading from the last committed offset.
- The pipeline starts with a fresh state, including target files, raft data, the durability horizon, metrics, and system catalog entries. This state does not include Kafka consumer group offsets, which the Kafka Broker stores.

- The name of the pipeline remains the same. Because the system catalog and metrics entries of the dropped pipeline persist under that name, a query by name can return entries for both the original and the new pipeline identifier. Filter by pipeline identifier to distinguish them.

The `ALTER PIPELINE` statement updates most of the configuration and transformations of an existing pipeline. The statement performs an in-place modification that preserves the existing state of the pipeline. The statement provides these guarantees:

- No change to the pipeline identifier.
- No impact to the durability horizon, which means no data loss or duplication.
- No impact to metrics, except for querying by name after a rename.

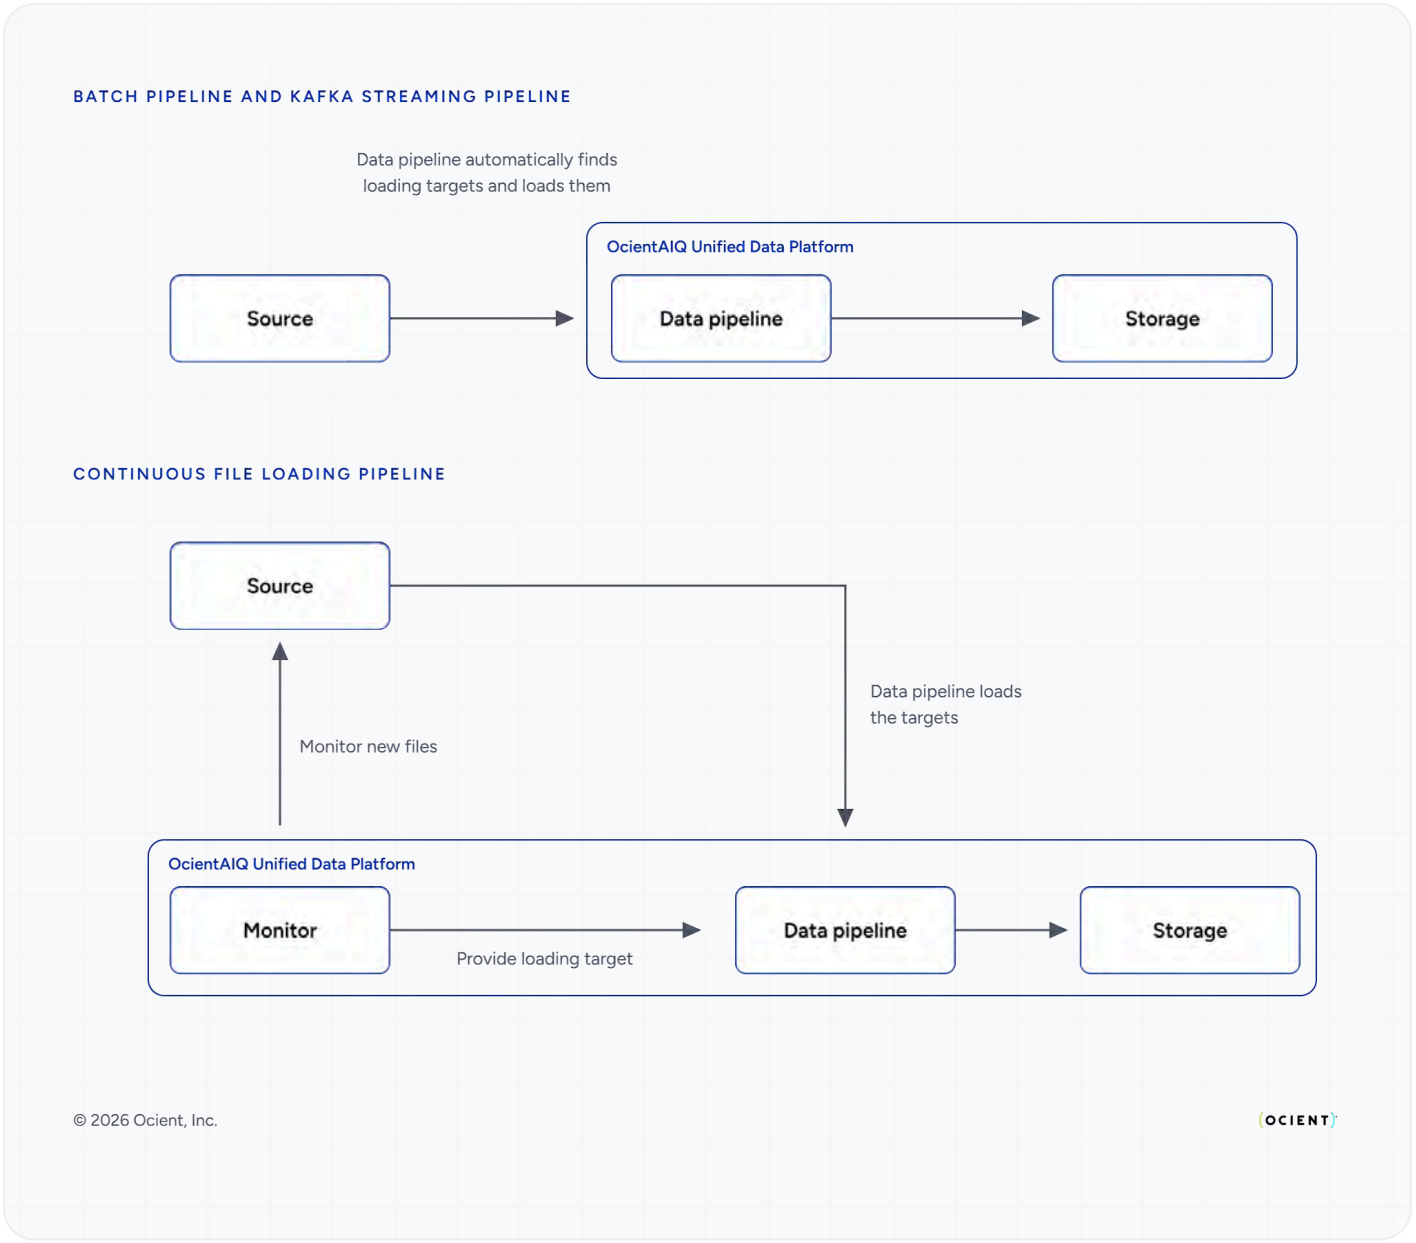
### Where the Load Resumes

The statement that you choose does not by itself determine where the load resumes. The resume point depends on the type of the source.

- For a file source, such as S3, Apache® Hadoop® Distributed File System (HDFS), or a file system, the `ALTER PIPELINE` statement keeps the existing list of files and the position of the load. The `CREATE OR REPLACE PIPELINE` statement builds a new list of files, so the load starts over and reloads files that the original pipeline already loaded.
- For a Kafka source, the resume point depends on the consumer group identifier, not on the statement. If the group identifier does not change, the pipeline resumes from the last offset that it committed to the Kafka Broker. If the group identifier changes, the pipeline starts according to the `auto.offset.reset` policy, which depends on whether the new group previously committed offsets for the topic. For details, see **Kafka Offsets and Consumer Group Identifiers**.

> ⚠ If you do not specify the `GROUP_ID` option, the consumer group identifier of a Kafka pipeline derives from the name of the pipeline. Renaming the pipeline changes that identifier and the resume point of the load. For details, see **ALTER PIPELINE RENAME**.

Use the `ALTER PIPELINE` statement for most updates, such as when you rotate credentials, tune pipeline options, or evolve the schema of the pipeline. Use the `CREATE OR REPLACE PIPELINE` statement when you want a new pipeline object, such as when you want to reset the durability horizon and metrics or restart a file-based load from the beginning. For details, see the **ALTER PIPELINE** SQL statement.



## Data Pipeline Modes

You can define pipelines in either batch `BATCH`, continuous `CONTINUOUS`, or transactional `TRANSACTIONAL` mode.

- File sources (e.g., `s3`, `filesystem`) support `BATCH` and `CONTINUOUS` modes. File-based loads default to `BATCH` mode if you do not specify this keyword.
- Kafka only supports `CONTINUOUS` mode. Loads with a Kafka source default to `CONTINUOUS` mode if you do not specify this keyword.
- When you execute the `START PIPELINE` SQL statement using a data pipeline in the `BATCH` mode, the system creates a static list of files with the `PENDING` status in the `sys.pipeline_files` system catalog table. With the `CONTINUOUS` mode, the monitor appends new incoming files to the list of files in the `sys.pipeline_files` system catalog table.
- With the `CONTINUOUS` mode, you can apply filters for the data pipeline. The system only uses files in the consumed messages if the filenames match the filters. For this mode, these options are invalid:
  - PREFIX
  - SORT_BY
  - SORT_DIRECTION
  - SORT_REWRITE
  - START_CREATED_TIMESTAMP
  - END_CREATED_TIMESTAMP
  - START_MODIFIED_TIMESTAMP
  - END_MODIFIED_TIMESTAMP
- The `TRANSACTIONAL` mode enables the data pipeline to roll back the interim results of the load if an error occurs during load execution. The system makes all data visible only after the load completes successfully. This mode supports all options that the `BATCH` mode does. For details, see **Transactional Data Pipelines**.

This diagram shows the interaction between the source and storage for a batch and continuous pipeline. For a batch pipeline, the data pipeline automatically finds loading targets and loads them. Whereas for a continuous data pipeline, the monitor searches for new files and provides the loading target and the pipeline loads the targets.

Ocient Proprietary and Confidential

## Required Options

You must define certain options in every pipeline. For these options, there is no default value. Optional options need to be present only if you use specific functions. A pipeline must contain the `SOURCE`, `EXTRACT FORMAT`, and `INTO table_name ... SELECT` statements.

- **SOURCE Options**
- **EXTRACT Options**
- **Data Formats for Data Pipelines**
- **Transform Data in Data Pipelines**

These options depend on each other: `IF NOT EXISTS` and `OR REPLACE` SQL statements are mutually exclusive.

## SELECT Statement and Data Transformation

Use the `INTO table_name ... SELECT` SQL statement in the `CREATE PIPELINE` SQL statement to specify how to transform the data. The `SELECT` statement includes a set of one or more expressions and a target column name in the form `expression as column_name`. The `expression` part in the statement contains a source field reference (e.g., `$1` or `$my_field.subfield`) and, optionally, the transformation function you want to apply.

If your data is nested in arrays, you can use special transformation functions, such as the **EXPLODE_OUTER** function, to expand the data into individual rows.

For details about data transformation and supported transformation functions, see **Transform Data in Data Pipelines**.

For details about data types and casting, see **Data Types for Data Pipelines** and **Data Formats for Data Pipelines**.

You can also specify metadata values, such as filename, to load in the `SELECT` SQL statement. For details, see **Load Metadata and File-Based Partitioned Data in Data Pipelines**.

This is an example of a transformation statement snippet.

SQL

```
...
FORMAT json
INTO public.orders
SELECT
    TIMESTAMP(BIGINT($created_timestamp)) as ordertime,
    metadata('filename') as source_filename,
    $order_number as ordernumber,
    $customer.first_name as fname,
    LEFT($customer.middle_initial,1) as minitial,
    $customer.last_name as lname,
    $postal_code as postal_code,
    $promo_code as promo_code,
    $order_total as ordertotal,
    DECIMAL($tax,8,2) as tax,
    CHAR[]($line_items[].product_name) as product_names,
    CHAR[]($line_items[].sku) as skus
```

© 2026 Ocient, Inc

Optionally, you can filter the load by using the `WHERE` clause in the form `WHERE filter_expression`. This expression should evaluate to a Boolean value or NULL and can include more than one filter expression. The system loads rows that contain data matching the filter criteria when the expression evaluates to `true`. The system does not load the rows when the expression evaluates to `false` or NULL. You can include any transform in the `WHERE` clause as in the `SELECT` clause.

This is an example of a filter snippet that loads order data for customers whose last name starts with the letter `a`. Use the `COALESCE` function to return only non-NULL values.

SQL

```
...
FORMAT json
INTO public.orders
SELECT
    TIMESTAMP(BIGINT($created_timestamp)) as ordertime,
    metadata('filename') as source_filename,
    $order_number as ordernumber,
    $customer.first_name as fname,
    LEFT($customer.middle_initial,1) as minitial,
    $customer.last_name as lname,
    $postal_code as postal_code,
    $promo_code as promo_code,
    $order_total as ordertotal,
    DECIMAL($tax,8,2) as tax,
    CHAR[]($line_items[].product_name) as product_names,
    CHAR[]($line_items[].sku) as skus
WHERE
    STARTSWITH(COALESCE($customer.last_name, ''),'a')
```

## NULL and Default Value Handling

The Ocient System has specific ways to handle NULL and default values in the data pipeline. Consider this information when you prepare data to load and write the `CREATE TABLE` and `CREATE PIPELINE` SQL statements.

To load NULL values, insert the NULL value in the data. In this case, if you specify `NOT NULL` for the target column in the `CREATE TABLE` statement, the data pipeline fails to load.

If you omit a column in the `SELECT` SQL statement, the data pipeline loads the default value for the column. If you do not specify the default value, the pipeline loads a NULL value. If you specify `NOT NULL` for the target column, the data pipeline also fails to load.

You can use the `DEFAULT` keyword to load a default value. In this case, if the column does not have a default value, the pipeline fails to load. If the pipeline loads a NULL into a column with a specified default value, you can use `COALESCE(<value>, DEFAULT)` to insert the default value instead of the NULL value, where `<value>` is the NULL column. You can modify the load of one column at a time in this way.

This table describes the data pipeline behavior for NULL or omitted column values.

| Value in the Data Pipeline | Nullable Target Column | Default Value in Target Column | Resulting Data Pipeline Behavior |
|---|---|---|---|
| NULL | No | Value might or might not be set. | The pipeline uses the default value if the default exists and you specify the `COLUMN_DEFAULT_IF_NULL` option.<br>Otherwise, the pipeline fails. |
| NULL | Yes | Value might or might not be set. | The pipeline uses the default value if the default exists and you specify the `COLUMN_DEFAULT_IF_NULL` option.<br>Otherwise, the pipeline uses the NULL value. |
| Omitted column in the `SELECT` SQL statement | NULL value might or might not be set. | Yes | The pipeline uses the default value. |
| Omitted column in the `SELECT` SQL statement | No | No | The pipeline fails. |
| Omitted column in the `SELECT` SQL statement | Yes | No | The pipeline uses the NULL value. |

## Required Privileges

You must have the `CREATE PIPELINE` privilege on the underlying database and the `VIEW` privilege on each table in the pipeline definition to execute the `CREATE PIPELINE` SQL

statement. The table must already exist.

See the `START PIPELINE` SQL statement for the required privileges to execute a pipeline.

For details, see **Data Control Language (DCL) Statement Reference**.

## Examples

### Load JSON Data from Kafka

This example loads JSON data from Kafka using the `CREATE PIPELINE` SQL statement. Use the bootstrap server `192.168.0.1:9092` using the Kafka topic `orders`. Load data into the `public.orders` table. Specify the data to load as these JSON selectors:

- Identifier `$id`
- User identifier `$user_id`
- Product identifier `$product_id`
- Subtotal amount `$subtotal`
- Tax `$tax`
- Total amount `$total`
- Discount amount `$discount`
- Created time `$created_at`
- Quantity `$quantity`

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

SQL

```
CREATE PIPELINE orders_pipeline
    SOURCE KAFKA
        BOOTSTRAP_SERVERS '192.168.0.1:9092'
        TOPIC 'orders'
    EXTRACT
        FORMAT json
INTO public.orders
SELECT
    $id as id,
    $user_id as user_id,
    $product_id as product_id,
    $subtotal as subtotal,
    $tax as tax,
    $total as total,
    $discount as discount,
    $created_at as created_at,
    $quantity as quantity;
```

For a complete tutorial, see **Data Pipeline Load of JSON Data from Kafka**.

### Load Delimited Data from S3

This example loads delimited data in CSV format from Amazon® Web Services℠ (AWS℠) S3. Use the `https://s3.us-east-1.amazonaws.com` endpoint with the `ocient-docs` bucket and path `metabase_samples/csv/orders.csv`. Denote path-style access using the `ENABLE_PATH_STYLE_ACCESS` option set to `true`. Specify one header line with the `NUM_HEADER_LINES` option. Load data into the `public.orders` table. Specify the data to load using the column numbers:

- Idenfier
- User identifier
- Product identifier
- Subtotal amount
- Tax
- Total amount
- Discount amount

- Created time
- Quantity

SQL

```
CREATE PIPELINE orders_pipeline
    SOURCE S3
        ENDPOINT 'https://s3.us-east-1.amazonaws.com'
        BUCKET 'ocient-docs'
        FILTER 'metabase_samples/csv/orders.csv'
        ENABLE_PATH_STYLE_ACCESS true
    EXTRACT
        FORMAT csv
        NUM_HEADER_LINES 1
INTO public.orders
SELECT
    $1 as id,
    $2 as user_id,
    $3 as product_id,
    $4 as subtotal,
    $5 as tax,
    $6 as total,
    $7 as discount,
    $8 as created_at,
    $9 as quantity;
```

For a complete tutorial, see **Data Pipeline Load of CSV Data from S3**.

### Continuous File Load of Delimited Data in CSV Files

Create a data pipeline that uses continuous file loading with delimited data in CSV files. Specify to use 32 partitions and 16 cores with the `PARTITIONS` and `CORES` options, respectively. The source is S3 with the `http://endpoint.ocient.com` endpoint and `cs_data` bucket. Specify the filter `'*.csv'` to find all files with a filename that matches a glob pattern without subdirectories, for example, `data.csv`. The system filters filenames with subdirectories such as `data/data_sample.csv`.

For continuous file loading, specify the `MONITOR` option to use the Kafka monitor. Specify the `test-broker:9092` bootstrap server, `cfl_kafka_ten_adtech_flat_small` Kafka topic, and reset the offset to the smallest offset using the `earliest` value of the

`AUTO_OFFSET_RESET` option. Set the client group identifier to `84079bf1-bdc4-4b10-ba12-41ba6b17dffe`.

The format is `csv` with the record delimiter as the newline character `\n`. Load data in the `public.ad_sessions` table.

The `SELECT` statement identifies the columns to load by number. There are 39 fields in the CSV data. For each column, transform each column using cast functions. For details, see **Scalar Data Conversion Functions** for each function. See **Date and Time Functions** for the `TO_TIMESTAMP` function.

SQL

```
CREATE CONTINUOUS PIPELINE test_continuous_pipeline
    PARTITIONS 32
    CORES 16
    SOURCE S3
        ENDPOINT 'http://endpoint.ocient.com/'
        BUCKET 'cs_data'
        FILTER '*.csv'
        MONITOR kafka
            BOOTSTRAP_SERVERS 'test-broker:9092'
            TOPIC 'cfl_kafka_ten_adtech_flat_small'
            AUTO_OFFSET_RESET 'earliest'
            GROUP_ID '84079bf1-bdc4-4b10-ba12-41ba6b17dffe'
    EXTRACT
        FORMAT csv
        RECORD_DELIMITER '\n'
    INTO public.ad_sessions
SELECT
    TO_TIMESTAMP(CHAR($1), 'yyyy-MM-dd HH:mm:ss.SSSSSS', 'java') AS event_date_time
    CHAR($2)                    AS device_model,
    TINYINT($8)                 AS device_user_age,
    BOOLEAN($10)                AS device_ad_tracking_disabled,
    BINARY($11)                 AS device_mac,
    INT($14)                    AS ip_zip,
    FLOAT($19)                  AS ip_zip_latitude,
    DOUBLE($20)                 AS ip_zip_longitude,
    BIGINT($21)                 AS session_id,
    SMALLINT($32)               AS session_response_latency,
    DECIMAL($34, 10, 1)         AS session_transaction_revenue,
    CHAR($39)                   AS session_app_name
;
```

### Continuous File Load of CSV Files with a Unique Message Format

Create a data pipeline that uses continuous file loading when the Kafka monitor consumes messages that do not use the default message format. By default, the monitor expects each message to match the structure of an `s3:ObjectCreated:*` event. When your messages use a different structure, specify the `MESSAGE` syntax to map a JSON selector to the filename, the last modification timestamp, and the file size of each incoming file. For details about the event structure, see **S3 Notification Content Structure**.

In this example, the monitor consumes messages in this JSON format.

JSON

```
{"filename": "/tmp/pipelines/temp.csv", "timestamp": "2025-10-15T12:00:00Z", "size"
```

Specify to use 32 partitions and 16 cores with the `PARTITIONS` and `CORES` options, respectively. The source is S3 with the `http://endpoint.ocient.com/` endpoint and `cs_data` bucket. Specify the filter `'adtech_flat/small/1576515918-0000049496*'` to load only the files in the `adtech_flat/small` directory with a filename that begins with `1576515918-0000049496`.

For continuous file loading, specify the `MONITOR` option to use the Kafka monitor with these options:

- `BOOTSTRAP_SERVERS` — The three Kafka brokers `test-broker1:9092`, `test-broker2:9092`, and `test-broker3:9092`.
- `TOPIC` — The `cfl_kafka` Kafka topic.
- `AUTO_OFFSET_RESET` — The `earliest` value, which resets the offset to the smallest offset.
- `POLLING_INTERVAL` — The interval of 10 seconds at which the monitor consumes the event topic.
- `BATCH` — A maximum of 10 pending files, a wait of 15 seconds before the system starts a batch, and a lookback period of 10 hours for file deduplication.
- `CONSUMER` — A maximum of 10 messages for each poll and an operation timeout of 1000 milliseconds.
- `MESSAGE` — The `$filename`, `$timestamp`, and `$size` JSON selectors that match the fields in the incoming message.
- `GROUP_ID` — The client group identifier `ci__5aaa443e618a`.

For details about these options, see **Continuous File Loading Source Options**.

The format is `csv`. Load data in the `public.ad_sessions` table.

The `SELECT` statement identifies the columns to load by number. For each column, transform each column using cast functions. The `NULL_IF` function loads a NULL value when the source field contains an empty string. For details, see **Scalar Data**

**Conversion Functions** for each cast function. See **Date and Time Functions** for the `TO_TIMESTAMP` function and **Other Functions and Expressions** for the `NULL_IF` function.

SQL

```
CREATE CONTINUOUS PIPELINE kafka_message_pipeline
    PARTITIONS 32
    CORES 16
    SOURCE S3
        BUCKET 'cs_data'
        ENDPOINT 'http://endpoint.ocient.com/'
        FILTER 'adtech_flat/small/1576515918-0000049496*'
        MONITOR kafka
            BOOTSTRAP_SERVERS 'test-broker1:9092,test-broker2:9092,test-broker3:909
            TOPIC 'cfl_kafka'
            AUTO_OFFSET_RESET 'earliest'
            POLLING_INTERVAL 10 seconds
            BATCH { MAX_FILES 10 TIMEOUT 15 seconds LOOKBACK 10 hours }
            CONSUMER { MAX_MESSAGES 10 TIMEOUT 1000 }
            MESSAGE {
                FILENAME $filename
                TIMESTAMP $timestamp
                SIZE $size
            }
            GROUP_ID 'ci__5aaa443e618a'
    EXTRACT
        FORMAT csv
    INTO public.ad_sessions
SELECT
    TO_TIMESTAMP(CHAR($1), 'yyyy-MM-dd HH:mm:ss.SSSSSS', 'java') AS event_date_time
    CHAR(NULL_IF($2, ''))       AS device_model,
    TINYINT($8)                 AS device_user_age,
    BOOLEAN($10)                AS device_ad_tracking_disabled,
    NULL_IF($11, '')            AS device_mac,
    INT($14)                    AS ip_zip,
    FLOAT($19)                  AS ip_zip_latitude,
    DOUBLE($20)                 AS ip_zip_longitude,
    BIGINT($21)                 AS session_id,
    SMALLINT($32)               AS session_response_latency,
    DECIMAL($34, 10, 1)         AS session_transaction_revenue,
    CHAR($39)                   AS session_app_name
;
```

© 2026 Ocient, Inc

### Transactional Load of Delimited Data in CSV Files

Create a data pipeline that uses transactional file loading with delimited data in CSV files. The source is S3 with the `http://endpoint.ocient.com` endpoint and `cs_data` bucket. Specify the filter `'*.csv'` to find all files with a filename that matches a glob pattern without subdirectories, for example, `data.csv`. The system filters filenames with subdirectories such as `data/data_sample.csv`.

The format is `csv`. Load data in the `public.ad_sessions` table.

The `SELECT` statement identifies the columns to load by number. For each column, transform each column using cast functions. For details, see **Scalar Data Conversion Functions** for each function. See **Date and Time Functions** for the `TO_TIMESTAMP` function.

SQL

```
CREATE TRANSACTIONAL PIPELINE test_continuous_pipeline
    SOURCE S3
        ENDPOINT 'http://endpoint.ocient.com/'
        BUCKET 'cs_data'
        FILTER '*.csv'
    EXTRACT
        FORMAT csv
    INTO public.ad_sessions
SELECT
    TO_TIMESTAMP(CHAR($1), 'yyyy-MM-dd HH:mm:ss.SSSSSS', 'java') AS event_date_time
    CHAR($2)                    AS device_model,
    TINYINT($8)                 AS device_user_age,
    BOOLEAN($10)                AS device_ad_tracking_disabled,
    BINARY($11)                 AS device_mac,
    INT($14)                    AS ip_zip,
    FLOAT($19)                  AS ip_zip_latitude,
    DOUBLE($20)                 AS ip_zip_longitude,
    BIGINT($21)                 AS session_id,
    SMALLINT($32)               AS session_response_latency,
    DECIMAL($34, 10, 1)         AS session_transaction_revenue,
    CHAR($39)                   AS session_app_name
;
```

### S3 Credentials Hierarchy

The S3 source configuration supports this hierarchy to obtain S3 credentials:

- Level 1: Data pipeline configuration (set by using the `ACCESS_KEY_ID` and `SECRET_ACCESS_KEY` options)
- Level 2: **AWS SDK Default Credential Provider Chain** (set by using the instructions provided in the web page)
- Level 3: Anonymous access (set by default)

If the Ocient System does not obtain the credentials at a level, the system tries a lower level.

You can choose the level to store the credentials, where Level 1 is the highest. Higher levels take precedence for credential storage.

### FILESYSTEM Source Options

No options exist specific to the file system source ( `SOURCE FILESYSTEM` ) except for general **file-based source options**.

Files must be located in these directories:

- Always allowed:
  - `/tmp`
  - `config streamloader.extractorEngineParameters.tempDir` (default is `/var/opt/ocient/tmp` )
  - `config streamloader.extractorEngineParameters.configurationOption.filesystem.access.directories`
    - The default is empty.
    - You can specify a list of directories.
- Not allowed:
  - `/etc`
  - `/bin`
  - `/sbin`
  - `/lib`
  - `/lib64`
  - `/usr`
  - `/boot`
  - `/proc`
  - `/sys`
  - `/run`
  - `/root`
  - `/var/lib`

- `/var/log`
- `/var/run`
- `/var/cache`

> When you load data using `SOURCE FILESYSTEM`, the files must be addressable from all of your Loader Nodes. The Ocient System uses the specified path in the pipeline PREFIX and FILTER options to select the files to load.
>
> A shared view of the files you want to load must be available to all Loader Nodes involved in a pipeline. For example, you can use a Network File System (NFS) mount available to all Loader Nodes at a common path on each node.

### Example

This example `CREATE PIPELINE` SQL statement snippet contains a `FILESYSTEM` source and filters to all CSV files in the `/tmp/sample-data/` directory on each of the Loader Nodes.

SQL

```
CREATE PIPELINE ...
    SOURCE FILESYSTEM
        PREFIX '/tmp/sample-data/'
        FILTER '**/*.csv'
    EXTRACT
        FORMAT delimited
INTO public.orders
SELECT
    $1 as username,
    $2 as subtotal,
    ...
```

## HDFS Source Options

You can specify these options for HDFS data sources ( `SOURCE HDFS` ).

HDFS sources support the same file formats as `FILESYSTEM` and `S3` sources, including `delimited`, `csv`, `json`, `binary`, `asn.1`, `avro`, `parquet`, and `xml`.

For advanced options, see **Data Pipeline Load of JSON Data from HDFS**.

The HDFS source also supports Kerberos authentication using a keytab file or a delegation token. For details, see **Kerberos Authentication for HDFS Sources**. For examples, see “Load Data from HDFS with Kerberos Keytab Authentication” and “Load Data from HDFS with Kerberos Delegation Token Authentication” below.

| Option Key | Default | Data Type | Option Configurability | Description |
|---|---|---|---|---|
| ENDPOINT | None | STRING | No | Required.<br><br>The hostname ar port number of t namenode serve For example, `'m hdfs-server:1234'`.<br><br>The namenode server manages file system and regulates access data. |
| CONFIG | None | JSON-formatted STRING | Yes | Optional.<br><br>The JSON string that contains HDFS **configuration properties** to use during the load. The proper are primarily for authentication. Y can also use thes properties to configure advanc properties such a connection timeouts, parallelism, and network chunk sizes.<br><br>**Example:** `CONFIG '{"dfs.client.u datanode.hostna : true, "dfs.client.soc` |

| Option Key | Default | Data Type | Option Configurability | Description |
|---|---|---|---|---|
| | | | | `-timeout": 300000}'` |
| KEYTAB_FILE | None | STRING | Yes | Optional.<br><br>The file path to t keytab file that stores one or mc Kerberos princip and their encryp keys. The file mu exist at the specified path or Loader Nodes.<br><br>Use this option f keytab file authentication. I you specify eithe the `PRINCIPAL` `KEYTAB_FILE` option, you must specify both. You cannot specify th option with the `TOKEN` or `TOKEN_FILE` opt |
| PRINCIPAL | None | STRING | Yes | Optional.<br><br>The unique user identity within a Kerberos realm, such as `'loaduser@EXAMP COM'`.<br><br>Use this option f keytab file authentication. I you specify eithe the `PRINCIPAL` `KEYTAB_FILE` option, you must specify both. You cannot specify th option with the `TOKEN` or `TOKEN_FILE` opt |

| Option Key | Default | Data Type | Option Configurability | Description |
|---|---|---|---|---|
| RENEW_INTERVAL | 10 MINUTES | TIME INTERVAL | Yes | Optional.<br><br>The frequency at which the loadin process renews t delegation token<br><br>You can specify t option only wher you specify the `TOKEN` or `TOKEN_FILE` opt<br><br>**Value Range:** 5 seconds to 24 hours. |
| TOKEN | None | STRING | Yes | Optional.<br><br>The delegation token as a URL-formatted string.<br><br>Use this option f delegation token authentication. Y can specify only one of the `TOKEN` and `TOKEN_FILE` options. You can specify this optic with the `PRINCIPAL` or `KEYTAB_FILE` option. |
| TOKEN_FILE | None | STRING | Yes | Optional.<br><br>The file path to t delegation token storage file. The must exist at the specified path or Loader Nodes. Tl system checks tl the file exists wh you create the d pipeline.<br><br>Use this option f |

| Option Key | Default | Data Type | Option Configurability | Description |
|---|---|---|---|---|
| | | | | delegation token authentication. Y can specify only one of the `TOKEN` and `TOKEN_FILE` options. You can specify this optic with the `PRINCIPAL` or `KEYTAB_FILE` option. |

### Examples

These examples show different ways to use Kerberos authentication for loading HDFS source data.

#### Load Data from HDFS with Kerberos Keytab Authentication

This example loads GZIP-compressed CSV files from an HDFS source that requires Kerberos authentication with a keytab file. The pipeline uses the `hdfs-host:9000` endpoint and filters on the path `/data/scores/2026/*.csv.gz`. Configure Kerberos authentication by specifying these options:

- The `PRINCIPAL` option with the Kerberos principal `loaduser@EXAMPLE.COM`.
- The `KEYTAB_FILE` option with the path of a keytab file that exists on all Loader Nodes.
- The `CONFIG` option with the `dfs.namenode.kerberos.principal` and `dfs.data.transfer.protection` configuration properties so that the loading process can identify the Kerberos principal of the namenode server.

Load the data into the `public.student_scores` table. The `SELECT` statement identifies the columns to load by number. For details about Kerberos authentication, see **Kerberos Authentication for HDFS Sources**.

SQL

```
CREATE PIPELINE student_scores_keytab_pipeline
    SOURCE HDFS
        ENDPOINT 'hdfs-host:9000'
        FILTER '/data/scores/2026/*.csv.gz'
        PRINCIPAL 'loaduser@EXAMPLE.COM'
        KEYTAB_FILE '/etc/security/keytabs/loaduser.keytab'
        CONFIG '{"dfs.data.transfer.protection": "authentication", "dfs.namenode.ke
        COMPRESSION_METHOD 'gzip'
    EXTRACT
        FORMAT csv
    INTO public.student_scores
SELECT
    $1 AS id,
    $2 AS name,
    $3 AS score,
    $4 AS active;
```

### Load Data from HDFS with Kerberos Delegation Token Authentication

This example loads the same GZIP-compressed CSV files as the previous example with delegation token authentication instead of a keytab file. Specify the `TOKEN` option with the delegation token string. The loading process renews the token every five minutes as specified by the `RENEW_INTERVAL` option. For details about Kerberos authentication, see **Kerberos Authentication for HDFS Sources**.

SQL

```
CREATE PIPELINE student_scores_token_pipeline
    SOURCE HDFS
        ENDPOINT 'hdfs-host:9000'
        FILTER '/data/scores/2026/*.csv.gz'
        TOKEN 'HAAHbG9hZHVzZXItdG9rZW4tc3RyaW5n'
        RENEW_INTERVAL 5 MINUTES
        COMPRESSION_METHOD 'gzip'
    EXTRACT
        FORMAT csv
    INTO public.student_scores
SELECT
    $1 AS id,
    $2 AS name,
    $3 AS score,
    $4 AS active;
```

## KAFKA Source Options

You can apply these options to Kafka data sources ( `SOURCE KAFKA` ).

> For compression, you do not need to specify a compression option in Kafka streaming pipelines, because the Ocient System handles the compression type automatically. Records produced to the Kafka broker with a `compression.type` setting or with the `compression.type` set on the topic automatically decompress when the loading process consumes the records. The loading process uses built-in headers in Kafka to determine the required decompression during extraction.

| Option Key | Default | Data Type | Option Configurability | Description |
|---|---|---|---|---|
| BOOTSTRAP_SERVERS | None | STRING | No | A comma-delin list of `IP:port` pairs that cont the IP addresse and the associ port numbers Kafka Brokers. can also use a hostname inst of the IP addre **Example:** `BOOTSTRAP_SER =` |

| Option Key | Default | Data Type | Option Configurability | Description |
|---|---|---|---|---|
| | | | | `'198.51.100.1 ,198.51.100.2 '` |
| TOPIC | None | STRING | No | The name of th Kafka topic indicates wher consume recor |
| WRITE_OFFSETS | `true` | BOOLEAN | Yes | Optional.<br><br>Indicates whet the Kafka cons should write its durably-made record offsets t Kafka Broker. |
| CONFIG | `'{ "group.id": "<systemId>__<dataBaseName>__<pipelineName>" }'` | JSON-formatted STRING | Yes | Optional.<br><br>The **consume configuration** the Kafka consumers sho use.<br><br>Frequently spe configurations include `group.` and `security.prot` .<br><br>These configurations fixed and cann overridden: `{ "enable.auto.commit": false, "key.deserializer": "org.apache.kafka.common.serialization.ByteArrayDeserializer", "value.deserializer": "org.apache.kafka.common.serialization.ByteArrayD` |

| Option Key | Default | Data Type | Option Configurability | Description |
|---|---|---|---|---|
| | | | | `alizer" }` |
| AUTO_OFFSET_RESET | `'latest'` | STRING | Yes | Optional.<br><br>Determine whi action to take f the Kafka configuration v there is no initi offset in the of store or the specified offset out of range.<br><br>Supported valu are:<br><br>`'earliest'` — Automatically r the offset valu the smallest va<br><br>`'latest'` — Automatically r the offset valu the largest valu |
| GROUP_ID | `'<systemId>__<dat abaseName>__<pipe lineName>'` | STRING | No | Optional.<br><br>Client group identifier for th Kafka source configuration. |

For the consumer configuration, to create a secure connection from the Kafka consumer to a Kafka Broker, set the `"security.protocol"` key along with any SSL or SASL keys.

If a certificate file is required, you must add it to the truststore used by the JVM® on all Loader Nodes. The truststore path must be identical on all Loader Nodes. The Kafka configuration can reference this truststore path.

© 2026 Ocient, Inc

If you specify the `ssl.certificate.location` or `ssl.ca.location` consumer configuration, you must specify both of these configurations. Otherwise, the system throws an error. For example: `CONFIG '{"auto.offset.reset": "earliest","ssl.certificate.location":"/etc/blab/file1.txt","ssl.ca.location":"/etc/blab/file2.txt"}'`

## Continuous File Loading Source Options

Specify these options for data pipelines that use `FILESYSTEM` or `S3` sources with the `CONTINUOUS` mode. For a Kafka source, do not use these options.

You are responsible for setting up, maintaining, and publishing messages to the external tooling (e.g., Kafka, Amazon® SQS). The data pipeline does not generate messages automatically.

### General File Monitor Options

| Option Key | Default | Data Type | Option Configurability | Description |
|---|---|---|---|---|
| MONITOR | None | STRING | No | The type of monitor. Valid values are: `sqs` `kafka`. |
| POLLING_INTERVAL | 10 SECONDS | TIME INTERVAL | Yes | Optional.<br><br>Unit of time to consume the eve topic.<br><br>**Value Range:** 1 seconds to 2 minutes. |
| MAX_FILES | 100 | INTEGER | Yes | Optional.<br><br>In the `BATCH` syntax, the maximum numb of pending files t collect before starting a batch.<br><br>**Value Range:** 1 2,000. |

| Option Key | Default | Data Type | Option Configurability | Description |
|---|---|---|---|---|
| TIMEOUT | 1 MINUTE | TIME INTERVAL | Yes | Optional.<br><br>In the `BATCH` syntax, the time wait before start a batch.<br><br>**Value Range:** 1 seconds to 30 minutes. |
| LOOKBACK | 1 DAY | TIME INTERVAL | Yes | Optional.<br><br>In the `BATCH` syntax, the unit time to look bacl for file deduplication.<br><br>**Value Range:** 0 milliseconds to 2 days. |

### SQS Monitor Options

Use these options when you use `MONITOR sqs` for SQS.

| Option Key | Default | Data Type | Option Configurability | Description |
|---|---|---|---|---|
| QUEUE_URL | None | STRING | Yes | The URL of the target queue. F example: `http://localhc 2769/000000000 queue1` |
| REGION | `NULL` | STRING | Yes | Optional.<br><br>The region for t SQS operation f signing request<br><br>When unspecifi the region is inferred from `QUEUE_URL` by |

| Option Key | Default | Data Type | Option Configurability | Description |
| --- | --- | --- | --- | --- |
| | | | | looking for `sqs.REGION` or `sqs-fips.REGIC` If the region ca be inferred, it defaults to `us-east-1`. |
| ENDPOINT | `NULL` | STRING | Yes | Optional.<br><br>The endpoint U for the client. F example: `http://localhc 2769`<br><br>When unspecifi defaults to `https://sqs[-fips].REGION.a naws.com` if `REGION` was inferred or specified. Otherwise, this option is requir |
| ACCESS_KEY_ID | `''` | STRING | Yes | Optional.<br><br>Access key identifier for SQ authentication.<br><br>If you specify th option, you mu also specify the `SECRET_ACCESS_` option. The Oci System uses anonymous credentials whe you specify an empty value fo option. |
| SECRET_ACCESS_KEY | `''` | STRING | Yes | Optional.<br><br>The secret acce key for SQS authentication. |

### Kafka Monitor Options

Use these options when you use `MONITOR kafka` for Kafka.

| Option Key | Default | Data Type | Option Configurability | Description |
|---|---|---|---|---|
| BOOTSTRAP_SERVERS | None | STRING | Yes | The bootstrap servers for the Kafka consume configuration. string contains of brokers as a comma-separa list of the brok hostnames or broker hostnar and port numb combinations, the format `hostname:port` |
| TOPIC | None | STRING | Yes | The name of th Kafka topic indicates wher consume recor |
| AUTO_OFFSET_RESET | `'latest'` | STRING | Yes | Optional.<br><br>Action to take the Kafka configuration v there is no initi offset in the of store or the ch offset is out of range:<br>`'earliest'` — Automatically the offset to th smallest offset<br>`'latest'` — Automatically the offset to th largest offset. |

| Option Key | Default | Data Type | Option Configurability | Description |
|---|---|---|---|---|
| GROUP_ID | `'<systemId>__<dat abaseName>__<pipe lineName>_monitor '` | STRING | Yes | Optional.<br><br>Client group identifier for th Kafka configur |
| CONFIG | `'{ "enable.auto.comm it": false, "group.id": " <systemId>__<data baseName>__<pipel ineName>_monitor" , "max.poll.interva l.ms": "600000", "heartbeat.interv al.ms": "6000", "session.timeout. ms": "600000" }'` | JSON-formatted STRING | Yes | Optional.<br><br>The **consume configuration** the Kafka consumers sho use. This optio JSON-formatte string.<br>Certain values within this configuration a fixed, whereas Ocient System provides other values with a default value t you can modif |
| MAX_MESSAGES | 100 | INTEGER | Yes | Optional.<br><br>In the `CONSUME` syntax, the maximum num of messages to each time.<br><br>**Value Range:** 999. |
| TIMEOUT | 1000 MILLISECONDS | TIME INTERVAL | Yes | Optional.<br><br>In the `CONSUME` syntax, the operation time that controls h long the consu request waits f the response.<br><br>**Value Range:** milliseconds to hour. |

| Option Key | Default | Data Type | Option Configurability | Description |
|---|---|---|---|---|
| FILENAME | `$"Records"[1].s3.object.key` corresponds to a `s3:ObjectCreated:Put` event. | SELECTOR | Yes | Optional.<br><br>In the `MESSAGE` syntax, defines JSON selector f the filename o incoming mess in a monitor. Tl default value w for `s3:ObjectCrea*` events. If y override this d configuration, can parse cust JSON message The format mu still adhere to standards. For details, see **Amazon Simp Storage Serv Event messa structure**. The message must the JSON forma you specify thi option, then yo must specify th other two optic the `MESSAGE` syntax. |
| TIMESTAMP | `$"Records"[1]."eventTime"` corresponds to a `s3:ObjectCreated:Put` event. | SELECTOR | Yes | Optional.<br><br>In the `MESSAGE` syntax, defines JSON selector f the last modification timestamp of t file of an incom message in a monitor. The default value w for `s3:ObjectCrea*` events. If y override this d configuration, |

| Option Key | Default | Data Type | Option Configurability | Description |
| --- | --- | --- | --- | --- |
| | | | | can parse cust JSON message The format mu still adhere to standards. For details, see **Amazon Simp Storage Serv Event messa structure**. The message must the JSON forma you specify thi option, then yo must specify th other two optio the `MESSAGE` syntax. |
| SIZE | `$"Records" [1].s3.object.siz e` corresponds to a `s3:ObjectCreated: Put` event. | SELECTOR | Yes | Optional.<br><br>In the `MESSAGE` syntax, defines JSON selector f the file size of incoming mess in a monitor. Th default value w for `s3:ObjectCrea *` events. If y override this d configuration, can parse cust JSON message The format mu still adhere to standards. For details, see **Amazon Simp Storage Serv Event messa structure**. The message must the JSON forma you specify thi option, then yo must specify th other two optio |

| Option Key | Default | Data Type | Option Configurability | Description |
|---|---|---|---|---|
| | | | | the `MESSAGE` syntax. |

> The same Kafka `CONFIG` option override considerations apply. For details, see **KAFKA Source Options**.

## LOOKUP Options

You can optionally look up data in a table from an external database. You can include this table in the `SELECT` statement of the `CREATE PIPELINE` SQL statement and perform join operations on its columns. To use the `LOOKUP` keyword, specify the external source name `lookup_source`.

You can look up data in multiple external databases. In this case, use the `LOOKUP` keyword with the source name and corresponding options for each database.

You must provide the appropriate JDBC JAR file for the JDBC connection to external databases. For tables in the Ocient System, this JAR file is not needed.

> The Ocient System executes the JDBC code as trusted code. Only provide trusted JAR files to the loading process. The `streamloader.extractorEngineParameters.configurationOption.engine.external.jdbc.jarRootDirectory` configuration parameter specifies the location of the JAR file. For details, see **Configuration Settings for Data Pipelines**.

| Option Key | Default | Data Type | Option Configurability | Description |
|---|---|---|---|---|
| CONNECTION_TYPE | None | STRING | Yes | The type of connection. On `'jdbc'` is supported. |
| CONNECTION_STRING | None | STRING | Yes | The string for connection to t external datab For example: `'jdbc:sqlite:/to/file'` |
| LOOKUP_SCHEMA | None | STRING | Yes | The schema of table in the |

| Option Key | Default | Data Type | Option Configurability | Description |
|---|---|---|---|---|
| | | | | external datab |
| LOOKUP_TABLE | None | STRING | Yes | The name of th table in the external datab |
| REFRESH_PERIOD | 30 SECONDS | TIME INTERVAL | Yes | Optional.<br><br>The time betwe lookup cache refreshes.<br><br>**Value Range:** second to 12 h |
| CONFIG | `NULL` | JSON-formatted STRING | Yes | Optional.<br><br>The JSON string that contains additional configuration options. For example: `'{"force_refr f_null": fals`<br><br>Supported JSO keys are:<br><br>`force_refresh ull`, specifie a Boolean that defaults to `tr` When you set t value to `true` system trigger lookup cache refresh for eac value missing f the lookup tabl account for a concurrent loa This cache refr can have a noticeable performance impact. As suc you expect tha some values ca result in succes lookups, then s |

| Option Key | Default | Data Type | Option Configurability | Description |

| | | | | this key to the `false` value.<br><br>`load_timeout_ds`, specified long integer wi default value. T option is the timeout, in seconds, for a lookup cache refresh.<br><br>`driver_class` specified as a s with no default value. This opt the fully qualifi JDBC driver cla name. If you sp this option, the system throws error when the system cannot this driver or th driver cannot l into the proces the JAR file for connection is a JDBC 4 file, the system automatically l the driver class Otherwise, you must specify th fully qualified c name (from `Class::getNam` Java®) using th option, such as `'{"driver_cla "org.test.exa Driver"}'`. |

# EXTRACT Options

## General Extract Options

You can specify these options on any of the allowed `FORMAT` types.

| Option Key | Default | Data Type | Option Configurability | Des |
|---|---|---|---|---|
| FORMAT | None | STRING | No | Spec to lo `del` `csv` `jso` `bin` `asn` `avr` `par` `xml` |
| CHARSET_NAME | Binary format: `ibm1047` All other formats: `utf-8` | STRING | No | Opti Spec dec reco this load colu `CHA` func Defa form defa You valu data such `ALT` `'sq` `t.b` `'ib` |
| COLUMN_DEFAULT_IF_NULL | `false` | BOOLEAN | Yes | Opti Spec shou valu serie If yo (the NULI If yo the defa |

| Option Key | Default | Data Type | Option Configurability | Des |
|---|---|---|---|---|
| | | | | whe exec on th |

| TRIM_WHITESPACE | `false` | BOOLEAN | Yes | Opti Spec whit and durir whit carri char If the matc spec optic valu you the optic conv only This of st To tr can |

| Option Key | Default | Data Type | Option Configurability | Des |
| --- | --- | --- | --- | --- |
| | | | | func<br>func<br>expr<br>func |
| VALIDATE_CHARACTERS | `false` | BOOLEAN | Yes | Opti<br><br>Spec<br>inval<br>enco<br>extra<br>dete<br>syste<br>for fi<br>erro<br>pipe<br><br>This<br>ASN.<br>bina |
| REPLACE_INVALID_CHARACTERS | `false` | BOOLEAN | Yes | Opti<br><br>Spec<br>inval<br>enco<br>repla<br>`U+F`<br><br>This<br>ASN.<br>form |
| REPLACEMENT_CHARACTER | `&#xFFFD;` | STRING | Yes | Opti<br><br>Spec<br>indic<br>set t<br>REPL<br>optic<br>valu<br>char<br><br>This<br>ASN.<br>form |

For ASN.1, Apache® Avro™, and Parquet extract options, the SCHEMA option is a `MAP` type with a `NULL` default value. This option is optionally specified depending on the format. SCHEMA specifies the syntax of options for schema retrieval.

## ASN.1 Extract Options

You can specify these options for ASN.1 data record extraction ( `FORMAT ASN.1` ).

For details about ASN.1-formatted data, see **Load ASN.1 Data**.

| Option Key | Default | Data Type | Option Configurability | Description |
|---|---|---|---|---|
| URL | None | STRING | Yes | In the `SCHEMA` syntax, specify t URL to the ASN.1 schema file in th `.asn` format. |
| RECORD_TYPE | None | STRING | Yes | In the `SCHEMA` syntax, specify t fully qualified na of the record typ to parse. The na is the root-level ASN.1 type to extract from eac DER-encoded record. (e.g., `Example.Personn ecord` ) |

## Avro Extract Options

You can specify these options for Avro data record extraction. The `SCHEMA` options are all optional for object container files (OCF).

For Kafka streaming pipelines, you must specify a schema configuration that includes either the `URL` option or the `INLINE` option (for manual specification), but not both.

For file-based loads, the system can infer the schema from the file structure, so a schema configuration is not required. However, you can specify the schema configuration with:

- Either the `INLINE` option or the `INFER_FROM` option, but not both of these options

- Neither the `INLINE` nor the `INFER_FROM` options

For details about loading Avro-formatted data, see **Load Avro Data**.

| Option Key | Default | Data Type | Option Configurability | Des |
|---|---|---|---|---|
| URL | None | STRING | Yes | The |
| CONFIG | None | STRING | Yes | The incl acc |
| SUBJECT | `<topic_name>-value`, where `<topic_name>` is the name of the source Kafka topic | STRING | Yes | The sch |
| SCHEMA_REGISTRY_ID_LOCATION | `header_or_value` | STRING | Yes | For the ider Sup<br><br>`'h` tha sch IDe<br>`__` Kaf the ider der star me<br><br>`'v` sys ider star me<br><br>`'n` spe em skip<br><br>**Val**<br>`he`<br>`no` |

| Option Key | Default | Data Type | Option Configurability | Des |
|---|---|---|---|---|
| INLINE | None | STRING | Yes | The sch Spe obj |
| INFER_FROM | `sample_file` | STRING or ARRAY OF STRINGS | Yes | In t hov Sup `'s` file list file vali incl **Exa** `SC` san `SC` [‘in ‘inf } |

## BINARY Extract Options

You can apply these options to binary data record extraction (`FORMAT BINARY`).

For details about BINARY-formatted data, see **Load Binary Data**.

> The general option `CHARSET_NAME` has a different default value for `FORMAT BINARY`.

| Option Key | Default | Data Type | Option Configurability | Description |
|---|---|---|---|---|
| RECORD_LENGTH | None | INTEGER | Yes | Specifies the fi size in bytes o each record in source data. Th Ocient System splits the binar data into binar chunks accord this length val and processes individually. |

| Option Key | Default | Data Type | Option Configurability | Description |
|---|---|---|---|---|
| ENDIANNESS | `big` | STRING | Yes | Optional.<br><br>Specifies the endianness us interpret multi sequences in various transfo of binary data.<br><br>**Value Range:** `big` or `littl` |
| AUTO_TRIM_PADDING | `true` | BOOL | Yes | Optional.<br><br>Determines if padding chara should be trim after decoding binary data int string data. If y set this option `TRUE`, the Oci System trims a instances of th `PADDING_CHARA` value from the of a string afte system decode string from `BI` type. |
| PADDING_CHARACTER | (space) | STRING | Yes | Optional.<br><br>The padding character from string after the system decode string from `BI` type.<br>You can chang default paddin character for `BINARY` forma data using a S statement suc `ALTER SYSTEM` `CONFIG SET` `'sql.pipeline` `eters.extract` `ryFormat.defa` |

| Option Key | Default | Data Type | Option Configurability | Description |
|---|---|---|---|---|
| | | | | `ddingCharacte` `'*'` |

> The Ocient System trims the default padding character of a space from the end of the text data in binary data.

## Delimited and CSV Extract Options

You can specify these options for delimited and CSV format data record extraction ( `FORMAT DELIMITED` or `FORMAT CSV` data formats, which are aliases).

For details about working with delimited and CSV data, see **Load Delimited and CSV Data**.

| Option Key | Default | Data Type | Option Configurability | De |
|---|---|---|---|---|
| FIELD_DELIMITER | `,` | STRING or ARRAY OF STRINGS | Yes | Op<br><br>Sp<br>ch<br>po<br>for<br>Th<br>se<br>de<br>co<br>Th<br>au<br>int<br>va<br>as<br>str<br>yo<br>sp<br>str<br>`va`<br>re<br>co<br>Th<br>de<br>be<br>Fo<br>**St**<br>**an** |

| Option Key | Default | Data Type | Option Configurability | De |
| --- | --- | --- | --- | --- |
| | | | | **Se**<br>`FI`<br>an<br>`FI`<br>are<br>**Ex**<br>Us<br>cha<br>`FI`<br>`'\`<br>Us<br>cha<br>`FI`<br>`'\|`<br>Us<br>a c<br>`FI`<br>`['`<br><br>**Va**<br>sin<br>cha<br>`''`<br>sin<br>cha |
| RECORD_DELIMITER | `['\r\n', '\n']` | STRING<br>or<br>ARRAY OF<br>STRINGS | Yes | Op<br><br>Sp<br>or<br>str<br>de<br>Th<br>inc<br>usi<br>du<br>Co<br>inc<br>an<br>val<br>or<br>Th<br>au<br>int<br>val<br>as<br>str<br>str<br>`va`<br>rec |

## JSON Extract Options

No options exist for JSON data record extraction ( `FORMAT JSON` ).

For details about JSON-formatted data, see **Load JSON Data**.

### PARQUET Extract Options

You can specify these options for Parquet data record extraction ( `FORMAT ``PARQUET` ).

For details about Parquet-formatted data, see **Load Parquet Data**.

You can extract Parquet files from `S3` , `FILESYSTEM` , and `HDFS` sources.

> ⚠ When you use the `FORMAT PARQUET` option with an AWS S3 Source, the `ENDPOINT` option is required.

| Option Key | Default | Data Type | Option Configurability | Description |
|---|---|---|---|---|
| SCHEMA INFER_FROM | `sample_file` | STRING or ARRAY OF STRINGS | Yes | In the `SCHEMA` syntax, specify h to infer the Parqu schema. The supported value are: `sample_file` — Infer from a ranc file. list of files — Infe from a list of file with filenames th have valid full pa and do not inclu a leading forwar slash. **Examples:** `SCHEMA {` `INFER_FROM` sample_file `}` `<br/>` SCHEMA |

### XML Extract Options

No options exist for the XML format extraction ( `FORMAT XML` ).

For details about XML-formatted data, see **Load XML Data**.

## Bad Data Targets

Bad data represents records that the Ocient System could not load due to errors in the transformations or invalid data in the source records. You can provide options for a bad data target that the Ocient System uses during pipeline execution to capture the records that are not loaded. The original bytes that the pipeline tried to load are captured in the bad data target along with the metadata about the error, such as the error message or source.

Kafka is the only supported bad data target.

## Kafka Bad Data Target

When you use Kafka as a bad data target, the Ocient System produces the original bytes of the source record into the Kafka topic of your choice. The Ocient System includes the metadata about the record in the header of the record as it is sent to Kafka. You can configure the Kafka topic on your Kafka Brokers using the retention and partition settings of your choice.

You can use a Kafka bad data target with any data source (e.g., S3, local file, and so on).

> ⚠ If the Kafka Broker is unreachable when the Ocient System attempts to produce a bad data record to the bad data target, the system logs an error on the Loader Node, and the pipeline continues.

### Example

This example `CREATE PIPELINE` SQL statement snippet contains a bad data target definition using the `BAD_DATA_TARGET` option.

SQL

```
CREATE PIPELINE ...
    BAD_DATA_TARGET
        KAFKA
        TOPIC 'orders_errors'
        BOOTSTRAP_SERVERS '111.11.111.1:9092,111.11.111.2:9092'
        CONFIG '{"compression.type": "gzip"}'
    SOURCE
        ...
    EXTRACT
        ...
INTO public.orders
SELECT
    $order.billing.name as username,
    $order.subtotal as subtotal,
    ...
```

## Kafka Bad Data Target Options

| Option Key | Default | Data Type | Option Configurability | Description |
|---|---|---|---|---|
| BOOTSTRAP_SERVERS | None | STRING | Yes | A comma-delin list of `IP:port` pairs that cont the IP addresse the Kafka Brok and the associ port number. **Example:** `BOOTSTRAP_SER = '111.11.111.1 ,111.11.111.2 '` |
| TOPIC | None | STRING | Yes | The name of th Kafka topic wh the Ocient Sys should produce data records. |
| CONFIG | `'{ "compression.type ": "none" }'` | JSON-formatted STRING | Yes | Optional.<br><br>The **producer configuration** |

| Option Key | Default | Data Type | Option Configurability | Description |
| --- | --- | --- | --- | --- |
| | | | | the Kafka prod should use. |

## Advanced Pipeline Tuning Options

You can use pipeline tuning options to control the parallelism or batching dynamics of your pipelines. This tuning can throttle the resources used on a pipeline or increase parallel processing across Loader Nodes. These options are advanced settings that might require a detailed understanding of the underlying mechanics of the loading infrastructure in the Ocient System to employ. Due to the inherent nature of each source type, the behavior of these options can differ between file-based and Kafka-based loads. All these options are optional.

| **Option Key** | **Default** | **Data Type** | **Option Configurability** | **Description** | | --- | --- | --- | --- | --- | | CORES | The maximum number of CPU cores available on each Loader Node. | INTEGER | Yes | Maximum number of processing threads that the Ocient System uses during execution on each Loader Node. The system creates this number of threads on each Loader Node.
The Ocient System automatically determines the default value by finding the number of cores of a Loader Node. You can use this option for performance tuning.
The calculation for maximum parallelism of a pipeline is: `number_of_loaders * CORES`.
**About Kafka Partitions and Parallelism**
For Kafka streaming pipelines, this option determines the number of Kafka Consumers created on each Loader Node.
For Kafka Pipelines, the recommendation is that `number_of_loaders * CORES` equals the number of Kafka topic partitions.
If this number exceeds the number of Kafka topic partitions, the work might spread unevenly across Loader Nodes.
If this number is less than the number of Kafka topic partitions, some Kafka Consumers might receive uneven amounts of work. In this case, use a value for `number_of_loaders * CORES` that is an even divisor of the number of Kafka topic partitions to avoid a skew in the rates of processing across partitions.

**Value Range:** 1 to 1,024. | | PARTITIONS | Equal to the value of CORES. | INTEGER | Yes | Specifies the number of partitions over which to split the file list. Not applicable to Kafka streaming pipelines.

The Ocient System automatically sets a default value based on the configured value for the `CORES` option. You can use this option for performance tuning.
The number of partitions determines how many buckets of work the Ocient System generates for each batch of files processed on a Loader Node. The pipeline processes this number of partitions in parallel using the specified number of cores.
If you specify fewer partitions than cores, some cores are not fully utilized, and resources are wasted. If you specify more partitions than cores, the Ocient System divides partitions in a round-robin fashion over the available cores.

**Value Range:** 1 to 2,048. | | BATCH_SIZE | A dynamic value, determined by the Ocient System for each pipeline to maximize performance. | INTEGER | Yes | Number of rows in the batch to load at one time.
The Ocient System automatically calculates a dynamic value depending on the table columns and the utilization of internal buffers to transfer records to the database backend. You can use this option to turn off the dynamic adjustments for performance tuning.
⚠ Only change this setting in rare cases where loading performance is slower than expected, and you have a large record size. If this setting is improperly set, pipelines might fail with out-of-memory exceptions.
You can configure the default value (for the batch payload target) using a SQL statement such as:
`ALTER SYSTEM ALTER CONFIG SET`
`'streamloader.extractorEngineParameters.configurationOption.osc.batch.payload.target`
`' '65536'`

**Value Range:** 1 to 1,073,741,824. | | RECORD_NUMBER_FORMAT | For file loads that do not use the **EXPLODE_OUTER** function, the default is `[19, 45, 0]`.
For Kafka streaming pipelines that do not use the `EXPLODE_OUTER` function, the default is `[0, 64, 0]`.
For loads that use the `EXPLODE_OUTER` function, the default is the specified load-type-specific default value with 13 subtracted from the record index bits. The system adds these bits to the bits for rows within a record.
For example, the default for file loads that use this function is `[19, 32, 13]`. | ARRAY | Yes | The 64-bit record number for each record of the load. This number uniquely identifies a row within its partition.
The format is an array with three values in the format`[, , ]`
The file index bits “ value is the number of bits used to represent the file index within a

partition.
The record index bits “ value is the number of bits used to represent the record index within a file.
The rows per record index bits “ is the number of bits used to represent the row within a record. The system uses this value with the `EXPLODE_OUTER` function.
These three values must sum to 64.
**Example**
`RECORD_NUMBER_FORMAT= [10, 54, 0]`
Set the number of file index bits to `10` and the number of record index bits to `54`, allowing up to 2^10 files and 2^54 records per file. The system does not support the `EXPLODE_OUTER` function in this configuration because the rows per record index bits are `0`. | |

# DROP PIPELINE

`DROP PIPELINE` removes an existing pipeline in the current database. You cannot remove a pipeline that is in the `RUNNING` or `QUIESCING` status. To remove a pipeline that is running, first execute the `STOP PIPELINE` or `QUIESCE PIPELINE` SQL statement.

You must have the DROP privilege on the pipeline to execute this SQL statement. For details, see **Data Control Language (DCL) Statement Reference**.

> ⚠ When you drop a pipeline, the Ocient System also removes the associated system catalog information, such as pipeline errors, events, files, partitions, and metrics.

### Syntax

```
SQL

DROP PIPELINE [ IF EXISTS ] pipeline_name [, ...]
```

| Parameter | Data Type | Description |
|---|---|---|
| `pipeline_name` | string | The name of the specified pipeline to remove.<br>You can drop multiple pipelines by specifying additional pipeline names, separated by commas. |

### Examples

### Remove Existing Data Pipeline

Remove an existing pipeline named `ad_data_pipeline`.

```
SQL

DROP PIPELINE ad_data_pipeline;
```

### Remove Existing Data Pipeline by Checking for Existence

Remove an existing pipeline named `ad_data_pipeline` or return a warning if the Ocient System does not find the pipeline in the database.

```
SQL

DROP PIPELINE IF EXISTS ad_data_pipeline;
```

## PREVIEW PIPELINE

`PREVIEW PIPELINE` enables you to view the results of loading data for a specific `CREATE PIPELINE` SQL statement without creating a whole data pipeline and without storing those results in the target table. Using this SQL statement, you can iterate quickly and modify the syntax as needed to achieve your expected results. After you confirm your expected results, you can use the same syntax in the body of the `CREATE PIPELINE` statement with the appropriate source.

A table must exist in the database to serve as the target of your `PREVIEW PIPELINE` statement. This table ensures the pipeline matches the column types of the target table. However, the execution of this statement does not load data into the target table.

### Preview Sources

The `SOURCE INLINE` source type is available only for the `PREVIEW PIPELINE` SQL statement. You cannot create a data pipeline with inline source data. The inline source data limit is 1,000 rows.

Other source types defined in the `CREATE PIPELINE` statement, `S3`, `KAFKA`, and `FILESYSTEM`, are compatible with the `PREVIEW PIPELINE` statement. The extract options

vary by the source type to mirror the `CREATE PIPELINE` statement. The database returns 10 records by default.

## Preview Error Handling

Pipeline-level errors cause the `PREVIEW PIPELINE` SQL statement to fail. The Ocient System returns an error and no result set. However, the Ocient System accumulates record-level errors that occur during the execution of this statement in a single warning that the system returns along with the result set. Each line of the warning describes a record-level error in human-readable form or as a JSON blob, depending on the value of the `SHOW_ERRORS_AS_JSON` option. Rows or columns that encounter record-level errors have `NULL` values in the result set.

## Preview Limitations

Limitations of this SQL statement are:

- Before executing a `PREVIEW PIPELINE` SQL statement, you must create a table for the Ocient System to have context for the preview.
- The maximum number of rows a `PREVIEW PIPELINE` SQL statement can return is 1,000 rows.
- The `COLUMN_DEFAULT_IF_NULL` option from the `CREATE PIPELINE` SQL statement has no effect on the `PREVIEW PIPELINE` SQL statement.
- The `PREVIEW PIPELINE` SQL statement does not honor the assignment of a service class based on text matching.
- These source options are not supported:
  - `START_FILENAME`
  - `END_FILENAME`
- When you execute two duplicate `PREVIEW PIPELINE` statements for a specific Kafka topic, the two statements share a consumer group. If the topic is small, one or both of the result sets might only be a partial result.
- For multiple tables, you can preview only one table at a time. You must specify the name of the table you want to preview using the `FOR` keyword.
- Previewing a continuous data pipeline is not supported.

### Syntax

SQL

```
PREVIEW PIPELINE pipeline_name
    [ MODE mode ]
    [ SHOW_ERRORS_AS_JSON show_errors_as_json ]
    SOURCE [ INLINE ] (inline_string | <s3_source> | <filesystem_source> | <kafka_s
        [ LIMIT limit ]
    EXTRACT
        FORMAT csv
        RECORD_DELIMITER record_delimiter
        FIELD_DELIMITERS ['delim1', 'delim2', ...]
        [ INTERMEDIATE_VALUES intermediate_values ]
[ INSERT ] INTO created_tablename
SELECT
    preview_column_formula AS preview_column_name, ...
[ WHERE filter_expression ]
[ [ INSERT ] INTO created_tablename_n
SELECT
    preview_column_formula AS preview_column_name, ...
[ WHERE filter_expression ] ] [ ,... ]
[ FOR created_tablename_n ]
```

Though this syntax shows the CSV format, you can also use the `PREVIEW PIPELINE` statement with the other formats.

| Parameter | Data Type | Description |
|---|---|---|
| `pipeline_name` | string | The name of the specified data pipeline for the preview. |
| `created_tablename` | identifier | The identifier for the name of the table that you create before executing the `PREVIEW PIPELINE` SQL statement. |
| `created_tablename_n` | identifier | For multiple tables, the identifier for the name of another table that you create before executing the `PREVIEW PIPELINE` SQL statement. Use the `FOR` keyword to specify which table content to preview. |
| `preview_column_formula` | identifier | The identifier for the formula of the data to load.<br>For example, for the data in the first field of the inline source, use `$1`.<br><br>If you need to add a transformation, you can use functions to transform data, such as `CONCAT($1, $2)`, to load the concatenation of the first two fields in the inline source data. |

| Parameter | Data Type | Description |
| --- | --- | --- |
| `preview_column_name` | identifier | The name of the column in the target table. |

## SQL Statement Options

| Option Key | Default | Data Type | Description |
| --- | --- | --- | --- |
| SOURCE INLINE | Required | STRING | The string that contains data for the preview of the data pipeline load. For example, source data can be `'oci,ent,ocient\|ware,house,warehouse'`, where `\|` is the record delimiter and `,` is the field delimiter. For special characters, such as `\t`, use an escape sequence such as `e'oci,ent,oci\tent\|ware,house,ware\thouse'`.<br><br>This option supports these text-based formats: CSV, JSON, and XML. |
| MODE | `'transform'` | STRING | Indicates whether to perform a validation of the PREVIEW PIPELINE SQL statement.<br><br>Valid values are: `'validate'` and `'transform'`.<br><br>Set this option to `'validate'` to check whether the creation of the data pipeline succeeds. If the pipeline is valid, the statement produces no output. Otherwise, the statement returns an error. A valid data pipeline has the correct syntax for the source and extract options, as well as any transformation functionality. After you have a valid pipeline with the `PREVIEW PIPELINE` statement, you can simply replace the `PREVIEW` keyword with `CREATE` to create the pipeline. |

| Option Key | Default | Data Type | Description |
|---|---|---|---|
| | | | Set this option to `'transform'` to retrieve a preview of the results of the pipeline. |
| SHOW_ERRORS_AS_JSON | `false` | BOOLEAN | Indicates whether to show errors. Values are `true` or `false`. If the value is `true`, the Ocient System returns record-level errors as JSON blobs rather than human-readable messages. |
| LIMIT | 10 | INTEGER | The number of rows, specified as an integer, to return in the preview results for sources with many rows. The default value is 10 rows. |
| INTERMEDIATE_VALUES | `false` | BOOLEAN | Indicates whether to capture intermediate values during a transformation sequence. Values are `true` or `false`. If the value is `true`, the Ocient System appends an extra column to the result set. Each value in the column contains a JSON blob that describes the intermediate values processed for each column after each transformation. |

You must specify at least one column name in the `SELECT` part of the syntax. The name of the specified column must match the name of the column in the created table. The number of columns in the `SELECT` part can be less than those in the created table. With this mismatch, the `PREVIEW PIPELINE` SQL statement might succeed even if the `CREATE PIPELINE` statement fails.

For definitions of other extract options, see the `CREATE PIPELINE` SQL statement options in **CREATE PIPELINE**.

### Examples

#### Preview Pipeline Using CSV Format

Preview the load of two rows of data. First, create a table to serve as the context for the load. The `previewload` table contains three columns with these data types: string,

integer, and Boolean.

```sql
CREATE TABLE previewload (col1 VARCHAR, col2 INT, col3 BOOLEAN);
```

Create the preview pipeline `testpipeline` with this data: `'hello,2,true|bye,3,false'`. Specify the CSV extract format, `|` record delimiter, and the `,` field delimiter. Load the data without transformation.

```sql
PREVIEW PIPELINE testpipeline
    SOURCE INLINE 'hello,2,true|bye,3,false'
    EXTRACT
        FORMAT CSV
        RECORD_DELIMITER '|'
        FIELD_DELIMITERS [',']
INTO previewload
SELECT
    $1 AS col1,
    $2 AS col2,
    $3 AS col3;
```

## Output

```text
col1                                              col2       col3
\-----------------------------------------------------------------
hello                                             2          true
bye                                               3          false

Fetched 2 rows
```

Delete the `previewload` table.

SQL

```
DROP TABLE previewload;
```

### Preview Pipeline Using CSV Format with Escape Characters

Preview the load of two rows of data. First, create a table to serve as the context for the load. The `previewload` table contains three columns with these data types: string, integer, and Boolean.

SQL

```
CREATE TABLE previewload (col1 VARCHAR, col2 INT, col3 BOOLEAN);
```

Create the preview pipeline `testpipeline` with this data: `'hello\tworld,2,true|bye\tworld,3,false'`. Specify the CSV extract format, `|` record delimiter, and `,` field delimiter. Load the data without transformation. In this case, the data contains the special character `\t`. You must escape the character by using the escape sequence `e`.

SQL

```
PREVIEW PIPELINE testpipeline
    SOURCE INLINE e'hello\tworld,2,true|bye\tworld,3,false'
    EXTRACT
        FORMAT CSV
        RECORD_DELIMITER '|'
        FIELD_DELIMITERS [',']
    INTO previewload
    SELECT
        $1 AS col1,
        $2 AS col2,
        $3 AS col3;
```

## Output

Text

```
col1                                              col2       col3
\-------------------------------------------------------------------
hello   world                                       2        true
bye     world                                       3        false

Fetched 2 rows
```

Delete the `previewload` table.

SQL

```
DROP TABLE previewload;
```

### Preview Pipeline Using CSV Format with Transformation

Create a table to serve as the context for the load. The `previewload` table contains three string columns.

SQL

```
CREATE TABLE previewload (col1 VARCHAR, col2 VARCHAR, col3 VARCHAR);
```

Create the preview pipeline `testpipeline` with this data: `'hello,world|bye,world'`. Specify the CSV extract format, `|` record delimiter, and the `,` field delimiter. Load the data with a transformation to concatenate the two strings and return the result in the third column.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

SQL

```
PREVIEW PIPELINE testpipeline
    SOURCE INLINE 'hello,world|bye,world'
    EXTRACT
        FORMAT CSV
        RECORD_DELIMITER '|'
        FIELD_DELIMITERS [',']
    INTO previewload
    SELECT
        $1 AS col1,
        $2 AS col2,
        CONCAT($1,$2) AS col3;
```

## Output

Text

```
col1                                                col2
\-------------------------------------------------------------------------------
hello                                               world
bye                                                 world

Fetched 2 rows
```

The third column contains the concatenated result of the first two columns.

Delete the `previewload` table.

SQL

```
DROP TABLE previewload;
```

### Preview Pipeline Using the Kafka Source

Create the `previewload` table with these columns:

- `id` — Non-NULL integer
- `salut` — Non-NULL string

- `name` — Non-NULL string
- `surname` — Non-NULL string
- `zipcode` — Non-NULL integer
- `age` — Non-NULL integer
- `rank` — Non-NULL integer

SQL

```
CREATE TABLE previewload (
    id INT NOT NULL,
    salut VARCHAR(3) NOT NULL,
    name VARCHAR(10) NOT NULL,
    surname VARCHAR(10) NOT NULL,
    zipcode INT NOT NULL,
    age INT NOT NULL,
    rank INT NOT NULL);
```

Create the preview pipeline `test_small_kafka_simple_csv`. Specify the `ddl_csv` topic. Indicate that the Kafka consumer should not write its durably-made record offsets to the Kafka Broker by using the `WRITE_OFFSETS` option set to `false`. Specify the bootstrap server as `servername:0000` and configuration options as `"auto.offset.reset": "earliest"` by using the `BOOTSTRAP_SERVERS` and `CONFIG` options, respectively. Limit the returned results to three rows by using the `LIMIT` option. Specify the CSV extract format and `\n` record delimiter by using the `FORMAT` and `RECORD_DELIMITER` extract options, respectively.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

SQL

```
PREVIEW PIPELINE test_small_kafka_simple_csv
    SOURCE KAFKA
        TOPIC 'ddl_csv'
        WRITE_OFFSETS false
        BOOTSTRAP_SERVERS 'servername:0000'
        CONFIG '{"auto.offset.reset": "earliest"}'
        LIMIT 3
    EXTRACT
        FORMAT csv
        RECORD_DELIMITER '\n'
    INTO previewload
    SELECT
        INT($1) AS id,
        CHAR($2) AS salut,
        CHAR($3) AS name,
        CHAR($4) AS surname,
        INT($5) AS zipcode,
        INT($6) AS age,
        INT($7) AS rank;
```

Text

```
id          salut                                                  name
\-------------------------------------------------------------------------------
105         Mr                                                     Jmhsuxofspx
101         Mr                                                     Ijmmtbddkyh
109         Mr                                                     Bigohpwfwmr

# QUIESCE PIPELINE

`QUIESCE PIPELINE` stops the execution of the specified data pipeline gracefully. When you execute this SQL statement, the pipeline transitions to the `QUIESCING` status. The Ocient System creates no new work units and waits for all in-flight work units to finish.

After the in-flight work finishes, the pipeline transitions to the `QUIESCED` status and the statement returns.

A quiesced pipeline provides a clean breakpoint with no partially loaded files:

- For a batch pipeline, every file that belongs to the quiesced pipeline in the `sys.pipeline_files` system catalog table is in the `LOADED`, `FAILED`, `LOADED_WITH_ERRORS`, or `PENDING` status.
- For continuous pipelines with monitors and Kafka streaming pipelines, the pipeline commits all consumed messages to the external sources and stops consuming before it transitions to the `QUIESCED` status. Every file that belongs to the quiesced pipeline in the `sys.pipeline_files` system catalog table is in the `LOADED`, `FAILED`, `LOADED_WITH_ERRORS`, or `PENDING` status.

Because all loaded data is durable and the pipeline retains its load position, you can safely execute the `ALTER PIPELINE`, `DROP PIPELINE`, or `START PIPELINE` SQL statement on a quiesced pipeline without the risk of missing or duplicate data.

In contrast, the `STOP PIPELINE` SQL statement stops the pipeline as soon as possible and can leave files in intermediate statuses. For details, see **STOP PIPELINE**.

The `QUIESCE PIPELINE` SQL statement has these behaviors:

- You can quiesce a pipeline only in the `RUNNING` status. You cannot quiesce a pipeline in the `COMPLETED`, `FAILED`, `STOPPED`, or `QUIESCED` status, or a pipeline that has never started.
- Consecutive `QUIESCE PIPELINE` statements on the same pipeline are idempotent. Only the first statement signals the pipeline to shut down.
- To interrupt a graceful stop that takes too long, execute the `STOP PIPELINE` SQL statement on the pipeline in the `QUIESCING` status. The Ocient System interrupts the drain and stops the pipeline as soon as possible.
- If the in-flight work units reach the error limit of the pipeline during the quiesce, the pipeline transitions to the `FAILED` status.
- The `QUIESCE PIPELINE` SQL statement returns after the pipeline reaches one of the inactive statuses: `STOPPED`, `QUIESCED`, `COMPLETED`, or `FAILED`.
- Kafka streaming pipelines that set the `VERSION` source option to `1` do not support the `QUIESCE PIPELINE` SQL statement. To stop these pipelines, use the `STOP`

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

`PIPELINE` statement.

The Ocient System logs the `QUIESCING` and `QUIESCED` events in the `sys.pipeline_events` system catalog table. You can monitor the status of the pipeline in the `information_schema.pipeline_status` view.

### Required Privileges

You must have the EXECUTE privilege on the pipeline to execute this SQL statement. For details, see **Data Control Language (DCL) Statement Reference**.

### Syntax

```
SQL

QUIESCE PIPELINE pipeline_name
```

| Parameter | Data Type | Description |
|---|---|---|
| `pipeline_name` | string | The name of the specified data pipeline. |

### Example

Quiesce an existing pipeline named `ad_data_pipeline`.

```
SQL

QUIESCE PIPELINE ad_data_pipeline;
```

After the statement returns, the pipeline is in the `QUIESCED` status. To resume the pipeline, execute the `START PIPELINE` SQL statement.

## START PIPELINE

`START PIPELINE` begins the execution of the specified data pipeline that extracts data and loads it into the target tables specified by the `CREATE PIPELINE` SQL statement. You can execute `START PIPELINE` when the pipeline is in the `STOPPED`, `FAILED`, or `QUIESCED` status. A newly created pipeline has the `STOPPED` status. The pipeline

transitions to the `QUEUED` status while it waits for the Ocient System to schedule it, and then to the `RUNNING` status after it begins to process data.

When you execute the `START PIPELINE` SQL statement, the Ocient System creates a static list of files in the `sys.pipeline_files` system catalog table and marks them with the `PENDING` status. After the system assigns a file to an underlying task, the system marks the file as `QUEUED`. After the system verifies that the file exists, the system marks the file as `LOADING` to signify that a Loader Node has started reading the source data. Finally, upon successfully loading the file, the system transitions the status of the file to the terminal status `LOADED`.

A Kafka streaming pipeline never enters the `COMPLETED` state in the `information_schema.pipeline_status` view. Instead, the pipeline remains running after you start the pipeline until you stop it or the pipeline reaches the specified error limit using the `ERROR LIMIT` option.

You must have the EXECUTE privilege on the pipeline and the INSERT privilege on any table that is a target in the pipeline. For details, see **Data Control Language (DCL) Statement Reference**.

### Syntax

SQL

```
START PIPELINE pipeline_name
    [ ERROR
        [ LIMIT <integer_value> ]
        [ FILE_ERROR (FAIL | SKIP_MISSING_FILE | TOLERATE) ] ]
    [ USING LOADERS <loader_names> ]
    [ ON COMPLETION (NO_FLUSH | FLUSH_AND_WAIT | FLUSH_AND_RETURN) ]
```

| Parameter | Data Type | Description |
|---|---|---|
| `pipeline_name` | string | The name of the specified data pipeline. |

### SQL Statement Options

| Option Key | Default | Data Type | Description |
| --- | --- | --- | --- |
| ERROR LIMIT `<integer_value>` | 0 | INTEGER | Error log option that determines the number of record-level errors that can occur during the execution of a pipeline that the load tolerates before the whole pipeline execution fails.<br>`<integer_value>` is a number greater than or equal to -1. When you set `<integer_value>` to -1, the load tolerates an unlimited number of record-level errors.<br>By default, continuous pipelines tolerate an unlimited number of record-level errors, whereas batch pipelines tolerate zero errors.<br><br>With multiple target tables, record-level errors are specific to a table. For example, if a transformation for loading one table succeeds but another transformation for loading another table fails, the row corresponding to the successful transformation loads to the first table but not the other. |
| ERROR FILE_ERROR `<error_action>` | `FAIL` | STRING | For pipelines that load data from S3 or local file sources, this error configuration option determines how to treat unrecoverable file-level errors. Examples of unrecoverable file-level errors are:<br><br>The file is listed when the pipeline starts, but is missing later during the load.<br><br>The Gzip file is corrupted and cannot be decompressed.<br><br>The file cannot be downloaded from the source.<br><br>Record-level error that is not tolerable occurs when tokenizing or transforming data in the file.<br><br>`<error_action>` can be one of these keywords:<br>`FAIL` — Fail the whole pipeline |

| Option Key | Default | Data Type | Description |
| --- | --- | --- | --- |
| | | | because of a file-level error.<br>`SKIP_MISSING_FILE` — Only tolerate errors that occur due to missing files. If a file exists in the list when the pipeline starts but is missing later during the load, skip the file and continue with the next file.<br>`TOLERATE` — Tolerate all unrecoverable file-level errors. In this mode, the load also tolerates an unlimited number of record-level errors.<br>The `FAILED`, `SKIPPED`, and `LOADED_WITH_ERRORS` file statuses appear in the `sys.pipeline_files` system catalog tables, respectively, and indicate how the pipeline handled the file error.<br><br>**Value Range:** `FAIL`, `SKIP_MISSING_FILE`, or `TOLERATE`. |
| USING LOADERS<br>`loader_names` | `NULL` | LIST OF STRINGS | Specify one or more names of Loader Nodes as a comma-separated list for executing the `START PIPELINE` SQL statement. If you do not use this option, the Ocient System uses all of the Loader Nodes that are active to execute the pipeline.<br>You can find node names in the `sys.nodes` system catalog table. |
| ON COMPLETION<br>`<completion_mode>` | `NO_FLUSH` | STRING | Completion type option that specifies the behavior when the pipeline finishes loading. This option determines when the remaining pages are converted into Segments.<br>`NO_FLUSH` — Do not force a flush of pages. Rely on watermarks and timeouts to trigger final conversion to Segments.<br>`FLUSH_AND_WAIT` — Trigger a flush of pages, initiating final conversion to Segments. The pipeline blocks and waits for the conversion to Segments to complete before marking the pipeline as `COMPLETED`.<br>`FLUSH_AND_RETURN` — Trigger a flush of pages, initiating the final conversion to Segments. The Ocient |

| Option Key | Default | Data Type | Description |
| --- | --- | --- | --- |
| | | | System marks the pipeline as `COMPLETED` immediately following the flush without waiting for conversion to Segments to complete. |

For the query to execute successfully, the specified node names must identify nodes that have:

- `ACTIVE` operational status
- `streamloader` role

When you execute the `START PIPELINE` SQL statement, the Ocient System creates a static list of files only for batch pipelines and a dynamic list for continuous pipelines in the `sys.pipeline_files` system catalog table.

### Examples

Start an existing pipeline named `ad_data_pipeline` with default settings.

SQL

```
START PIPELINE ad_data_pipeline;
```

Start an existing pipeline named `ad_data_pipeline` with error tolerance (tolerate 10 errors before aborting the pipeline). For details about error tolerance, see **Error Tolerance in Data Pipelines**.

SQL

```
START PIPELINE ad_data_pipeline
    ERROR LIMIT 10;
```

Data pipelines log a message for each pipeline error to the `sys.pipeline_errors` system catalog table, even if you do not specify the ERROR option. Use `BAD_DATA_TARGET` settings to capture the original source data.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

Start an existing pipeline named `ad_data_pipeline` using the Loader Node named `stream-loader1`.

```SQL
START PIPELINE ad_data_pipeline
    USING LOADERS "stream-loader1";
```

To resume a pipeline with file loading, see **Data Pipeline Behavior Considerations**.

To restart a Kafka data pipeline, see **Data Pipeline Behavior Considerations**.

For pipeline dependencies, see **Data Pipeline Behavior Considerations**.

# STOP PIPELINE

`STOP PIPELINE` stops the execution of the pipeline and its associated tasks as soon as possible. The Ocient System interrupts in-flight work, and the pipeline transitions to the `STOPPED` status. Files can remain in intermediate statuses, such as `LOADING` or `QUEUED`. To stop a pipeline gracefully with no partially loaded files, use the **QUIESCE PIPELINE** SQL statement instead. You can also execute `STOP PIPELINE` on a pipeline in the `QUIESCING` status to interrupt a graceful stop.

After you stop a pipeline, you can execute the `START PIPELINE` SQL statement on the pipeline to run the pipeline again. Regardless, the load deduplicates any records previously loaded in the same pipeline.

You must have the EXECUTE privilege on the pipeline to execute this SQL statement. For details, see **Data Control Language (DCL) Statement Reference**.

### Syntax

```SQL
STOP PIPELINE pipeline_name
```

| Parameter | Data Type | Description |
| --- | --- | --- |
| `pipeline_name` | string | The name of the specified data pipeline. |

### Example

Stop an existing pipeline named `ad_data_pipeline`.

SQL

```
STOP PIPELINE ad_data_pipeline;
```

You can see the status of the parent tasks in the `sys.tasks` system catalog table and see the status of the child tasks in the `sys.subtasks` system catalog table.

## ALTER PIPELINE

`ALTER PIPELINE` updates the configuration and transformations of an existing data pipeline. The statement performs an in-place modification that preserves the existing state of the pipeline, including its identifier, durability horizon, and metrics. You can rename the pipeline, update the advanced tuning options, bad data target, source, monitor, lookup sources, and extraction options, and evolve the data pipeline schema in the `SELECT` clause. For a comparison with the `CREATE OR REPLACE PIPELINE` SQL statement, see **Update a Pipeline**. For details about schema evolution, see **Load Avro Data**.

> To execute this SQL statement, the data pipeline must be inactive, which means that it has the `STOPPED`, `QUIESCED`, `COMPLETED`, or `FAILED` status. You can use the `QUIESCE PIPELINE` SQL statement to stop the execution of the data pipeline gracefully, or the `STOP PIPELINE` statement to stop it immediately, before you alter it.

All sections of the statement are optional, but you must specify at least one section. The statement changes only the sections that you specify. Other parts of the pipeline remain unchanged. Specified sections must adhere to the rules defined in **SOURCE Options**, **LOOKUP Options**, **EXTRACT Options**, **Bad Data Targets**, and **Advanced Pipeline Tuning Options**.

© 2026 Ocient, Inc

For pipelines with multiple tables, specify each `SELECT` clause for tables in the existing pipeline. Each `WHERE` clause must match the corresponding clause of the existing pipeline. Use the `FORCE` keyword to change a non-backward-compatible schema or to add, modify, or remove `WHERE` clauses. When you specify the `FORCE` keyword, the statement replaces all `WHERE` clauses of the existing pipeline with the `WHERE` clauses in the `ALTER PIPELINE` statement. If the existing pipeline contains multiple `WHERE` clauses and you specify only a subset of them, the statement drops the `WHERE` clauses that you omit.

### Required Privileges

You must have the ALTER privilege on the pipeline to execute this SQL statement. For details, see **Data Control Language (DCL) Statement Reference**.

### Syntax

SQL

```
ALTER PIPELINE [ IF EXISTS ] pipeline_name
    [ RENAME TO pipeline_new_name ]
    [ <advanced_pipeline_options> ]
    [ BAD_DATA_TARGET <kafka_bad_data_target> ]

    [ SOURCE ( <s3_source> | <filesystem_source> | <hdfs_source> | <kafka_source> )
        [ MONITOR ( <sqs_monitor> | <kafka_monitor> ) ] ]

    [ LOOKUP lookup_source <lookup_options> ]  [ ... ]

    [ EXTRACT
        ( <delimited_extract_options> | <asn1_extract_options> |
        <avro_extract_options> | <json_extract_options> |
        <parquet_extract_options> | <binary_extract_options> |
        <xml_extract_options> )
        [ <general_extract_options> ] ]

    [ [ INSERT ] INTO destination_table_name

    SELECT
        expression as col_alias_target,
        expression2 as col_alias_target2,
        ...
    [ WHERE filter_expression ]

    [ [ INSERT ] INTO destination_table_name_n
    SELECT
        expression_n as col_alias_target_n,
        expression2_n as col_alias_target2_n,
        ...
    [ WHERE filter_expression_n ] ] [ ... ] ]

    [ FORCE ]
```

For the definitions of the syntax subsections, see the **CREATE PIPELINE** SQL statement.

| Parameter | Data Type | Description |
|---|---|---|
| `pipeline_name` | string | The name of the specified pipeline to alter. |
| `pipeline_new_name` | string | The new name of the data pipeline. |

### Limitations

The `ALTER PIPELINE` SQL statement has these limitations:

- If the pipeline has the `COMPLETED` status, you can only rename the pipeline.
- You cannot alter the pipeline type, source type, or monitor type.
- You cannot alter the target tables. If the pipeline has multiple target tables, the statement must include all transformations for all tables. You cannot alter the list or the order of the target tables.
- If an option is not configurable, the `FORCE` keyword does not make the option configurable. The **Option Configurability** column in each options table indicates whether you can alter the option.
- Altering options can affect loading results.
- The statement must not contain a `FROM` clause. If you include a `FROM` clause, the system rejects the statement.
- When you configure a section, you must specify the section name to avoid ambiguity. The section names are `BAD_DATA_TARGET`, `SOURCE`, `MONITOR`, `LOOKUP`, `EXTRACT`, and `INTO`. If the section name has an associated value, you must also specify the value. For example, to alter the `SECRET_ACCESS_KEY` option for an S3 source and an SQS monitor, you must specify `SOURCE S3` and `MONITOR SQS`.

> ⚠ Altering options requires the pipeline to have the `QUIESCED` status. If the pipeline has the `FAILED` or `STOPPED` status, you can use the `FORCE` keyword, but do so with caution. Altering a pipeline with the `FAILED` status can cause data duplication.

### Examples

#### Rename a Data Pipeline

Rename an existing pipeline named `x` to `y` without changing any other part of the pipeline.

SQL

```
ALTER PIPELINE x RENAME TO y;
```

### Rename a Data Pipeline and Change the Source Connection Configuration

Rename an existing pipeline named `x` to `y` and update the configuration of its HDFS source.

SQL

```
ALTER PIPELINE x RENAME TO y SOURCE HDFS CONFIG '{"dfs.client.socket-timeout": 300C
```

### Rename a Data Pipeline and Change the Extraction and Transformations

Rename an existing pipeline named `x` to `y`, update the extraction schema inference to use the `new_file.avro` file, and update the transformation for the `t` table to load the `new_field` source field into the `new_col` column.

SQL

```
ALTER PIPELINE x RENAME TO y EXTRACT INFER_FROM ['new_file.avro'] INTO t SELECT $ne
```

### Rename a Data Pipeline and Update the Source Credentials

Rename an existing pipeline named `orders_pipeline` to `sales_pipeline` and update the access credentials of its S3 source.

SQL

```
ALTER PIPELINE orders_pipeline
    RENAME TO sales_pipeline
    SOURCE S3
        ACCESS_KEY_ID 'new_access_key_id'
        SECRET_ACCESS_KEY 'new_secret_access_key';
```

### Update Credentials for an S3 Source and an SQS Monitor

Update the secret access key of the S3 source and the SQS monitor for an existing pipeline named `orders_pipeline`. Even though the statement alters only the `SECRET_ACCESS_KEY` options, you must specify the `SOURCE S3` and `MONITOR SQS` section names.

SQL

```
ALTER PIPELINE orders_pipeline
    SOURCE S3
        SECRET_ACCESS_KEY 'new_secret_access_key'
    MONITOR SQS
        SECRET_ACCESS_KEY 'new_monitor_secret_access_key';
```

### Schema Evolution Examples

The remaining examples demonstrate schema evolution and use this table and data pipeline definition. You must stop the execution of the data pipeline before performing schema evolution operations.

Create the `users` table with these columns:

- `id` — Universally Unique IDentifier (UUID) of the user
- `firstname` — First name of the user
- `lastname` — Last name of the user
- `birthyear` — Year of birth
- `groups` — List of groups where the user belongs

SQL

```
CREATE TABLE users(
    id         UUID NOT NULL,
    firstname  VARCHAR(255) NOT NULL,
    lastname   VARCHAR(255) NOT NULL,
    birthyear  INT,
    groups     VARCHAR(255)[] NOT NULL DEFAULT 'char[]'
);
```

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

Assume you have user data in Avro format in multiple files in the `/data/users` directory. Create the `users_pipeline` data pipeline for the Avro files containing user data `*.avro`. The schema configuration instructs the system to infer from a random file using the `INFER_FROM` option.

SQL

```
CREATE PIPELINE users_pipeline
    SOURCE filesystem
        FILTER '/data/users/*.avro'
    EXTRACT
        FORMAT avro
        SCHEMA {
            INFER_FROM sample_file
        }
INTO users
SELECT
    $id         AS id,
    $firstname  AS firstname,
    $lastname   AS lastname,
    $birthyear  AS birthyear;
```

Start the data pipeline.

SQL

```
START PIPELINE users_pipeline;
```

### Schema Evolution with a Column Addition

Stop the data pipeline.

SQL

```
STOP PIPELINE users_pipeline;
```

Change the schema of an existing pipeline named `users_pipeline` to add the `groups` column. Access the array of strings within the column.

```sql
ALTER PIPELINE users_pipeline
INTO users
SELECT
    $id         AS id,
    $firstname  AS firstname,
    $lastname   AS lastname,
    $birthyear  AS birthyear,
    $groups[]   AS groups;
```

Start the data pipeline again.

```sql
START PIPELINE users_pipeline;
```

### Check Whether the Data Pipeline to Change Exists for Column Addition

Stop the data pipeline.

```sql
STOP PIPELINE users_pipeline;
```

Change the schema of an existing pipeline named `users_pipeline` to add the `groups` column. Use the `IF EXISTS` keywords to check whether the data pipeline exists. Access the array of strings within the column.

```sql
ALTER PIPELINE IF EXISTS users_pipeline
INTO users
SELECT
    $id         AS id,
    $firstname  AS firstname,
    $lastname   AS lastname,
    $birthyear  AS birthyear,
    $groups[]   AS groups;
```

© 2026 Ocient, Inc

Start the data pipeline again.

```sql
START PIPELINE users_pipeline;
```

### Schema Evolution with a Column Removal

Stop the data pipeline.

```sql
STOP PIPELINE users_pipeline;
```

Change the schema of an existing pipeline named `users_pipeline` to remove the `birthyear` column.

```sql
ALTER PIPELINE users_pipeline
INTO users
SELECT
    $id         AS id,
    $firstname  AS firstname,
    $lastname   AS lastname;
```

Start the data pipeline again.

```sql
START PIPELINE users_pipeline;
```

### Schema Evolution with a Column Data Type Modification

Stop the data pipeline.

```sql
STOP PIPELINE users_pipeline;
```

Change the schema of an existing pipeline named `users_pipeline` to narrow the `INT` data type to a `SMALLINT` type for the `birthyear` column using the `SMALLINT` casting function.

SQL

```
ALTER PIPELINE users_pipeline
INTO users
SELECT
    $id         AS id,
    $firstname  AS firstname,
    $lastname   AS lastname,
    SMALLINT($birthyear)  AS birthyear;
```

Start the data pipeline again.

SQL

```
START PIPELINE users_pipeline;
```

### Schema Evolution with the Addition of a Filter Condition

Stop the data pipeline.

SQL

```
STOP PIPELINE users_pipeline;
```

Change the schema of an existing pipeline named `users_pipeline` to filter the year of birth to be greater than 1950 using the `WHERE` clause. Add the `FORCE` keyword to instruct the data pipeline to evolve the schema with the filter condition.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

```sql
ALTER PIPELINE users_pipeline
INTO users
SELECT
    $id         AS id,
    $firstname  AS firstname,
    $lastname   AS lastname,
    $birthyear  AS birthyear
WHERE
    $birthyear > 1950
FORCE;
```

Start the data pipeline again.

```sql
START PIPELINE users_pipeline;
```

## ALTER PIPELINE RENAME

`ALTER PIPELINE RENAME TO` SQL statement changes the name of the pipeline object, while retaining its identifier, options, and other metadata. The Ocient System reflects this change in the `sys.pipelines` system catalog table. Then, you must use the new name when you refer to the pipeline in SQL statements.

> ⚠ If you rename a Kafka streaming pipeline that does not specify the `GROUP_ID` option, the consumer group identifier changes with the name, because the default identifier derives from the name of the pipeline. The renamed pipeline does not resume from the last committed offset of the original consumer group. Instead, it starts according to the `auto.offset.reset` policy, which can reload data from the beginning of the topic or skip to the end of it. To preserve the position of the load across a rename, specify the `GROUP_ID` option when you create the pipeline.

You must have the ALTER privilege on the pipeline to execute this SQL statement. For details, see **Data Control Language (DCL) Statement Reference**.

### Syntax

```sql
ALTER PIPELINE [ IF EXISTS ] pipeline_original_name RENAME TO pipeline_new_name
```

| Parameter | Data Type | Description |
|---|---|---|
| `pipeline_original_name` | string | The name of the existing data pipeline. |
| `pipeline_new_name` | string | The new name of the data pipeline. |

### Example

Rename an existing pipeline named `ad_data_pipeline` to `renamed_pipeline`.

```sql
ALTER PIPELINE ad_data_pipeline RENAME TO renamed_pipeline;
```

# EXPORT PIPELINE

`EXPORT PIPELINE` returns the `CREATE PIPELINE` SQL statement used to create the pipeline object. You can use the output of this statement to recreate an identical pipeline when you remove the original pipeline.

> The execution of this statement censors sensitive S3 values like `ACCESS_KEY_ID` and `SECRET_ACCESS_KEY` and Kafka **Consumer Configuration** password-type fields. The database replaces them with `*`.

To execute this statement, you must have the VIEW privilege on the pipeline and any table the pipeline targets. For details, see **Data Control Language (DCL) Statement Reference**.

### Syntax

```sql
EXPORT PIPELINE pipeline_name
```

| Parameter | Data Type | Description |
| --- | --- | --- |
| `pipeline_name` | string | The name of the specified data pipeline. |

### Example

Export an existing pipeline in the database `ad_data_pipeline`.

SQL

```
EXPORT PIPELINE ad_data_pipeline;
```

# CREATE PIPELINE FUNCTION

`CREATE PIPELINE FUNCTION` enables you to define a function for loading data. Define the function behavior using the Apache® Groovy™ language. For details bout this language, see **The Apache Groovy Programming Language**.

Function arguments and output are strongly typed and immutable.

You can test the execution of your function using the `PREVIEW PIPELINE` SQL statement.

> The Ocient System does not support the overload of function names.

### Syntax

SQL

```
CREATE [ OR REPLACE ] PIPELINE FUNCTION [ IF NOT EXISTS ]
    function_name( input_argument [, ...] )
    LANGUAGE GROOVY
    RETURNS output_argument_definition
    IMPORTS [ library_name [, ...] ]
    AS $$
        groovy_declaration
    $$
```

| Parameter | Type | Description |
| --- | --- | --- |
| `function_name` | string | A unique identifier for the data pipeline function. |
| `input_argument` | string | The name of one or more input arguments of the function. Specify data types for input arguments according to the support data types defined in **Data Types for Data Pipelines**.<br>For the data type declaration, use `NOT NULL` where applicable for maximum performance. |
| `output_argument_definition` | string | The type definition of the output from the function. |
| `library_name` | string | The name of one or more Java libraries.<br>You can include libraries by using the `IMPORTS` clause or specifying the fully-qualified class (e.g., `java.lang.Integer`) path in the source definition. |
| `groovy_declaration` | string | The Groovy definition of the function. |

## Install and Enable Third-Party Libraries

You can use the default list of supported third-party libraries or additional third-party libraries that you install.

### Supported Libraries

Data pipeline functions can import classes from the default list of supported third-party libraries. This table provides the resources for each supported library package.

| Library Package | Resource |
| --- | --- |
| `java.lang.*` | **java.lang** |
| `java.util.*` | **java.util** |
| `java.nio.ByteBuffer.*` | **ByteBuffer** |
| `groovy.json.*` | **groovy.json** |
| `groovy.xml.*` | **groovy.xml** |
| `groovy.yaml.*` | **groovy.yaml** |
| `org.apache.groovy.datetime.extensions.*` | **org.apache.groovy.datetime.extensions** |
| `org.apache.groovy.dateutil` | **org.apache.groovy.dateutil.extensions** |

| Library Package | Resource |
| --- | --- |
| `com.ocient.streaming.data.types.*` | **Data Types for User-Defined Data Pipeline Functions** |

## Additional Libraries

You can install and enable additional third-party libraries to import for use in your data pipeline functions.

You must install the JAR package on all Loader Nodes in the `/opt/ocient/current/lib/extractorengine_udt` folder.

Then, add the fully qualified class name in the function import list as part of the `library_name` parameter. For example, to reference the `ByteBuffer` class from the `com.fastbuffer` package, specify `com.fastbuffer.ByteBuffer` in the `library_name` parameter and use the class in the Groovy definition as `var x = new com.fastbuffer.ByteBuffer()`.

## Groovy Data Type Mapping

For the Groovy definition, the Ocient System maps its SQL data type to the corresponding Groovy data type. Your Groovy code should use the Groovy data type defined in this table for any input arguments and output.

| SQL Data Type | Groovy Data Type |
| --- | --- |
| `BIGINT` | `java.lang.Long` |
| `BINARY(N) or HASH(N)` | `byte[]` |
| `BOOLEAN` | `java.lang.Boolean` |
| `CHAR(N) or VARCHAR(N)` | `java.lang.String` |
| `DATE` | `java.time.LocalDate` |
| `DECIMAL(P,S)` | `com.ocient.streaming.data.types.Decimal` |
| `DOUBLE` | `java.lang.Double` |
| `INT` | `java.lang.Integer` |
| `IPV4` | `java.net.Inet4Address` |
| `IP` | `java.net.Inet6Address` |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| SQL Data Type | Groovy Data Type |
| --- | --- |
| `ST_POINT` | `com.ocient.streaming.data.types.gis.STPoint` |
| `ST_LINESTRING` | `com.ocient.streaming.data.types.gis.STLinestring` |
| `ST_POLYGON` | `com.ocient.streaming.data.types.gis.STPolygon` |
| `FLOAT` | `java.lang.Float` |
| `SMALLINT` | `java.lang.Short` |
| `TIME` | `com.ocient.streaming.data.types.Time` |
| `TIMESTAMP` | `com.ocient.streaming.data.types.Timestamp` |
| `BYTE` | `java.lang.Byte` |
| `TUPLE<<type1, type2, …>>` | `com.ocient.streaming.data.types.OcientTuple` |
| `TYPE[]` | `java.util.List<TYPE>` |
| `UUID` | `java.util.UUID` |
| `VARBINARY(N)` | `byte[]` |
| `VARCHAR(N)` | `java.lang.String` |

### Example

Create the `sort_function` data pipeline function to sort an array of integers. The function has two input arguments: `value`, a non-NULL array of integers, and `ascending`, the sort order. The function returns a non-NULL array of integers. If `value` is empty, the function throws an error.

The function imports these Java libraries:

- `java.lang.Integer`
- `java.util.ArrayList`
- `java.util.Collections`
- `java.util.Comparator`
- `java.util.List`

Define the Groovy code. Because the input arguments do not change, the example Groovy code first copies the `value` argument, sorts the copied list according to the sort order, and returns the sorted array.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

SQL

```
CREATE PIPELINE FUNCTION
    sort_function( value INT[] NOT NULL, ascending BOOLEAN NOT NULL)
    LANGUAGE GROOVY
    RETURNS INT[] NOT NULL
    IMPORTS [
        'java.lang.Integer',
        'java.util.ArrayList',
        'java.util.Collections',
        'java.util.Comparator',
        'java.util.List'
        ]
    AS $$
        /* Throw an error if the array is empty */
        if (value.isEmpty()){
            throw new PipelineFunctionException("Unexpected empty array");
        }

        /* Make a copy of the list. */
        List<Integer> sorted = new ArrayList<>((List<Integer>)value);

        /* Sort the array elements according to the specified order. */
        sorted.sort(ascending ? Comparator.naturalOrder() : Comparator.reverseOrder

        /* Return the sorted array. */
        return sorted;
    $$;
```

View the creation information about the `sort_function` function using the `sys.pipeline_functions` system catalog table. This statement returns the function name, return type, argument names, data types of the arguments, and the list of imported libraries.

SQL

```
SELECT name, return_type, argument_names, argument_types, imported_libraries
FROM sys.pipeline_functions;
```

# DROP PIPELINE FUNCTION

`DROP PIPELINE FUNCTION` removes an existing pipeline function.

You must have the DROP privilege on the pipeline function to execute this SQL statement. For details, see **Data Control Language (DCL) Statement Reference**.

### Syntax

```
SQL

DROP PIPELINE FUNCTION [ IF EXISTS ] function_name [, ...]
```

| Parameter | Data Type | Description |
|---|---|---|
| `function_name` | string | The name of the specified data pipeline function to remove.<br>You can drop multiple pipelines by specifying additional function names, separated by commas. |

### Examples

#### Remove the Existing Pipeline Function

Remove an existing pipeline function named `sort_function`.

```
SQL

DROP PIPELINE FUNCTION sort_function;
```

#### Remove an Existing Pipeline Function by Checking for Existence

Remove an existing pipeline function named `sort_function` or return a warning if the Ocient System does not find the function in the database.

```
SQL

DROP PIPELINE FUNCTION IF EXISTS sort_function;
```

# EXPORT PIPELINE FUNCTION

`EXPORT PIPELINE FUNCTION` returns the `CREATE PIPELINE FUNCTION` SQL statement used to create the pipeline function. You can use the output of this statement to recreate an identical pipeline function when you remove the original function.

### Required Privileges

To execute this statement, you must have the VIEW privilege on the pipeline function. For details, see the **Data Control Language (DCL) Statement Reference**.

### Syntax

```
SQL

EXPORT PIPELINE FUNCTION function_name
```

| Parameter | Data Type | Description |
|---|---|---|
| `function_name` | string | The name of the specified data pipeline function. |

### Example

Return the `CREATE PIPELINE FUNCTION` SQL statement for the existing pipeline function named `sort_function`.

```
SQL

EXPORT PIPELINE FUNCTION sort_function;
```

## Output

Text

```
export
--------------------------------------------
CREATE PIPELINE FUNCTION "clamp_function"("value" INT NOT NULL, "low" INT NOT NULL,
    LANGUAGE groovy
    RETURNS INT NOT NULL
    IMPORTS []
    AS $$
/* Reject an invalid range. */
        if (low > high) {
            throw new PipelineFunctionException("Invalid range: low > high");
        }

        /* Clamp the value to the inclusive range [low, high]. */
        if (value < low) {
            return low;
        }
        if (value > high) {
            return high;
        }

        /* The value is already within range. */
        return value;
    $$;

Fetched 1 row
```

# Transactional Data Pipelines

This page describes transactional data pipelines that enable the rollback of uncommitted data automatically when a failure occurs.

Transactional data pipelines in Ocient® load data in batches and automatically roll back all uncommitted data when a failure occurs. The `CREATE TRANSACTIONAL PIPELINE` SQL statement supports a `START FOREGROUND` clause that creates a pipeline, immediately starts it, and blocks the SQL session until the pipeline reaches an inactive state — either `COMPLETED` or `FAILED`. This approach provides a single-command batch loading from within a SQL session.

> **Info:** The `START FOREGROUND` clause is only valid for `TRANSACTIONAL` pipelines. The Ocient System rejects this clause on `CONTINUOUS` and `BATCH` pipelines.

## CREATE TRANSACTIONAL PIPELINE

The `CREATE TRANSACTIONAL PIPELINE` SQL statement creates a new transactional data pipeline in the current database or replaces an existing one when you specify the `OR REPLACE` keywords. When you include the `START FOREGROUND` clause, the statement also starts the pipeline immediately and blocks until the pipeline reaches an inactive state. You can also update an existing transactional pipeline in place with the `ALTER PIPELINE` SQL statement. For details, see **ALTER PIPELINE** and **Update a Pipeline**.

```
CREATE [OR REPLACE] TRANSACTIONAL PIPELINE pipeline_name
    SOURCE source_type source_options
    EXTRACT extract_options
    INTO table_name
    SELECT column_list
    [START FOREGROUND
        [ERROR (LIMIT n, FILE_ERROR {FAIL | SKIP_MISSING_FILE | TOLERATE})]
        [USING LOADERS loader_name [, ...]]
        [ON COMPLETION {NO_FLUSH | FLUSH_AND_WAIT | FLUSH_AND_RETURN}]
    ]
;
```

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Parameter | Type | Description |
|---|---|---|
| `pipeline_name` | Identifier | The name of the pipeline to create. The name must be distinct from any existing pipeline names in the current database. |
| `source_type` | Identifier | The type of data source (for example, `S3` or `HDFS`). See **CREATE PIPELINE** for supported values. |
| `source_options` | Varies | Source-specific connection and configuration settings. See **CREATE PIPELINE** for details. |
| `extract_options` | Varies | Format and parsing settings for the source data. See **CREATE PIPELINE** for details. |
| `table_name` | Identifier | The target table for loading data. |
| `column_list` | String | The list of columns for the load. |
| `n` | INTEGER | The maximum number of errors the system permits before the pipeline transitions to the `FAILED` status. |
| `loader_name` | Identifier | The name of a Loader Node to use for this pipeline run. Separate multiple Loader Node names with commas in the `USING LOADERS` clause. |

The `ERROR` clause controls how the system behaves with errors. The `LIMIT` keyword limits the number of errors. The `FILE_ERROR` keyword denotes the behavior when a source file is missing or unreadable. The `FAIL` value causes the pipeline to fail immediately. The `SKIP_MISSING_FILE` value silently skips missing files. And the `TOLERATE` value records the error and continues loading.

The `ON COMPLETION` clause controls segment generation after the pipeline completes. The default value is `NO_FLUSH`. The `FLUSH_AND_WAIT` value denotes that the system flushes segments synchronously before returning. The `FLUSH_AND_RETURN` value denotes that the system initiates a flush and returns immediately.

## START FOREGROUND Clause

The `START FOREGROUND` clause is not valid in combination with the `IF NOT EXISTS` clause. When you omit the `START FOREGROUND` clause, the `CREATE TRANSACTIONAL PIPELINE` statement creates the pipeline without starting it, and all existing behavior is unchanged.

The `ERROR`, `USING LOADERS`, and `ON COMPLETION` sub-clauses within the `START FOREGROUND` clause behave identically to the same clauses as in the `START PIPELINE`

SQL statement.

## Blocking Behavior

When you execute the `CREATE TRANSACTIONAL PIPELINE ... START FOREGROUND` SQL statement, the SQL session blocks for the full duration of pipeline execution. The session does not return until the pipeline reaches an inactive state ( `COMPLETED` or `FAILED` ).

If you disconnect from the SQL session during pipeline execution, for example, by pressing Ctrl+C at the command line, the pipeline continues running independently. The disconnection does not stop or cancel the pipeline. After the pipeline reaches an inactive state, the Ocient System records the final status and all associated events in the `sys.pipelines` and `sys.pipeline_events` system catalog tables.

## Queuing Behavior

If all pipeline concurrency slots are occupied when you execute the statement, the system places the pipeline in a `QUEUED` state. The SQL session remains blocked while the pipeline is queued and continues to block after a concurrency slot opens, until the pipeline itself reaches an inactive state. You can monitor the pipeline status in the `sys.pipelines` system catalog table from a separate session during this time.

## Error Behavior

When the pipeline reaches the `COMPLETED` state, the statement returns successfully. When the pipeline reaches the `FAILED` or `STOPPED` state, the statement throws a `SQLException` error that contains the status message of the pipeline.

The `ERROR LIMIT` and `FILE_ERROR` keywords control failure thresholds in the same way as in the `START PIPELINE` statement. When the number of errors exceeds the `LIMIT` value, the pipeline transitions to the `FAILED` state.

## Transactional Rollback

On failure, the system automatically rolls back the transactional storage scope. The system does not commit any data from the failed pipeline run to the target table. This rollback behavior is identical to any other transactional pipeline failure and requires no special handling.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

## Pipeline Lifecycle

Pipelines started with the `START FOREGROUND` clause follow the same lifecycle as any other pipeline. The system records all lifecycle events, including `CREATED`, `RUNNING`, `COMPLETED`, and `FAILED` states, in the `sys.pipeline_events` table. The `STARTED` event includes the start options used for the run, providing a complete audit trail. After the pipeline reaches an inactive state, the pipeline object persists in the `sys.pipelines` system catalog table with full metadata and metrics.

## Examples

### Create a Transactional Pipeline with an Error Limit

This statement creates a transactional pipeline that loads CSV files from Amazon® Web Services℠ (AWS℠) S3, tolerates up to 100 errors, and blocks until loading completes or the system exceeds the error limit.

```
CREATE OR REPLACE TRANSACTIONAL PIPELINE my_pipeline
    SOURCE S3
        ENDPOINT 'https://s3.us-east-1.amazonaws.com'
        BUCKET 'ocient-docs'
        FILTER 'metabase_samples/csv/orders.csv'
        ENABLE_PATH_STYLE_ACCESS true
    EXTRACT FORMAT CSV
        FIELD_DELIMITER ','
        NUM_HEADER_LINES 1
    INTO my_schema.my_table
    SELECT
        $1 as id,
        $2 as user_id,
        $3 as product_id
    START FOREGROUND
        ERROR LIMIT 100, FILE_ERROR TOLERATE
        ON COMPLETION FLUSH_AND_WAIT;
```

### Create a Transactional Pipeline Using a Specific Loader Node

This statement creates a transactional pipeline using a specific Loader Node and returns as soon as the pipeline completes or fails, with no segment flush.

```
CREATE OR REPLACE TRANSACTIONAL PIPELINE sales_pipeline
    SOURCE S3
        ENDPOINT 'https://s3.us-east-1.amazonaws.com'
        BUCKET 'ocient-docs'
        FILTER 'metabase_samples/csv/orders.csv'
        ENABLE_PATH_STYLE_ACCESS true
    EXTRACT FORMAT CSV
        FIELD_DELIMITER ','
        NUM_HEADER_LINES 1
    INTO sales.transactions
    SELECT
        $1 as id,
        $2 as user_id,
        $3 as product_id
    START FOREGROUND
        USING LOADERS loader_node_1
        ON COMPLETION NO_FLUSH;
```

# Distributed Tasks

Overview of distributed tasks in Ocient, including rebuild tasks and data integrity checks that run in the background to maintain system health and performance.

You can manage distributed tasks in the Ocient® System. These tasks are processes that execute in the background to keep the system running smoothly and efficiently. These DDL commands create tasks to rebuild damaged or missing segment data and check data integrity.

For information on managing tasks, see **Manage Distributed Tasks**.

## CREATE TASK

Launches a new task.

### Privileges

To create any task, you must have the System Administrator role, which has the `UPDATE` privileges on the system.

### Syntax

SQL

```
CREATE TASK [ task_name ]
    TYPE { rebuild | check_disk | rebalance }
    [ LOCATION { SYSTEM | CLUSTER cluster_name | NODE node_name } ]
    [ OPTIONS task_option_map [, ... ] ]
```

To create a task, you must specify a task type `TYPE`:

- **rebuild** — Reconstruct data segments by using erasure-coded data in the same segment group.
- **check_disk** — Verify segments on a node by computing checksums.
- **rebalance** — Distribute data evenly across disks in the system.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

You can also optionally specify a location using the `LOCATION` keyword to execute the task. Supported values include:

- `SYSTEM` — Targets all segments in the system. If you do not specify the `LOCATION` keyword, `SYSTEM` is the default value.
- `CLUSTER` — Targets a specific cluster.
- `NODE` — Targets a specific node.

| Parameter | Data Type | Description |
|---|---|---|
| `task_name` | String | Optional.<br><br>The identifier for the task. |
| `TYPE` | String | Required. Specifies the type of the distributed task to create. Supported tasks are:<br><br>`rebuild` — Rebuild task<br>`check_disk` — Check disk task<br>`rebalance` — Rebalance task<br><br>Task names are case sensitive. |
| `node_name` | String | This argument is required only if your task targets a node with the `LOCATION NODE` keywords.<br><br>The name of a specific node for the task to target. |
| `cluster_name` | String | This argument is required only if your task targets a cluster with the `LOCATION CLUSTER` keywords.<br><br>The name of a specific cluster for the task to target. |
| `task_option_map` | Key-value pairs | Optional. A comma-separated list of task-specific options in key-value pair format `key = value`. |

## `rebuild` Task

Performing a rebuild segment operation reconstructs data segments by using erasure-coded data in the same segment group. This task allows the system to restore segments that are in the damaged `DAMAGED` or missing `MISSING` status to full performance. For details on rebuild tasks, see **Guide to Rebuilding Segments**.

The `rebuild` task supports only the `SYSTEM` and `CLUSTER` locations. If you attempt the rebuild task on the node, the system returns an error.

To rebuild a single node, use the cluster location with the `LOCATION CLUSTER` keywords. Include the name of the node you want to rebuild as one of the key-value options.

### `rebuild` Options ( `task_option_map` )

The rebuild task supports these options. You must specify these options as a comma-separated list of key-value pairs.

| Option Key | Value Type | Description |
|---|---|---|
| `node` | String | Limits the rebuild operation to only segments on the specified node. |
| `segment_groups` | List | Limits the rebuild operation to the specified segment group identifiers. Specify this option as a bracketed list, e.g., `[ id1, id2, ... ]`. |
| `table_id` | String | Limits the rebuild to segment groups belonging to a specific table identifier. |

### Examples

#### Rebuild All Segments on the System

This example performs a system-wide rebuild task.

SQL

```
CREATE TASK TYPE rebuild LOCATION SYSTEM;
```

#### Rebuild Segments on the Specific Table

This example rebuilds all segments on a system for the specified table with the table identifier `529a2e9d-d06c-46cd-a93b-624d3bed1c08`.

SQL

```
CREATE TASK TYPE rebuild OPTIONS table_id = '529a2e9d-d06c-46cd-a93b-624d3bed1c08';
```

### Rebuild Segments on the Specific Cluster

This example rebuilds segments on the Foundation cluster `my_lts_cluster1`.

SQL

```
CREATE TASK TYPE rebuild LOCATION CLUSTER my_lts_cluster1;
```

### Rebuild Segments on the Specific Node

This example rebuilds segments on the Foundation Node `my_node1` in the Foundation Cluster `my_lts_cluster1`.

SQL

```
CREATE TASK TYPE rebuild LOCATION CLUSTER my_lts_cluster1 OPTIONS node = 'my_node1'
```

### Rebuild the Specific Segment Group

This example rebuilds segments in the segment group with the identifier `53` in the Foundation Cluster `my_lts_cluster1`.

SQL

```
CREATE TASK TYPE rebuild LOCATION CLUSTER my_lts_cluster1 OPTIONS segment_groups =
```

### Create a Named Task

This example creates the rebuild task named `my_rebuild_task` in the Foundation Cluster `my_lts_cluster1`.

SQL

```
CREATE TASK my_rebuild_task TYPE rebuild LOCATION CLUSTER my_lts_cluster1;
```

## `check_disk` Task

The `check_disk` task verifies the integrity of data segments on storage nodes by computing checksums. The task compares stored checksums with recomputed ones to

detect disk corruption.

### `check_disk` Options ( `task_option_map` )

The `check_disk` task supports these options. You must specify these options as a comma-separated list of key-value pairs.

| Option Key | Value Type | Description |
|---|---|---|
| `fix` | Boolean | If you set this option value to `true`, the task modifies the storage cluster state based on the checksum result. For example, if the task finds a segment that fails the checksum, the task sets its segment state to `DAMAGED`.<br><br>Otherwise, the task reports any segments that fail the checksum, but it does not alter segment states.<br><br>The default value is `false`. |
| `sample` | Boolean | If you set this option value to `true`, the task checks only a sample of data in each segment.<br><br>The default value is `false`. |
| `only_unhealthy` | Boolean | If you set this option value to `true`, the task checks only segments that are not in the `INTACT` state.<br><br>The default value is `false`. |
| `storage_ids` | List | This option limits the `check_disk` task to only a specific list of storage identifiers. Specify these storage identifiers as a bracketed list, e.g., `[ 'id1', 'id2', ... ]`. |

## Examples

### Perform Checksum on the Specific Node

This example computes the checksum on all segments on storage node `my_node1`.

SQL

```
CREATE TASK TYPE check_disk LOCATION NODE 'my_node1';
```

### Perform a Checksum on the Specific Cluster

This example computes a checksum for a sample of blocks in each segment of the storage cluster `my_lts_cluster1` using the `sample = true` key-value pair.

```
SQL

CREATE TASK TYPE check_disk LOCATION CLUSTER my_lts_cluster1 OPTIONS sample = true;
```

### Compute Checksum on the Specific Storage Identifier

This example computes a checksum for the segment with the storage identifier `529a2e9d-d06c-46cd-a93b-624d3bed1c08` on the storage node `my_node1`.

```
SQL

CREATE TASK TYPE check_disk LOCATION NODE 'my_node1' OPTIONS storage_ids = [ '529a2
```

## `rebalance` Task

Rebalancing evenly distributes data across disks in the system. Execute this task if data is not properly balanced across the system, such as after adding nodes or drives.

For details on performing a `rebalance` task, see **Expand and Rebalance System**.

> The `rebalance` task supports only `SYSTEM` and `CLUSTER` locations. If you attempt the rebalance task on a node, the system returns an error.

### Example

This example performs a rebalance task across all foundation clusters.

```
SQL

CREATE TASK TYPE rebalance;
```

# CANCEL TASK

Cancels a running task. The `KILL TASK` statement is a synonym for `CANCEL TASK` and behaves identically.

### Privileges

To cancel a task, you must be assigned the System Administrator role.

### Syntax

```
SQL

{ CANCEL | KILL } TASK ('task_name' | 'task_id')
```

| Parameter | Data Type | Description |
|---|---|---|
| `task_name` | string | The name specified on task creation. This applies only if an optional name was created for the task. |
| `task_id` | string | The unique identifier for the task in the system tables.<br>For rebuild tasks, you can find the unique identifier in the **sys.result_cache** table.<br>For check disk tasks, you can find the unique identifier in the **sys.subtasks** table. |

### Example

Cancel a task named `my_task`.

```
SQL

CANCEL TASK 'my_task';
```

# DROP TASK

Drops orphaned or completed tasks from the system.

The task identifier must be a task Universally Unique IDentifier (UUID). The statement does not accept task names because names are not globally unique. A name becomes reusable after its prior task reaches a terminal status, which makes name-based lookup ambiguous. The terminal task statuses are `FAILED`, `CANCELLED`, `INVALID`, `COMPLETE`, and `QUIESCED`.

By default, when you do not specify any optional keywords, the `DROP TASK` SQL statement drops a single leaf task. The database throws an error if the task has children

or is not in a terminal status.

### Privileges

To drop a task, you must be assigned the System Administrator role.

If you have the System Administrator role, you can drop any task. If you are not an administrator, you can drop COALESCE tasks for which you have `CREATE` privileges or pipeline tasks for which you have `EXECUTE` privileges.

### Syntax

```SQL
DROP TASK [ IF EXISTS ] uuid [ CASCADE ] [ FORCE ]
```

| Parameter | Data Type | Description |
|---|---|---|
| `uuid` | string | The task UUID, which is the unique identifier for the task in the system tables. The statement does not accept task names. |

The optional keywords are:

- `IF EXISTS` — Prevents the statement from returning an error when the task is not found.
- `CASCADE` — Drops the entire subtree rooted at the specified task. All tasks in the subtree must be in a terminal status.
- `FORCE` — Skips the terminal-status checks. You can combine the `FORCE` with `CASCADE` keywords to force the drop of an entire subtree regardless of task status.

> Generally, terminal tasks automatically roll off the system, so executing the `DROP TASK` SQL statement is not necessary. However, the `FORCE` and `CASCADE` keywords can help you drop orphaned tasks from the system in the event of an internal lockup. Be aware that this statement can unintentionally delete the state of in-progress tasks.

### Examples

### Drop a Single Leaf Task

This example drops a single leaf task using its UUID.

```
SQL

DROP TASK '529a2e9d-d06c-46cd-a93b-624d3bed1c08';
```

### Drop a Task Only If It Exists

This example drops a task and does not return an error if the system cannot find it.

```
SQL

DROP TASK IF EXISTS '529a2e9d-d06c-46cd-a93b-624d3bed1c08';
```

### Drop a Task and Its Subtree

This example drops the specified task and all tasks in its subtree. All tasks in the subtree must be in a terminal status.

```
SQL

DROP TASK '529a2e9d-d06c-46cd-a93b-624d3bed1c08' CASCADE;
```

### Force the Drop of a Task Subtree

This example drops the specified task and its entire subtree, regardless of the task status.

```
SQL

DROP TASK '529a2e9d-d06c-46cd-a93b-624d3bed1c08' CASCADE FORCE;
```

# Machine Learning Models

SQL reference for managing Ocient machine learning models, with syntax for CREATE, RENAME, EXPORT, RETRAIN, query, and DROP across 23 model types.

OcientML™ functionality enables you to create a machine learning model, rename the model, export the syntax for the model creation, retrain the model, execute a query against the model, and drop the model.

## CREATE MLMODEL

Train a new machine learning model of type `<model type>` on the result set returned by the SQL SELECT statement. After the database creates the model, `<model name>` becomes a callable function in SQL SELECT statements.

### Syntax

```SQL
CREATE [ OR REPLACE ] MLMODEL <model_name> TYPE <model_type>
    ON( <SQL SELECT statement> ) [options(<option_list>)]
```

### model_name

| Parameter | Data Type | Description |
|---|---|---|
| `model name` | `VARCHAR` | The name of the model to create. |

### model_type

| Parameter | Data Type | Description |
|---|---|---|
| `model type` | `VARCHAR` | The type of machine learning model to create. |

These models are supported. You can find full descriptions of each model in **Regression Models**, **Classification Models**, **Clustering and Dimension Reduction Models**, **Ensemble Models**, or **Other Models**.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

- `SIMPLE LINEAR REGRESSION`
- `MULTIPLE LINEAR REGRESSION`
- `POLYNOMIAL REGRESSION`
- `LINEAR COMBINATION REGRESSION`
- `VECTOR AUTOREGRESSION`
- `KMEANS`
- `KNN (K Nearest Neighbors)`
- `LOGISTIC REGRESSION`
- `NAIVE BAYES`
- `NONLINEAR REGRESSION`
- `MLP`
- `PRINCIPAL COMPONENT ANALYSIS`
- `LINEAR DISCRIMINANT ANALYSIS`
- `SUPPORT VECTOR MACHINE`
- `DECISION TREE`
- `GAUSSIAN MIXTURE MODEL`
- `ASSOCIATION RULES`
- `GRADIENT BOOSTED TREES`
- `REGRESSION TREE`
- `BAGGING`
- `BOOSTING`
- `STACKING`

## option_list

| Parameter | Data Type | Description |
|---|---|---|
| `option_list` | `VARCHAR` | The options for the specified machine learning model that is specified as a comma-separated list in the format: `<option name 1> -> <value 1>, <option name 2> -> <value 2>`, and so on. Names and values must be all enclosed in single quotes and are case sensitive with the exception that Boolean values can be `true`, `false`, `TRUE`, or `FALSE`. Refer to the respective model for the full options |

| Parameter | Data Type | Description |
| --- | --- | --- |
| | | list.<br>Example options list:<br>`options(`<br>`'yIntercept' -> '10',`<br>`'metrics' -> 'true'`<br>`)` |

The SQL SELECT statement that serves as the basis for the model must return rows that fit the specified requirements of the model. For example, in multiple linear regression, the first N columns are the independent variables, and the last column is the dependent variable.

> You cannot create a machine learning model with an existing schema and name combination.

### Example

Assume you created the `mldata` table that contains the data for the model. Then, you can create the `my_model` machine learning model based on that data.

SQL

```
CREATE MLMODEL my_model
TYPE SIMPLE LINEAR REGRESSION ON (
  SELECT
    x1,
    y
  FROM mldata
)
options(
  'yIntercept' -> '10',
  'metrics' -> 'true'
);
```

## ALTER MLMODEL RENAME

Rename a machine learning model. Use the `IF EXISTS` clause to ignore any models that do not exist.

### Required Privileges

To rename a view, you must have the `ALTER MLMODEL` privilege for the model.

The Ocient® System requires these privileges if this statement includes a change to the schema:

- `VIEW` privilege on the current schema of the model
- `VIEW MLMODEL` and `CREATE MLMODEL` privileges on the target schema (if the schema already exists)
- `CREATE MLMODEL` privilege on the database (if the schema does not exist)

### Syntax

SQL

```
ALTER MLMODEL [IF EXISTS] <model name> RENAME TO <new model name>
```

| Parameter | Data Type | Description |
|---|---|---|
| `model name` | `VARCHAR` | The name of the model to rename. |
| `new model name` | `VARCHAR` | The new name of the model. |

### Example

SQL

```
ALTER MLMODEL my_model RENAME TO my_model_slr;
```

## DROP MLMODEL

Drop a machine learning model. Use the `IF EXISTS` clause to ignore any models that do not exist.

### Syntax

```
SQL

DROP MLMODEL [IF EXISTS] model_name [, ...]
```

| Parameter | Data Type | Description |
|---|---|---|
| `model name` | `VARCHAR` | The name of the model to drop.<br>You can drop multiple models by specifying additional names and separating each with commas. |

### Example

Drop the machine learning model `my_model`.

```
SQL

DROP MLMODEL my_model;
```

Drop multiple machine learning models.

```
SQL

DROP MLMODEL my_model1, my_model2;
```

# EXPORT MLMODEL

Return the SQL statement that can recreate the machine learning model.

### Syntax

```
SQL

EXPORT MLMODEL <model name>
```

| Parameter | Data Type | Description |
|---|---|---|
| `model name` | `VARCHAR` | The name of the model to create. |

### Example

```sql
EXPORT MLMODEL my_model;
```

*Output*

```sql
export
-----------------------------------------------
CREATE MLMODEL "my_schema"."my_model" TYPE simple linear regression ON(select x, y

Fetched 1 row
```

The output SQL statement includes the schema explicitly.

## REFRESH MLMODEL

Retrain a machine learning model without changing any model options.

### Syntax

```sql
REFRESH MLMODEL <model name>
```

| Parameter | Data Type | Description |
|---|---|---|
| `model name` | `VARCHAR` | The name of the model to retrain. |

### Example

```sql
REFRESH MLMODEL my_model;
```

# Model Context Protocol Tools

Create, drop, export, and call Model Context Protocol (MCP) tools that expose database operations to AI clients in Ocient.

A Model Context Protocol (MCP) tool is a database object in the Ocient® System that exposes a predefined operation to Model Context Protocol clients, such as AI agents. Each MCP tool has a name, a set of typed arguments, a description, and a definition that the system executes when a client calls the tool. The description helps a client decide when to call the tool.

The system supports two types of MCP tools:

- System Tools — Built-in tools that ship with the database. System tools belong to the `sys` schema, are always visible to every user, and cannot be dropped.
- User-Defined Tools — Tools that you create with the `CREATE MCP TOOL` SQL statement. User-defined tools follow the standard object privilege rules.

Each MCP tool belongs to a toolset, which is a label that groups related tools so that a client can list and select tools by toolset. You can view all MCP tools in the system in the `sys.mcp_tools` system catalog table.

## CREATE MCP TOOL

Creates a user-defined MCP tool. When you specify the `OR REPLACE` clause and the tool already exists, the system replaces the existing tool definition.

### Privileges

To create an MCP tool, you must have the `CREATE` privilege. The user who creates the tool inherits all privileges on the tool. For details, see the **Data Control Language (DCL) Statement Reference**.

### Syntax

SQL

```
CREATE [ OR REPLACE ] MCP TOOL [ IF NOT EXISTS ] tool_name
    [ ( argument_name data_type [ NOT NULL ] [, ...] ) ]
    DESCRIPTION 'description'
    TOOLSET 'toolset'
    AS BEGIN TOOL
        tool_body
    END TOOL;
```

| Parameter | Type | Description |
|---|---|---|
| `tool_name` | Identifier | The name of the MCP tool. You can qualify the name with a database and schema. For details, see **Identifiers**. |
| `argument_name` | Identifier | The name of an argument that the tool accepts. Reference an argument in the tool body with the `@argument_name` syntax. |
| `data_type` | String | The data type of the argument. Specify `NOT NULL` to require a value for the argument. |
| `description` | String | A description of what the tool does. A client uses this description to determine when to call the tool. |
| `toolset` | String | The name of the toolset where the tool belongs. The name can contain spaces. |
| `tool_body` | String | The SQL statement that the system executes when a client calls the tool. The body must include a `RETURN` clause with a `SELECT` statement and can reference arguments with the `@argument_name` syntax. |

### Example

This example creates the `show_tables` MCP tool, which lists the user-defined tables in a schema. The tool belongs to the `System Information` toolset and accepts an optional `schema` argument.

SQL

```
CREATE MCP TOOL show_tables(schema VARCHAR)
    DESCRIPTION 'Lists the user-defined tables within a schema'
    TOOLSET 'System Information'
    AS BEGIN TOOL
        RETURN SELECT * FROM information_schema.tables
            WHERE table_schema NOT IN ('sys', 'information_schema')
            AND table_type = 'BASE TABLE'
            AND (@schema IS NULL OR table_schema = @schema);
    END TOOL;
```

# CALL MCP TOOL

Executes an MCP tool and returns its result set.

### Privileges

To call an MCP tool, you must have the `EXECUTE` privilege on the tool. By default, every user can call system tools.

### Syntax

SQL

```
CALL MCP TOOL tool_name [ ( argument_value [, ...] ) ];
```

| Parameter | Type | Description |
|---|---|---|
| `tool_name` | Identifier | The name of the MCP tool to call. |
| `argument_value` | Any | A value to pass to the corresponding tool argument. |

### Example

This example calls the `show_tables` MCP tool for the `public` schema.

SQL

```
CALL MCP TOOL show_tables('public');
```

# DROP MCP TOOL

Drops a user-defined MCP tool. You cannot drop a system tool. When you specify the `IF EXISTS` clause and the tool does not exist, the system does not return an error.

### Privileges

To drop an MCP tool, you must have the `DROP` privilege on the tool.

### Syntax

```
SQL

DROP MCP TOOL [ IF EXISTS ] tool_name;
```

| Parameter | Type | Description |
|---|---|---|
| `tool_name` | Identifier | The name of the MCP tool to drop. |

### Example

This example drops the `show_tables` MCP tool.

```
SQL

DROP MCP TOOL show_tables;
```

# EXPORT MCP TOOL

Returns the `CREATE MCP TOOL` SQL statement that recreates a user-defined MCP tool.

### Privileges

To export an MCP tool, you must have the `VIEW` privilege on the tool.

### Syntax

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

```sql
EXPORT MCP TOOL tool_name;
```

| Parameter | Type | Description |
| --- | --- | --- |
| `tool_name` | Identifier | The name of the MCP tool to export. |

### Example

This example exports the `show_tables` MCP tool.

```sql
EXPORT MCP TOOL show_tables;
```

# Users, Groups, and Service Classes

Manage users, groups, and service classes in Ocient to control access and allocate resources for workloads with role-based access and workload management.

Users, Groups, and Service Classes are managed using DDL SQL statements that allow administrators to create, drop, or alter each type of database object. These commands also allow administrators to associate service classes with groups and control service class settings for workload management.

## USER

### CREATE USER

`CREATE USER` creates a new user, which is scoped to the database of the active connection processing the DDL statement. This means that usernames can be reused across different databases.

#### Syntax

SQL

```
CREATE USER [ IF NOT EXISTS ] fully_qualified_username <user_definition> [, ...] ]

<user_definition> ::=
    PASSWORD [=] 'password_string' |
    [ FIRST_NAME [=] 'first_name_string' ] |
    [ LAST_NAME [=] 'last_name_string' ] |
    [ EMAIL [=] 'email_string'
```

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Parameter | Data Type | Description |
| --- | --- | --- |
| `fully_qualified_username` | string | A fully qualified username (FQUN) that follows the pattern `user_name@database_name` and uniquely identifies a user in Ocient®.<br>An FQUN can reference a user associated with a different database than the one you are connected to.<br>For FQUN examples, see the table below. |

If you specify only a `user_name` without a `database_name`, Ocient assumes the user is associated with the database of the active connection.

| user id | user name | database name | fully qualified user name (FQUN) |
| --- | --- | --- | --- |
| 000 | alice | db1 | alice@db1 |
| 001 | alice | db2 | alice@db2 |
| 002 | jimmy | system | jimmy@system |

## Define User Parameters ( `<user_definition>` )

You can apply the following optional parameters when creating a new user object.

| Parameter | Data Type | Description |
| --- | --- | --- |
| `password_string` | string | A password for the user account. This parameter is required. |
| `first_name_string` | string | Optional. The first name of the user. |
| `last_name_string` | string | Optional. The last name of the user. |
| `email_string` | string | Optional. The email of the user. |

### Example

This example creates a new user named `jmack@test-database` with the password `pass1234`.

SQL

```
CREATE USER
    "jmack@test-database" PASSWORD = 'pass1234',
    FIRST_NAME = 'Johnny',
    LAST_NAME = 'Mack';
```

## DROP USER

`DROP USER` removes an existing user from the system.

To remove a user, you must possess the `DROP USER` privilege for the user.

SQL

```
DROP USER [ IF EXISTS ] fully_qualified_username [,...]
```

| Parameter | Data Type | Description |
|---|---|---|
| `fully_qualified_username` | string | A fully qualified username (FQUN) that follows the pattern `user_name@database_name` and uniquely identifies a user in Ocient.<br>You can drop multiple users by specifying additional usernames and separating each with commas.<br>An FQUN can reference a user associated with a different database than the one you are connected to. |

If you specify only a `user_name` without a `database_name`, Ocient assumes the user is associated with the database of the active connection.

### Example

This example removes a user named `jmack@test-database`.

SQL

```
DROP USER "jmack@test-database";
```

This example drops multiple users.

SQL

```
DROP USER "jmack@test-database", "jcollins@test-database";
```

## ALTER USER

Change the status of a user using the `ALTER USER` SQL statement.

### Required Privileges

To change the state of a user, you must have `ALTER` privileges on the user or one of these roles:

- System Administrator Role
- Security Administrator Role
- Administrator Role on the database of the user

> Users cannot change their own state.

### Syntax

SQL

```
ALTER USER <user_name> { ENABLE | DISABLE | PASSWORD_EXPIRED }
```

| Parameter | Data Type | Description |
|---|---|---|
| `user_name` | string | The name of the user. |

### Examples

### Enable a User

Enable a user named `example_user`.

SQL

```
ALTER USER example_user ENABLE;
```

### Disable a User

Disable a user named `example_user`.

SQL

```
ALTER USER example_user DISABLE;
```

### Expire the Password of a User

Change the `example_user` user to the `password_expired` state. This action requires the user to update their password on their next successful login.

SQL

```
ALTER USER example_user PASSWORD_EXPIRED;
```

## ALTER USER SET

Changes the password of an existing user.

### Syntax

SQL

```
ALTER USER [ IF EXISTS ] fully_qualified_username SET PASSWORD = password_string
```

| Parameter | Data Type | Description |
|---|---|---|
| `fully_qualified_username` | string | A fully qualified username (FQUN) that follows the pattern `user_name@database_name` and uniquely identifies a user in Ocient.<br>An FQUN can reference a user associated with a different database than the one you are connected to. |
| `password_string` | string | A password for the user account. There are no restrictions on the string used for a password. |

If you specify only a `user_name` without a `database_name`, Ocient assumes the user is associated with the database of the active connection.

### Example

This example changes the password of user `"jmack@test-database"` to `'newpass'`.

```
SQL

ALTER USER "jmack@test-database" SET PASSWORD = 'newpass';
```

# GROUP

## CREATE GROUP

`CREATE GROUP` creates a new group. The name must be distinct from the name of any existing group in the database.

```
SQL

CREATE GROUP [ IF NOT EXISTS ] group_name
```

| Parameter | Data Type | Description |
|---|---|---|
| `group_name` | string | A group name unique from any existing group in the database. |

### Example

This example creates a new group named `group1`.

```
SQL

CREATE GROUP "group1";
```

## DROP GROUP

`DROP GROUP` removes an existing group from the system.

To remove a group, you must possess the `DROP GROUP` privilege for the group.

### Syntax

```
SQL

DROP GROUP [ IF EXISTS ] group_name [, ...]
```

| Parameter | Data Type | Description |
|---|---|---|
| `group_name` | string | The identifier of the group to drop.<br>You can drop multiple groups by specifying additional group names, separated by commas. |

### Example

This example removes a group named `group1`.

```
SQL

DROP GROUP "group1";
```

This example removes multiple groups.

```
SQL

DROP GROUP "group1", "group2";
```

## ALTER GROUP

## ALTER GROUP USER

`ALTER GROUP` adds or removes users from the group using the `USER` keyword.

### Syntax

```
SQL

ALTER GROUP [ IF EXISTS ] groupname { ADD | DROP } USER username [, ...]
```

| Parameter | Data Type | Description |
| --- | --- | --- |
| `group_name` | string | The identifier of the group to alter. |
| `username` | string | A username that uniquely identifies a user in the specified group. |

> If you specify only a `user_name` without a `database_name`, Ocient assumes the user is associated with the database of the active connection.

### Example

This example adds `user1` to an existing group named `group1`.

SQL

```
ALTER GROUP "group1" ADD USER "user1";
```

## ALTER GROUP RENAME

`ALTER GROUP` renames an existing group by including the `RENAME TO` keyword.

### Syntax

SQL

```
ALTER GROUP [ IF EXISTS ] group_name RENAME TO new_group_name
```

| Parameter | Data Type | Description |
| --- | --- | --- |
| `group_name` | string | The identifier of the group to alter. |
| `new_group_name` | string | The new name for the group. |

### Example

This example renames an existing group `group1` to `group2`.

```sql
ALTER GROUP "group1" RENAME TO "group2";
```

## ALTER GROUP SET SERVICE CLASS

Set a service class for the specified group.

### Syntax

```sql
ALTER GROUP group_name SET SERVICE CLASS sc_name
```

| Parameter | Data Type | Description |
|---|---|---|
| `group_name` | string | The identifier of the group to alter. |
| `sc_name` | string | The new name of the service class to assign to the group. To unset a service class from a group and restore defaults, specify “DEFAULT” as the service class name. |

### Example

```sql
ALTER GROUP "wlm_test" SET SERVICE CLASS "high_priority";
```

## ALTER GROUP ALTER SECURITY

Set the security settings at the group level using the `ALTER GROUP ALTER SECURITY` SQL statement. Replace `<security_setting>` with the security setting and `<value>` with the value.

### Syntax

```sql
ALTER GROUP group_name ALTER SECURITY <security_setting> [=] <value>
```

© 2026 Ocient, Inc

| Parameter | Data Type | Description |
| --- | --- | --- |
| `group_name` | string | The identifier of the group for setting security settings. |
| `security_setting` | string | The security setting with values:<br>* `password_minimum_length`<br>* `password_complexity_level`<br>* `password_no_repeat_count`<br>* `password_lifetime_days`<br>* `password_invalid_attempt_limit`<br>For details about these values, see **Database Password Security Settings**. |
| `value` | numeric | An integer to represent one of the security settings. For details about this value, see **Database Password Security Settings**. |

### Example

Set the password lifetime to 10 days for the group `example_group`.

SQL

```
ALTER GROUP example_group
    ALTER SECURITY password_lifetime_days = 10;
```

# SERVICE CLASS

A service class defines a set of limits on various system parameters. You can control access to a service class in two ways:

- Group assignment — An administrator assigns a service class to a group using the `ALTER GROUP SET SERVICE CLASS` statement. All users in that group inherit the service class.
- Privilege grant — An administrator grants the `USE` privilege on a service class to a user, group, or the `PUBLIC` role using the `GRANT USE ON SERVICE CLASS` statement. The grantee can then reference the service class explicitly in the `USING SERVICE CLASS` query clause. For details, see **Service Class Privileges**.

When a query includes the `USING SERVICE CLASS` clause, the system authorizes the request if the user has access through either a group assignment or a `USE` privilege grant. When a query does not include the clause, the system selects a service class

automatically based only on the group assignments of the user and statement text matching rules. The `USE` privilege does not affect automatic service class routing.

## CREATE SERVICE CLASS

The Ocient System applies service classes per group. By default, all groups are in the `DEFAULT` service class, which has no limits.

If a user belongs to multiple groups with different service classes, the system uses the first service class alphabetically by service class name.

### Syntax

SQL

```
CREATE SERVICE CLASS [ IF NOT EXISTS ] sc_name [ <service_class_definition> [, ...] ]

<service_class_definition> ::=
    MAX_TEMP_DISK_USAGE [=] percentage |
    MAX_ELAPSED_TIME [=] time |
    MAX_CONCURRENT_QUERIES [=] queries |
    MAX_ROWS_RETURNED [=] rows |
    MINIMIZE_QUERY_DEBUG_RECORDS [=] minimize_query_debug_records |
    SCHEDULING_PRIORITY [=] priority |
    CACHE_MAX_BYTES [=] cache_max_bytes |
    CACHE_MAX_TIME [=] cache_max_time |
    MAX_ELAPSED_TIME_FOR_CACHING [=] max_elapsed_time_for_caching |
    MAX_COLUMNS_IN_RESULT_SET [=] max_columns_in_result_set |
    PRIORITY_ADJUSTMENT_FACTOR [=] priority_adjustment_factor |
    PRIORITY_ADJUSTMENT_TIME [=] priority_adjustment_time |
    MIN_PRIORITY [=] priority |
    MAX_PRIORITY [=] priority |
    STATEMENT_TEXT { LIKE | REGEX } [=] statement_text_pattern
```

| Parameter | Data Type | Description |
|---|---|---|
| `sc_name` | string | The identifier of the service class. |

### Define Service Classes ( `<service_class_definition>` )

When you create a new service class, the Ocient System sets any omitted service class definitions to the maximum or least restrictive value. Each definition should be comma-separated. When you alter a service class definition, the system modifies only the definition you specify.

See the **Workload Management Walkthrough** for more details.

| Parameter | Description | Values |
|---|---|---|
| `MAX_TEMP_DISK_USAGE` | Limit the percentage of temporary disk space used by the total service class relative to the amount of remaining free space. If all running queries for a particular service class exceed the given percentage, queries fail. | A percentage integer from 0-100. |
| `MAX_ELAPSED_TIME` | Limit query runtime. The database process kills any queries that exceed this limit. | -1 for unlimited, or a positive integer for the number of seconds. |
| `MAX_CONCURRENT_QUERIES` | Limit the maximum number of queries that can run concurrently for a given service class. The database process queues additional queries. | -1 for unlimited, or a positive integer for the number of queries. |
| `MAX_ROWS_RETURNED` | Limit number of rows returned by a query. The database process kills queries that exceed this limit. | -1 for unlimited, or a positive integer for the number of rows. |
| `MINIMIZE_QUERY_DEBUG_RECORDS` | Stop the load of the `sys.completed_operator_instances` system catalog table and the generation of specific debug logs associated with the query. | Boolean `true` for minimizing the capture of metadata and logs, and `false` or unset (default) for capturing this data. |
| `SCHEDULING_PRIORITY` | Limit initial effective query priority. | Any decimal value between the `MIN_PRIORITY` and `MAX_PRIORITY`. |
| `CACHE_MAX_BYTES` | Maximum number of bytes in a result set if the result set can be stored in the cache. This value is the number of bytes in the wire-protocol representation, or what is sent to a client. | -1 for none, or a positive integer for the number of bytes. |
| `CACHE_MAX_TIME` | Maximum time rows are cached. | -1 for none, or a positive integer for the number of seconds. |

© 2026 Ocient, Inc

| Parameter | Description | Values |
| --- | --- | --- |
| `MAX_ELAPSED_TIME_FOR_CACHING` | Maximum elapsed time for caching. If you set this parameter, queries that exceed maximum elapsed time return no results, but continue to run in the background until either the query reaches the maximum elapsed time for caching or the query successfully completes and caches the result set. For details, see documentation. | -1 for none, or a positive integer for the number of seconds. |
| `MAX_COLUMNS_IN_RESULT_SET` | Limit number of columns returned by a query. The database process kills queries that exceed this limit. | -1 for unlimited, or a positive integer for the number of columns. |
| `PRIORITY_ADJUSTMENT_FACTOR` | Percentage amount to adjust query priority. You can override this limit at the query level or the session level. Formula is: `(new_priority = current_priority * priority_adjustment_factor)` | 0 to disable dynamic priority adjustment (default), or a positive double value that is greater than 0. Values less than 1 decrease priority over time until the priority reaches the service class minimum priority, while values greater than 1 increase priority over time until the priority reaches the service class maximum priority. |
| `PRIORITY_ADJUSTMENT_TIME` | Time period that indicates the frequency for the adjustment of query priority during execution of the query. You can override this limit at the query level or the session level. | 0 to disable dynamic priority adjustment (default), or a positive integer (unsigned 32-bit integer) for the number of seconds that is greater than 0. |
| `MIN_PRIORITY` | Limit the minimum query priority. The current effective priority cannot be smaller than this value. | 0 (default) or any decimal value (double) greater than 0. |
| `MAX_PRIORITY` | Limit the maximum query priority. The current effective priority cannot be greater than this value. | -1 (default) that indicates infinity or any decimal value (double) greater than 0. |
| `STATEMENT_TEXT` | The system uses the specified service class for any queries that match the specified text pattern. The system uses service classes with statement text before any service classes that lack statement text.<br>If there are multiple service classes with statement text available, the system attempts to match them in alphabetical order. | A string that uses either LIKE or REGEX pattern matching.<br>For example, `STATEMENT_TEXT REGEX ".*my_table.*\|.*your_table.*"` would match any queries that include the strings `my_table` or `your_table`. |

| Parameter | Description | Values |
| --- | --- | --- |
| | This matching allows you to set up service classes so that the system can assign certain query types automatically to higher-priority service classes. | |
| `LOW_LATENCY` | Optional settings that enable you to manage low-latency service classes. | Boolean `true` or `false`, or a Key-Value setting map. |
| `MEMORY_OPTIMAL_STRATEGY` | Direct the Ocient System to reduce query memory usage, even if the operation might increase execution time. Contact Ocient Support when you change this parameter. | Boolean `true` instructs the system to apply stricter scheduling and execution rules to minimize memory consumption and avoid excessive concurrent usage. Otherwise, setting this parameter to `false` instructs the system to disable such strategies, even if the service class default enables them. By default, this parameter is unset. If you leave this parameter unset, the system reverts to higher-level default behavior or other service class settings. |

### Example

This example creates a service class named `sc_name`.

SQL

```
CREATE SERVICE CLASS sc_name
    MAX_TEMP_DISK_USAGE = 80,
    MAX_ELAPSED_TIME = 100,
    MAX_CONCURRENT_QUERIES = 10,
    MAX_ROWS_RETURNED = 100,
    SCHEDULING_PRIORITY = 5.0,
    CACHE_MAX_BYTES = 1000,
    CACHE_MAX_TIME = 25,
    MAX_ELAPSED_TIME_FOR_CACHING = 50;
```

## DROP SERVICE CLASS

Remove an existing service class from the system.

When dropping a service class, you can use the `FORCE` flag to drop a service class and unset it from any dependent groups. If `FORCE` is not used, the function throws an error if there are dependent groups.

### Syntax

```
SQL

DROP SERVICE CLASS sc_name [ IF EXISTS ] [ FORCE ]
```

| Parameter | Data Type | Description |
|---|---|---|
| `sc_name` | string | The identifier of the service class. |

### Example

```
SQL

DROP SERVICE CLASS "my_sc";
```

## ALTER SERVICE CLASS

## ALTER SERVICE CLASS RENAME

Rename a service class.

### Syntax

```
SQL

ALTER SERVICE CLASS [ IF EXISTS ] sc_name RENAME TO new_name
```

| Parameter | Data Type | Description |
|---|---|---|
| `sc_name` | string | The old identifier of the service class. |
| `new_name` | string | The new identifier for the `sc_name` service class. |

### Example

SQL

```
ALTER SERVICE CLASS "my_sc" RENAME TO "my_new_sc";
```

## ALTER SERVICE CLASS SET

Alter a service class with new parameter definitions by using the `SET` keyword.

### Syntax

SQL

```
ALTER SERVICE CLASS [ IF EXISTS ] sc_name
   SET <service_class_definition> [, ...]

<service_class_definition> ::=
  MAX_TEMP_DISK_USAGE [=] percentage |
  MAX_ELAPSED_TIME [=] time |
  MAX_CONCURRENT_QUERIES [=] queries |
  MAX_ROWS_RETURNED [=] rows |
  SCHEDULING_PRIORITY [=] priority |
  CACHE_MAX_BYTES [=] cache_max_bytes |
  CACHE_MAX_TIME [=] cache_max_time |
  MAX_ELAPSED_TIME_FOR_CACHING [=] max_elapsed_time_for_caching |
  MAX_COLUMNS_IN_RESULT_SET [=] max_columns_in_result_set |
  PRIORITY_ADJUSTMENT_FACTOR [=] priority_adjustment_factor |
  PRIORITY_ADJUSTMENT_TIME [=] priority_adjustment_time |
  MIN_PRIORITY [=] priority |
  MAX_PRIORITY [=] priority |
  STATEMENT_TEXT { LIKE | REGEX } [=] statement_text_pattern
```

| Parameter | Data Type | Description |
|---|---|---|
| `sc_name` | string | The identifier of the service class. |

For the service class definition parameters `<service_class_definition>`, see **Define Service Classes**.

### Examples

This example changes the value of `MAX_ROWS_RETURNED` to `51` on the service class named `sc_name`.

SQL

```
ALTER SERVICE CLASS "sc_name" SET MAX_ROWS_RETURNED = 51;
```

This example makes dynamic priority adjustments at the service class level for a priority adjustment time of 15 seconds, priority adjustment factor of 0.75, minimum priority of 2.0, and maximum priority of 5.0.

SQL

```
ALTER SERVICE CLASS "sc_name" SET PRIORITY_ADJUSTMENT_TIME = 15;
ALTER SERVICE CLASS "sc_name" SET PRIORITY_ADJUSTMENT_FACTOR = 0.75;
ALTER SERVICE CLASS "sc_name" SET MIN_PRIORITY = 2.0;
ALTER SERVICE CLASS "sc_name" SET MAX_PRIORITY = 5.0;
```

This example sets the service class `sc_name` to handle queries matching the regular expression `.*my_table.*`.

SQL

```
ALTER SERVICE CLASS "sc_name" SET STATEMENT_TEXT REGEX ".*my_table.*";
```

## ALTER SERVICE CLASS RESET

Alter a service class by restoring default values for one or more specified settings.

### Syntax

SQL

```
ALTER SERVICE CLASS [ IF EXISTS ] sc_name RESET <service_class_definition> [, ...]

<service_class_definition> ::=
  NAME [=] name |
  MAX_TEMP_DISK_USAGE [=] percentage |
  MAX_ELAPSED_TIME [=] time |
  MAX_CONCURRENT_QUERIES [=] queries |
  MAX_ROWS_RETURNED [=] rows |
  SCHEDULING_PRIORITY [=] priority |
  CACHE_MAX_BYTES [=] cache max bytes |
  CACHE_MAX_TIME [=] cache max time |
  MAX_ELAPSED_TIME_FOR_CACHING [=] max elapsed time for caching |
  MAX_COLUMNS_IN_RESULT_SET [=] max columns in result set |
  PRIORITY_ADJUSTMENT_FACTOR [=] priority adjustment factor |
  PRIORITY_ADJUSTMENT_TIME [=] priority adjustment time |
  MIN_PRIORITY [=] priority |
  MAX_PRIORITY [=] priority |
  STATEMENT_TEXT { LIKE | REGEX } [=] statement_text_pattern
```

| Parameter | Data Type | Description |
|---|---|---|
| `sc_name` | string | The identifier of the service class. |

For descriptions of the `<service_class_definition>` parameters, see **Defining Service Classes**.

### Example

This example resets the value of `MAX_ROWS_RETURNED` on the service class named `sc_name`.

SQL

```
ALTER SERVICE CLASS "sc_name" RESET MAX_ROWS_RETURNED;
```

## ALTER QUERY

Set the priority of a SQL query that is running. This priority takes effect immediately. The priority must remain within service class priority limits. The Ocient System overrides other preset priorities for this query, including any existing dynamic priority adjustments.

### Syntax

```
SQL

ALTER QUERY query_id SET PRIORITY [=] priority
```

| Parameter | Data Type | Description |
|---|---|---|
| `query_id` | numeric | The identifier of the SQL query that is running. |
| `priority` | numeric | The priority of the specified SQL query. |

### Example

This example sets the priority of the SQL query `34566` to `2`.

```
SQL

ALTER QUERY 34566 SET PRIORITY 2;
```

# Data Integrity and Storage

How Ocient maintains data integrity at exabyte scale with checksums, segment redundancy, parity, fault tolerance, and storage cluster configuration.

Ocient® provides several capabilities to check on the quality of data on a node and to quarantine segment groups that are problematic for any reason. Also, you can manage pages by converting them to segments. Related to data integrity is the ability to rebuild tasks. For details, see **Distributed Tasks**.

## ALTER SEGMENT QUARANTINE

`ALTER SEGMENT QUARANTINE` isolates segment groups from segment generation or queries. Use this SQL statement if segments are causing unexpected results or crashes. The segments can be un-quarantined by setting `quarantine_level` to `none`.

### Syntax

SQL

```
-- To quarantine a single segment group:
ALTER SEGMENT QUARANTINE FOR { <quarantine_level> }
    WHERE SEGMENT_GROUP_ID = seg_id

-- To quarantine multiple segment groups:
ALTER SEGMENT QUARANTINE FOR { <quarantine_level> }
    WHERE SEGMENT_GROUP_ID in ( seg_id [,...] )

<quarantine_level> ::=
segment_generation | query | all | none
```

| Parameter | Data type | Description |
|---|---|---|
| `seg_id` | numeric | The identification numbers for segment groups. Depending on your `ALTER SEGMENT QUARANTINE` statement, the Ocient System quarantines the specified segment groups for having an existing quarantine removed. For details about finding abnormal segments, see the **Guide to Rebuilding Segments**. |

## Using Quarantine Levels ( `<quarantine_level>` )

You can place quarantines at these segment levels.

| Level | Description |
| --- | --- |
| `segment_generation` | Isolates the specified segments from segment generation.<br>This statement prevents corrupt data from causing problems while still leaving the data available for future analysis. |
| `query` | Isolates segment groups from subsequent queries.<br>Data that is quarantined at the query level is not returned by database queries. This can be useful to prevent corrupt data from causing query problems while leaving it available for future analysis. |
| `all` | Isolates the specified segments from segment generation and subsequent queries. |
| `none` | Removes any quarantines from the specified segments. |

### Examples

This example quarantines a single segment group from `segment_generation`.

SQL

```
ALTER SEGMENT QUARANTINE FOR segment_generation WHERE SEGMENT_GROUP_ID = 123456789;
```

This example quarantines multiple segment groups from `segment_generation`.

SQL

```
ALTER SEGMENT QUARANTINE FOR segment_generation WHERE SEGMENT_GROUP_ID IN (1,2,3,4,
```

This example removes a quarantine from a single-segment group.

SQL

```
ALTER SEGMENT QUARANTINE FOR none WHERE SEGMENT_GROUP_ID = 123456789;
```

This example removes a quarantine from multiple segment groups.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

```sql
ALTER SEGMENT QUARANTINE FOR none WHERE SEGMENT_GROUP_ID IN (1,2,3,4,5);
```

This example quarantines at the `query` level.

```sql
ALTER SEGMENT QUARANTINE FOR query WHERE SEGMENT_GROUP_ID = 123456789;
```

This example removes a quarantine at the `query` level.

```sql
ALTER SEGMENT QUARANTINE FOR none WHERE SEGMENT_GROUP_ID = 123456789;
```

This example quarantines at both the query and segment-group levels.

```sql
ALTER SEGMENT QUARANTINE FOR all WHERE SEGMENT_GROUP_ID = 123456789;
```

## DRAIN PAGES

The `DRAIN PAGES` SQL statement instructs the Ocient System to immediately convert buffered pages into segments on one or more Loader Nodes. During normal operation, the system converts pages to segments automatically based on internal thresholds and timeouts, so the `DRAIN PAGES` statement is usually needed only in special circumstances. For example, draining pages can be useful before performing planned maintenance on Loader Nodes.

The SQL statement targets all Loader Nodes by default. You can optionally scope the operation to a specific storage scope or table, and you can restrict it to a subset of Loader Nodes.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

⚠ The `DRAIN PAGES` statement forces the immediate restructuring of buffered data into durable segments, which can affect system resource utilization and loading performance. Contact Ocient Support before using this SQL statement.

### Required Privileges

- To drain all pages or drain pages for a specific storage scope, you must have `UPDATE` privileges on the system.
- To drain pages for a specific table, you must have `UPDATE` privileges on the system or `DELETE` privileges on the database that contains the table.

### Syntax

SQL

```
DRAIN PAGES
    [ FOR { SCOPE UUID = scope_uuid
          | TABLE UUID = table_uuid } ]
    [ WITH LOADERS loader_name [, loader_name [, ...] ] ]
```

| Parameter | Type | Description |
|---|---|---|
| `scope_uuid` | string | The Universally Unique IDentifier (UUID) of a storage scope. When you specify this value, the system converts only pages that belong to this storage scope. This value is mutually exclusive with the `table_uuid` value. To find storage scope UUIDs, query the **sys.storage_scopes** system catalog table. |
| `table_uuid` | string | The UUID of a table. When you specify this value, the system converts only pages that belong to this table. This value is mutually exclusive with the `scope_uuid` value. To find table UUIDs, query the **sys.tables** system catalog table. |
| `loader_name` | string | The name of a Loader Node. When you specify one or more loader names, the system sends the drain request only to those nodes.<br><br>By default, the system sends the request to all Loader Nodes. |

### Examples

### Drain All Pages

This example converts all buffered pages to segments across every Loader Node.

```
SQL

DRAIN PAGES;
```

### Drain Pages for a Storage Scope

This example converts only pages associated with the storage scope identified by the UUID `a1b2c3d4-e5f6-7890-abcd-ef1234567890`.

```
SQL

DRAIN PAGES
    FOR SCOPE UUID = 'a1b2c3d4-e5f6-7890-abcd-ef1234567890';
```

### Drain Pages for a Table

This example converts only pages associated with the table identified by the UUID `12345678-abcd-ef01-2345-6789abcdef01`.

```
SQL

DRAIN PAGES
    FOR TABLE UUID = '12345678-abcd-ef01-2345-6789abcdef01';
```

### Drain Pages on Specific Loader Nodes

This example sends the drain request to the `loader-node-1` and `loader-node-2` Loader Nodes.

```
SQL

DRAIN PAGES
    WITH LOADERS 'loader-node-1', 'loader-node-2';
```

### Drain Pages for a Table on a Specific Loader Node

This example converts only pages associated with the table identified by the UUID `12345678-abcd-ef01-2345-6789abcdef01` on the `loader-node-1` Loader Node.

SQL

```
DRAIN PAGES
    FOR TABLE UUID = '12345678-abcd-ef01-2345-6789abcdef01'
    WITH LOADERS 'loader-node-1';
```

# Query Analysis

Analyze queries in Ocient using EXPLAIN, system catalog tables, and query profiles to understand execution plans and find opportunities for SQL optimization.

You can analyze queries by commands that instruct Ocient® to return plan-related information for a database administrator or analyst to evaluate. The results of these commands are vital in performance optimization activities on an Ocient System.

Ocient supports SQL DDL commands to terminate running queries and distributed tasks. These commands provide administrative control over query execution and are distinct from programmatic cancellation methods in JDBC and pyocient drivers.

## EXPLAIN

`EXPLAIN` shows the optimized query plan. The database optimizes the query normally, but it does not execute. Instead, the database returns the query plan in the specified format.

### Syntax

SQL

```
EXPLAIN [ PROTO | JSON | DEBUG ] query
```

| Parameter | Data type | Description |
|---|---|---|
| `query` | string | A valid SELECT statement on a database table. |

This table defines the explain plan formats.

| Format | Description |
|---|---|
| PROTO | Includes the same information as the JSON format, but it is presented in a human-readable format. |
| JSON | The default option. Returns the optimized query plan in JSON format. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Format | Description |
| --- | --- |
| DEBUG | The DEBUG format is more compact but does not include some information about each operator. |

### Examples

This example shows the optimized plan for the query `SELECT * FROM names` in JSON format.

SQL

```
EXPLAIN SELECT * FROM names;
```

This EXPLAIN example generates a lengthy output showing the execution plan for the query. This execution plan shows how the database scans the tables referenced by the statement and calculates the memory usage and total execution cost.

This example shows the optimized plan for the query `SELECT * FROM names` in DEBUG format, which produces a more compact execution plan.

SQL

```
EXPLAIN DEBUG SELECT * FROM names;
```

*Output*

Text

```
ROOT_OP @ (0x7eae71515c40), ID: 94921393, md: 2, Out (1): time_x |
  REORDER_OP @ (0x7f4c19ee1c40), ID: 94921392, md: 0, Out (1): time_x | no-op reord
    RENAME_OP @ (0x7f49b1bc2c40), ID: 94921390, md: 2, Out (1): time_x | Old2New: (
      GATHER_OP @ (0x7f49b7886a40), ID: 94921389, md: 2, Out (1): loc.time_x |
        GATHER_OP @ (0x7f49b78866c0), ID: 94921388, md: 2, Out (1): loc.time_x |
          RANDOM_SHUFFLE_OP @ (0x7f486825ba40), ID: 94921394, md: 2, Out (1): loc.t
            INDEX_OP @ (0x7f49b792f040), ID: 94921387, md: 1, Out (1): loc.time_x |
```

# EXPLAIN PIPELINE

`EXPLAIN PIPELINE` shows the pipeline the system uses for compiling a query. The system compiles the pipeline for the specified segments, and if no segment is specified, it picks random segments with the tables.

To explain a pipeline, you must be a system-level user or possess the `SELECT TABLE` privilege for the table used in the query.

### Syntax

SQL

```
-- To show pipeline for a random segment:
EXPLAIN PIPELINE query

-- To show pipeline for a specific segment:
EXPLAIN PIPELINE FOR SEGMENT 'storage_id' ON query

-- To show pipeline for multiple specific segments:
EXPLAIN PIPELINE FOR SEGMENT IN ('storage_id' [, ...]) ON query
```

| Parameter | Data type | Description |
|---|---|---|
| `query` | string | A valid SELECT statement on a database table. |
| `storage_id` | string | A valid segment storage identifier. |

### Examples

This example shows the pipeline on the query `SELECT * FROM names` for a random segment.

SQL

```
EXPLAIN PIPELINE SELECT * FROM names;
```

This example shows the pipeline for the segment with the identifier `529a2e9d-d06c-46cd-a93b-624d3bed1c08`.

```sql
EXPLAIN PIPELINE FOR SEGMENT '529a2e9d-d06c-46cd-a93b-624d3bed1c08'
    ON SELECT * FROM names;
```

This example shows the pipeline for segments with these identifiers: `529a2e9d-d06c-46cd-a93b-624d3bed1c08`, `378eac93-2e3d-4ce6-bf1f-d8b7a78fe585`.

```sql
EXPLAIN PIPELINE FOR SEGMENT IN (
    '529a2e9d-d06c-46cd-a93b-624d3bed1c08',
    '378eac93-2e3d-4ce6-bf1f-d8b7a78fe585')
    ON SELECT * FROM names;
```

All the examples generate lengthy output that includes the execution plan for the query for the specified segments. This execution plan shows how the database scans the tables referenced by the statement and calculates the memory usage and total execution cost.

## PLAN EXECUTE

You can execute a previously generated query plan directly, bypassing the query optimizer. This execution is useful for replaying specific execution plans during performance analysis or debugging.

The Ocient JDBC CLI supports two forms of plan execution:

- `PLAN EXECUTE FILE` — Read the plan from a local file, which is recommended for large plans.
- `PLAN EXECUTE INLINE` — Provide the plan text directly at the command line.

For syntax and usage details, see **PLAN EXECUTE FILE** and **PLAN EXECUTE INLINE**.

# Query Management

Manage queries in Ocient by monitoring active sessions, killing long-running statements, setting resource limits, and reviewing historical query activity.

Query management statements let you monitor and control running queries in an Ocient® System. For information about system tables containing query data, see **Monitoring**.

## CANCEL

Cancels a running query based on its specific query identifier.

The system cancels query execution at the next available pause point, such as between batches of data processing. If the execution of the `CANCEL` SQL statement fails, you can force the query to terminate immediately by using the **KILL** SQL statement.

To view active queries and their identifiers, see the **sys.queries** table.

A `CANCEL` statement can return these statuses.

| Status Message | Description |
|---|---|
| `OK` | The system successfully terminated the query and restored the resources assigned to its execution. |
| `ID_NOT_FOUND` | The specified query identifier does not exist in the system. The missing identifier can indicate that the query finished execution before the system could abort it. |
| `NOT_AUTHORIZED` | The user does not have `UPDATE` privilege for the system level to terminate queries. |
| `NO_CONNECTION` | The system lost connection to the database while trying to terminate the query. |
| `NETWORK_COMMS_ERRO R` | Cannot communicate across the distributed system to terminate the query. |
| `INTERNAL_ERROR` | The system encountered an unexpected error. |

### Required Privileges

Users must have system-level `UPDATE` privileges to cancel queries.

### Syntax

```
SQL

CANCEL [ QUERY ] query_id
```

The `QUERY` keyword is optional and does not change the behavior of the statement.

| Parameter | Type | Description |
|---|---|---|
| `query_id` | string | The Universally Unique IDentifier (UUID) of the query to cancel. Must be a valid UUID string enclosed in single quotes. |

### Examples

Cancel a specific query with the `9a9eb7e3-3440-4814-871f-7f0584ac2fd8` identifier.

```
SQL

CANCEL '9a9eb7e3-3440-4814-871f-7f0584ac2fd8';
```

## KILL

Kills a running query identified by its UUID. This SQL statement performs a forceful termination of the query, aborting execution regardless of its current stage.

If you want to attempt a more gradual query termination that stops processing at the next pause point, use the **CANCEL** SQL statement.

To view active queries and their identifiers, see the **sys.queries** table.

| Status Message | Description |
|---|---|
| `OK` | The system successfully terminated the query and restored the resources assigned to its execution. |
| `ID_NOT_FOUND` | The provided query identifier does not exist in the system. The missing identifier can indicate that the query finished execution before the system |

| Status Message | Description |
| --- | --- |
| | could abort it. |
| `NOT_AUTHORIZED` | The user does not have `UPDATE` privilege for the system level to terminate queries. |
| `NO_CONNECTION` | The system lost connection to the database while trying to terminate the query. |
| `NETWORK_COMMS_ERROR` | Cannot communicate across the distributed system to terminate the query. |
| `INTERNAL_ERROR` | The system encountered an unexpected error. |

### Required Privileges

Users must have system-level `UPDATE` privileges to kill queries.

### Syntax

SQL

```
KILL query_id
```

### Arguments

| Parameter | Type | Description |
| --- | --- | --- |
| `query_id` | String | The UUID of the query to kill. Must be a valid UUID string enclosed in single quotes. |

### Example

Kill a specific query based on the UUID `9a9eb7e3-3440-4814-871f-7f0584ac2fd8`.

SQL

```
KILL '9a9eb7e3-3440-4814-871f-7f0584ac2fd8';
```

# Statistics Cache Management

Manage the Ocient statistics cache to keep query optimizer estimates current, including refresh strategies, cache sizing, and statistics collection options.

System administrators can invalidate internal statistics caches used by the SQL optimizer. The optimizer then immediately sends new requests to Foundation Nodes to repopulate statistics for the underlying data in tables.

The Ocient® System calculates two primary types of statistics. The system calculates Cardinality Distinct Estimates (CDEs) by performing a union operation on the information stored in the table on Foundation Nodes. Also, the system calculates Probability Density Functions (PDFs) by sampling the table data local to the Foundation Node. Then, the system performs a union operation on the CDEs and PDFs on SQL Nodes when stored in the statistics cache. Notably, the union operation for the PDF is not associative, and its implementation is not deterministic. The union operation for the CDE is associative, commutative, and deterministic.

The use of these SQL statements in system administration settings is rare. Do not use these statements for day-to-day maintenance of Ocient clusters. Mostly, you can use these commands when large amounts of data have been loaded or removed from the Ocient System quickly, and the system administrator wants to recalculate statistics immediately rather than wait for the configured statistics cache refresh timer to reflect the changes. These syntaxes help to stabilize the optimizer for new data distributions quickly.

## Invalidate Optimizer Statistics Cache

`INVALIDATE STATS` clears the entire optimizer statistics cache on all SQL Nodes.

If a table has not undergone any row delta after the last statistics cache refresh, the Ocient System does not recalculate statistics by sampling the underlying table. PDF statistics might still change slightly due to non-deterministic union operations. If the table has undergone a row change, the Ocient System recalculates statistics from scratch.

Query performance might be affected until the statistics cache repopulates, specifically for optimization time. For tables that have undergone a row delta, the optimizer temporarily uses the old statistics file again until the recalculated file is available.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

### Syntax

```SQL
INVALIDATE STATS
```

### Example

Clear the entire optimizer statistics cache on all SQL Nodes.

```SQL
INVALIDATE STATS;
```

## Invalidate All Base Statistics

The `INVALIDATE STATS FILES` SQL statement forcibly invalidates the CDE and PDF files of the Foundation Node for all tables regardless of changes in the row delta, which triggers the system to recalculate the statistics.

The optimizer statistics cache continues to use its current value until the Foundation Nodes have finished recalculating the new statistics, after which the cache replaces the table entry with the new statistics. This operation should have minimal impact on query optimization times.

Depending on the size of the system, the system might take minutes to hours to recalculate all statistics on the system fully, and for new statistics to populate in the optimizer cache.

### Syntax

```SQL
INVALIDATE STATS FILES
```

### Example

Invalidate all statistics

```sql
INVALIDATE STATS FILES;
```

## Invalidate All Base Statistics For a Specific Table

The `ALTER table_name INVALIDATE STATS` SQL statement forcibly invalidates the CDE and PDF files of the Foundation Node for the specified table, regardless of changes in the row delta, which triggers the system to recalculate the statistics.

The optimizer statistics cache continues to use its current value until the Foundation Nodes have finished recalculating the new statistics, after which the cache replaces the table entry with the new statistics. This operation should have minimal impact on query optimization times.

### Syntax

```sql
ALTER TABLE table_name INVALIDATE STATS
```

| Parameter | Data Type | Description |
|---|---|---|
| `table_name` | string | The name of the table. |

### Example

Force the system to recalculate the statistics for the table named `test_table`.

```sql
ALTER TABLE test_table INVALIDATE STATS;
```

# Data Flows

Learn how to use data flows in Ocient to execute procedural SQL blocks with variables, control flow, temporary tables, and error handling.

Data flows are procedural control-flow blocks that execute multiple SQL statements sequentially as a single unit in the Ocient® System. You use data flows to build multi-step workflows entirely within the database, eliminating the need for external orchestration tools.

Data flows support two modes.

- Void data flow — Executes statements for side effects such as creating tables, inserting data, or performing cleanup. A void data flow does not return a result set.
- Query data flow — Executes statements and returns a result set using a `RETURN SELECT` statement.

## Use Cases

Data flows are useful for these scenarios:

- **Stage and Transform Data with Data Flows** — Create staging tables, apply transformations across multiple steps, load into final tables, and clean up with the `FINALLY` clause.
- **Build Iterative Queries with Data Flows** — Use `WHILE` loops with the `MAX ITERATIONS` keyword for convergence algorithms, graph traversals, or accumulation patterns.
- **Validate Data Before Loading with Data Flows** — Use `IF`, `ELSEIF`, and `RAISE` keywords as guard clauses to verify data quality before committing a load.

## Syntax

This code block shows the complete syntax for data flows.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

SQL

```
-- Void data flow (no result set)
BEGIN DATAFLOW
    <initial_statement_list>
    [FINALLY <statement_list>]
END DATAFLOW;

-- Query data flow (returns a result set)
BEGIN QUERY DATAFLOW
    [<initial_statement_list>]
    RETURN <select_statement>;
    [FINALLY <statement_list>]
END DATAFLOW;
```

A void data flow requires at least one statement in its body. A query data flow can consist of only a `RETURN SELECT` statement with no preceding statements.

The `<initial_statement_list>` and `<statement_list>` placeholders represent the following elements.

## Initial Statement List ( `<initial_statement_list>` )

Appears at the top level of the data flow body and accepts declarations and flow statements. You can use `DECLARE` statements only in this list, not inside loops, `IF` blocks, or a `FINALLY` clause.

| Element | Description |
|---|---|
| `DECLARE` | Declares a variable with a type and optional initial value. |
| `SET` | Assigns a value to a previously declared variable. |
| `CREATE TABLE #name` | Creates a temporary table scoped to the data flow block. |
| `WHILE` | Repeats statements while a condition is true. |
| `IF` , `ELSEIF` , and `ELSE` | Executes statements conditionally. |
| `FOR` | Iterates using C-style or iterator-style loops. |
| `BREAK` | Exits the innermost enclosing loop. |
| `CONTINUE` | Skips to the next iteration of the innermost loop. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Element | Description |
| --- | --- |
| `RAISE` | Throws a user-defined error and aborts execution. |
| `TRY` and `EXCEPTION WHEN` | Catches errors raised by statements in the `TRY` block. |
| `CALL` | Executes a stored procedure. |
| Any DDL, DML, or DCL statement | For example, `INSERT`, `DELETE`, `CREATE TABLE`, `DROP TABLE`, or `GRANT`. |

## Statement List ( `<statement_list>` )

Appears inside loops, `IF` branches, and `FINALLY` clauses. Supports the same elements as the `<initial_statement_list>` except for the `DECLARE` element.

| Element | Description |
| --- | --- |
| `SET` | Assigns a value to a previously declared variable. |
| `CREATE TABLE #name` | Creates a temporary table scoped to the data flow block. |
| `WHILE` | Repeats statements while a condition is true. |
| `IF`, `ELSEIF`, and `ELSE` | Executes statements conditionally. |
| `FOR` | Iterates using C-style or iterator-style loops. |
| `BREAK` | Exits the innermost enclosing loop. |
| `CONTINUE` | Skips to the next iteration of the innermost loop. |
| `RAISE` | Throws a user-defined error and aborts execution. |
| `TRY` and `EXCEPTION WHEN` | Catches errors raised by statements in the `TRY` block. |
| `CALL` | Executes a stored procedure. |
| Any DDL, DML, or DCL statement | For example, `INSERT`, `DELETE`, `CREATE TABLE`, `DROP TABLE`, or `GRANT`. |

The following table describes other structural elements.

| Element | Description |
| --- | --- |
| `FINALLY` | A clause that always executes after the main body completes, even after an error, that contains its own `<statement_list>`. |

| Element | Description |
| --- | --- |
| `RETURN SELECT` | Returns a result set from a query data flow. Appears only once, after the `<statement_list>` and before `FINALLY`. |

## Temporary Tables

Temporary tables use a `#` prefix in their names, and the database scopes them to the data flow block. The database automatically drops temporary tables when the data flow completes, so you do not need an explicit `DROP TABLE` SQL statement in a `FINALLY` clause.

### Syntax

```sql
CREATE TABLE #table_name (column_definitions);
```

### Example

This example creates a temporary table with the `#` prefix and uses it for intermediate processing. The database drops the temporary table automatically when the data flow completes.

```sql
BEGIN DATAFLOW
    CREATE TABLE #temp (id INT, value DOUBLE);
    INSERT INTO #temp SELECT id, amount FROM raw_data WHERE amount > 0;
    INSERT INTO final_table SELECT * FROM #temp;
END DATAFLOW;
```

## BEGIN DATAFLOW

A void data flow executes one or more statements for their side effects. This data flow does not return a result set.

### Syntax

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

```sql
BEGIN DATAFLOW
    <initial_statement_list>
    [FINALLY <statement_list>]
END DATAFLOW;
```

### Example

This example creates a temporary table (indicated by the `#` prefix), filters and stages data, and loads it into a final table. The database drops the temporary table automatically when the data flow completes.

```sql
BEGIN DATAFLOW
    CREATE TABLE #staging (id INT, amount DOUBLE);
    INSERT INTO #staging SELECT id, amount FROM raw_orders WHERE amount > 0;
    INSERT INTO orders SELECT * FROM #staging;
END DATAFLOW;
```

## BEGIN QUERY DATAFLOW

A query data flow executes statements and returns a result set. The `RETURN SELECT` statement must appear after all other statements and before the optional `FINALLY` clause.

### Syntax

```sql
BEGIN QUERY DATAFLOW
    [<initial_statement_list>]
    RETURN <select_statement>;
    [FINALLY <statement_list>]
END DATAFLOW;
```

### Example

© 2026 Ocient, Inc

This example declares the `total` variable, assigns it the row count from the `orders` table, and returns the result.

```sql
BEGIN QUERY DATAFLOW
    DECLARE @total BIGINT;
    SET @total = (SELECT COUNT(*) FROM orders);
    RETURN SELECT @total;
END DATAFLOW;
```

# DECLARE

Declares a script variable with a specified data type and an optional initial value. You can use `DECLARE` statements only at the top level of the data flow body, not inside loops, `IF` clauses, or `FINALLY` clauses.

### Syntax

```sql
DECLARE @variable_name data_type [NOT NULL] [= expression];
```

### Parameters

| Parameter | Description |
|---|---|
| `@variable_name` | The variable name, prefixed with `@`. |
| `data_type` | The data type for the variable. See **Supported variable data types**. |
| `NOT NULL` | Optional keyword. Requires that the variable always holds a non-NULL value. If you specify `NOT NULL`, you must also provide an initial value using the `= expression` element. |
| `= expression` | Optional expression that sets the initial value. If you omit the expression, the variable uses the default value for its data type. |

### Example

This example declares variables with different data types and initialization options and returns their values. The `counter` variable has the `BIGINT` type and `0` as the default value. The `name` variable has the `VARCHAR` type and `default` as the default string. Also, the `threshold` variable has the `DOUBLE` type and a non-NULL value with `0.95` as the default value.

SQL

```
BEGIN QUERY DATAFLOW
    DECLARE @counter BIGINT = 0;
    DECLARE @name VARCHAR = 'default';
    DECLARE @threshold DOUBLE NOT NULL = 0.95;
    RETURN SELECT @counter, @name, @threshold;
END DATAFLOW;
```

## Supported Variable Data Types

This table lists all data types supported for data flow variables. For details on Ocient data types, see **Data Types**.

| Type | Default Value | Initialization Example |
|---|---|---|
| `BIGINT` | `0` | `DECLARE @v BIGINT = 42` |
| `INT` | `0` | `DECLARE @v INT = 42` |
| `SMALLINT` | `0` | `DECLARE @v SMALLINT = 100` |
| `BYTE` | `0` | `DECLARE @v BYTE = 10` |
| `DOUBLE` | `0.0` | `DECLARE @v DOUBLE = 3.14` |
| `FLOAT` | `0.0` | `DECLARE @v FLOAT = 1.5` |
| `DECIMAL` | Empty | `DECLARE @v DECIMAL(10,2) = 123.45` |
| `BOOLEAN` | `FALSE` | `DECLARE @v BOOLEAN = TRUE` |
| `STRING` | `''` (empty) | `DECLARE @v STRING = 'hello'` |
| `BINARY` | Empty | `DECLARE @v BINARY = BINARY('0xDEADBEEF')` |
| `HASH` | Empty | `DECLARE @v HASH = HASH('0x01020304', 4)` |
| `DATE` | Empty | `DECLARE @v DATE = DATE '2024-01-15'` |
| `TIMESTAMP` | Empty | `DECLARE @v TIMESTAMP = TIMESTAMP '2024-06-15 10:30:00'` |

© 2026 Ocient, Inc

| Type | Default Value | Initialization Example |
| --- | --- | --- |
| `TIME` | Empty | `DECLARE @v TIME = TIME '14:30:00'` |
| `UUID` | Empty | `DECLARE @v UUID = UUID '550e8400-e29b-41d4-a716-446655440000'` |
| `IP` | Empty | `DECLARE @v IP = IP '::1'` |
| `IPV4` | Empty | `DECLARE @v IPV4 = IPV4 '192.168.1.1'` |
| `ST_POINT` | Empty | Using `ST_POINT(x, y)` in queries |
| `ST_LINESTRING` | Empty | Using `ST_LINESTRING('...')` WKT in queries |
| `ST_POLYGON` | Empty | Using `ST_POLYGON('...')` WKT in queries |
| `ARRAY(<type>)` | Uninitialized | `DECLARE @v ARRAY(INT) = ARRAY[1,2,3]` |
| `TUPLE(<types>)` | Uninitialized | `DECLARE @v TUPLE(INT, VARCHAR(100)) = TUPLE(1,'x')` |

Type synonyms: `CHAR` and `VARCHAR` map to `STRING`. `INTEGER` maps to `INT`. `TINYINT` maps to `BYTE`.

Data flow variables do not support the `VARBINARY`, `MATRIX`, and `FUNCTION` data types.

You must initialize container variables (`ARRAY` and `TUPLE`) before use. Referencing an uninitialized container variable in an expression produces a runtime error.

# SET

Assigns a new value to a previously declared variable.

### Syntax

```sql
SET @variable_name = expression;
```

The expression can be a literal, an arithmetic expression, or a scalar subquery.

### Example

This example assigns a variable using an arithmetic expression and then reassigns it using a scalar subquery.

```sql
BEGIN QUERY DATAFLOW
    DECLARE @x BIGINT = 5;
    SET @x = @x + 1;
    SET @x = (SELECT @x * 3);
    RETURN SELECT @x;
END DATAFLOW;
```

Output: `18`

# WHILE

Repeats a block of statements while a condition evaluates to `true`. You can use the optional `MAX ITERATIONS` clause to set an upper bound on the number of iterations.

### Syntax

```sql
WHILE (condition) [MAX ITERATIONS integer] DO
    <statement_list>
END WHILE;
```

### Parameters

| Parameter | Description |
|---|---|
| `condition` | A Boolean expression or a `SELECT` statement that evaluates to a Boolean value. |
| `integer` | Optional. The maximum number of loop iterations. If the loop exceeds this limit, the system throws the `maximum iterations` error. |

### Example

This example uses a `WHILE` loop with the `MAX ITERATIONS` clause to sum integers from one to 10.

SQL

```
BEGIN QUERY DATAFLOW
    DECLARE @i BIGINT = 0;
    DECLARE @sum BIGINT = 0;
    WHILE (@i < 10) MAX ITERATIONS 100 DO
        SET @i = @i + 1;
        SET @sum = @sum + @i;
    END WHILE;
    RETURN SELECT @sum;
END DATAFLOW;
```

## IF, ELSEIF, and ELSE

Executes statements conditionally. The data flow evaluates conditions in order and executes the first matching branch. You can chain zero or more `ELSEIF` clauses. The optional `ELSE` clause executes if no condition matches. Each branch contains a statement list `<statement_list>`.

### Syntax

SQL

```
IF (condition) THEN
    <statement_list>
[ELSEIF (condition) THEN
    <statement_list>]
[ELSE
    <statement_list>]
END IF;
```

### Parameters

| Parameter | Description |
| --- | --- |
| `condition` | A Boolean expression or a `SELECT` statement that evaluates to a Boolean value. |

### Example

This example uses chained `ELSEIF` clauses to map a numeric value to a string label.

```sql
BEGIN QUERY DATAFLOW
    DECLARE @x BIGINT = 2;
    DECLARE @result VARCHAR;
    IF (@x = 1) THEN
        SET @result = 'one';
    ELSEIF (@x = 2) THEN
        SET @result = 'two';
    ELSEIF (@x = 3) THEN
        SET @result = 'three';
    ELSE
        SET @result = 'other';
    END IF;
    RETURN SELECT @result;
END DATAFLOW;
```

Output: `two`

# FOR

Iterates using either C-style or iterator-style syntax. Both styles support the optional `MAX ITERATIONS` clause. The loop body contains a statement list `<statement_list>`.

## C-Style FOR

### Syntax

```sql
FOR (SET @var = init; condition; SET @var = increment) [MAX ITERATIONS integer] DO
    <statement_list>
END FOR;
```

### Parameters

| Parameter | Description |
| --- | --- |
| `@var` | A previously declared variable that the system uses as the loop counter. |
| `init` | An expression that sets the initial value of `@var`. |
| `condition` | A Boolean expression that the system evaluates before each iteration. The loop continues while the condition is `true`. |
| `increment` | An expression that updates `@var` after each iteration. |
| `integer` | Optional. The maximum number of loop iterations. If the loop exceeds this limit, the system throws the `maximum iterations` error. |

The increment statement executes after each iteration, including iterations that execute the `CONTINUE` element.

### Example

This example uses a C-style `FOR` loop to sum integers from one to five.

SQL

```
BEGIN QUERY DATAFLOW
    DECLARE @i BIGINT;
    DECLARE @sum BIGINT = 0;
    FOR (SET @i = 1; @i <= 5; SET @i = @i + 1) MAX ITERATIONS 100 DO
        SET @sum = @sum + @i;
    END FOR;
    RETURN SELECT @sum;
END DATAFLOW;
```

Output: `15`

## Iterator-Style FOR

Iterates over the rows returned by a query. The source query must return exactly one column.

### Syntax

```SQL
FOR @var IN (<select_statement>) [MAX ITERATIONS integer] DO
    <statement_list>
END FOR;
```

### Parameters

| Parameter | Description |
|---|---|
| `@var` | A previously declared variable that receives the value of each row. |
| `<select_statement>` | A query that returns exactly one column. The loop iterates once per row. |
| `integer` | Optional. The maximum number of loop iterations. If the loop exceeds this limit, the system throws the `maximum iterations` error. |

### Example

This example iterates over the rows returned by a query and accumulates a sum.

```SQL
BEGIN QUERY DATAFLOW
    DECLARE @val BIGINT;
    DECLARE @sum BIGINT = 0;
    FOR @val IN (SELECT c1 FROM sys.dummy10) DO
        SET @sum = @sum + @val;
    END FOR;
    RETURN SELECT @sum;
END DATAFLOW;
```

Output: `55`

## BREAK

Immediately exits the innermost enclosing loop ( `WHILE` or `FOR` ). In nested loops, the `BREAK` element exits only the innermost loop. Using the `BREAK` element outside a loop produces a runtime error.

### Syntax

```sql
BREAK;
```

### Example

This example exits a `WHILE` loop early when the counter reaches 3.

```sql
BEGIN QUERY DATAFLOW
    DECLARE @i BIGINT;
    WHILE (true) MAX ITERATIONS 100 DO
        SET @i = @i + 1;
        IF (@i = 3) THEN
            BREAK;
        END IF;
    END WHILE;
    RETURN SELECT @i;
END DATAFLOW;
```

Output: `3`

## CONTINUE

Skips the remainder of the current loop iteration and proceeds to the next iteration. In C-style `FOR` loops, the increment statement still executes before the next condition check. Using the `CONTINUE` element outside a loop produces a runtime error.

### Syntax

```sql
CONTINUE;
```

### Example

This example skips the iteration where `@i` equals 3, so the sum excludes that value.

```sql
BEGIN QUERY DATAFLOW
    DECLARE @i BIGINT = 0;
    DECLARE @sum BIGINT = 0;
    WHILE (@i < 5) MAX ITERATIONS 100 DO
        SET @i = @i + 1;
        IF (@i = 3) THEN
            CONTINUE;
        END IF;
        SET @sum = @sum + @i;
    END WHILE;
    RETURN SELECT @sum;
END DATAFLOW;
```

Output: `12` (1 + 2 + 4 + 5; skips the iteration where @i = 3)

# RAISE

Throws a user-defined error message and aborts the data flow. If the `FINALLY` clause is present, the database executes it before the error propagates.

### Syntax

```sql
RAISE [expression];
```

### Parameters

| Parameter | Description |
|---|---|
| `expression` | Optional. A `VARCHAR` expression containing the error message. If you omit the expression, the system raises a generic error. A NULL or non-string value produces an `INVALID_ARGUMENT` error. |

### Example

This example checks the row count in a staging table and raises an error if the table contains no records.

```SQL
BEGIN DATAFLOW
    DECLARE @count BIGINT = (SELECT COUNT(*) FROM staging_table);
    IF (@count = 0) THEN
        RAISE 'No records found in staging table';
    END IF;
    INSERT INTO target_table SELECT * FROM staging_table;
FINALLY
    DROP TABLE IF EXISTS staging_table;
END DATAFLOW;
```

## TRY and EXCEPTION WHEN

Catches errors raised by statements in a `TRY` element. You define one or more `EXCEPTION WHEN` handlers that match the specific **SQLSTATE code** or all errors using the `OTHERS` string. Inside a handler, the `@SQLERRM` and `@SQLSTATE` variables expose the caught error message and SQLSTATE code. Both the `TRY` body and each handler contain a statement list `<statement_list>`.

### Syntax

```SQL
TRY
    <statement_list>
EXCEPTION WHEN match_spec THEN
    <statement_list>
[EXCEPTION WHEN match_spec THEN
    <statement_list>]
[...]
END TRY;
```

### Parameters

| Parameter | Description |
| --- | --- |
| `match_spec` | Either the `OTHERS` string to catch all errors, or a string literal containing the specific SQLSTATE code (for example, `'22012'`). |

### Example

This example catches any error from an `INSERT` SQL statement and re-raises it.

> `RAISE @SQLERRM` forwards the original error message but not the original SQLSTATE code. The re-raised error uses a generic exception code.

SQL

```
BEGIN DATAFLOW
    TRY
        INSERT INTO target_table SELECT * FROM staging_table;
    EXCEPTION WHEN OTHERS THEN
        RAISE @SQLERRM;
    END TRY;
END DATAFLOW;
```

## FINALLY

Defines a cleanup statement that always executes when the data flow completes, regardless of whether an error occurred. Use the `FINALLY` clause to drop staging tables, release resources, or perform other cleanup operations that must execute even after an error.

### Syntax

SQL

```
BEGIN DATAFLOW
    <statement_list>
FINALLY
    <statement_list>
END DATAFLOW;
```

© 2026 Ocient, Inc

The `FINALLY` clause executes even after a `RAISE` statement or other runtime error.

### Example

This example uses the `FINALLY` clause to ensure that the data flow drops the staging table even if an error occurs during processing. Unlike temporary tables (which the database drops automatically), regular staging tables require explicit cleanup.

SQL

```
BEGIN DATAFLOW
    INSERT INTO final_scores
        SELECT id, score FROM staging_scores WHERE score > 0.5;
FINALLY
    DROP TABLE IF EXISTS staging_scores;
END DATAFLOW;
```

## RETURN

Returns a result set from a query data flow. The `RETURN` clause must appear after all other statements and before the optional `FINALLY` clause. Only query data flows (using `BEGIN QUERY DATAFLOW`) support the `RETURN` clause.

### Syntax

SQL

```
RETURN <select_statement>;
```

### Example

This example filters predictions into the temporary table `#filtered` and returns the result set sorted by the `confidence` column.

SQL

```
BEGIN QUERY DATAFLOW
    DECLARE @threshold DOUBLE = 0.9;
    CREATE TABLE #filtered (id INT, confidence DOUBLE);
    INSERT INTO #filtered SELECT id, confidence FROM predictions WHERE confidence >
    RETURN SELECT * FROM #filtered ORDER BY confidence DESC;
END DATAFLOW;
```

# Stage and Transform Data with Data Flows

Learn how to build a multi-step ELT pipeline using Ocient data flows to stage, transform, and load data within the database.

This tutorial demonstrates how to use Ocient® data flows to build a multi-step extract, load, and transform (ELT) pipeline entirely within the database. You create staging tables, apply transformations across multiple steps, load results into a final table, and clean up temporary resources using a `FINALLY` clause.

Data flows eliminate the need for external orchestration tools by allowing you to execute multiple SQL statements sequentially as a single unit. This approach simplifies pipeline logic, reduces round-trips between the application and database, and ensures cleanup always occurs, even when errors happen.

For details about data flow syntax and supported statements, see **Data Flows**.

## Prerequisites

Before you begin, ensure that you have:

- A running Ocient deployment with access to execute SQL statements.
- The `CREATE TABLE` and `INSERT` privileges on the target schema.

## Prepare the Target Table

For the purposes of this tutorial, assume a source table named `raw_orders` with these columns.

| Column | Type |
|---|---|
| `order_id` | INT |
| `customer_id` | INT |
| `product_id` | INT |
| `quantity` | INT |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column | Type |
| --- | --- |
| `unit_price` | DOUBLE |
| `order_date` | TIMESTAMP |
| `region` | VARCHAR |
| `status` | VARCHAR |

Create the target table that stores the final transformed results. This table holds aggregated order summaries by customer and region.

SQL

```
CREATE TABLE order_summary (
    customer_id INT,
    region VARCHAR,
    total_orders INT,
    total_revenue DOUBLE,
    avg_order_value DOUBLE,
    last_order_date TIMESTAMP
);
```

## Build and Execute the ELT Pipeline

### 1 Build the Data Flow

Create a void data flow that stages raw data, applies transformations, and loads the results into the target table. The data flow performs these operations:

1. Creates a temporary staging table `#valid_orders` to hold filtered records.
2. Creates a temporary aggregation table `#customer_agg` to hold computed summaries.
3. Filters out canceled orders and inserts valid records into the staging table.
4. Computes aggregated metrics per customer and region.
5. Loads the aggregated results into the final `order_summary` table.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

SQL

```sql
BEGIN DATAFLOW
    -- Create temporary tables for staging and aggregation
    CREATE TABLE #valid_orders (
        order_id INT,
        customer_id INT,
        product_id INT,
        quantity INT,
        unit_price DOUBLE,
        order_date TIMESTAMP,
        region VARCHAR
    );

    CREATE TABLE #customer_agg (
        customer_id INT,
        region VARCHAR,
        total_orders INT,
        total_revenue DOUBLE,
        avg_order_value DOUBLE,
        last_order_date TIMESTAMP
    );

    -- Filter out canceled orders into staging
    INSERT INTO #valid_orders
        SELECT order_id, customer_id, product_id, quantity, unit_price, order
        FROM raw_orders
        WHERE status <> 'canceled';

    -- Compute aggregated metrics per customer and region
    INSERT INTO #customer_agg
        SELECT
            customer_id,
            region,
            COUNT(*) AS total_orders,
            SUM(quantity * unit_price) AS total_revenue,
            SUM(quantity * unit_price) / COUNT(*) AS avg_order_value,
            MAX(order_date) AS last_order_date
        FROM #valid_orders
        GROUP BY customer_id, region;

    -- Load aggregated results into the final table
    INSERT INTO order_summary
        SELECT * FROM #customer_agg;
```

```
END DATAFLOW;
```

Temporary tables use the `#` prefix and the database scopes them to the data flow block. The system drops them automatically when the data flow completes.

### 2 Verify the Results

Query the target table to verify that the data loaded correctly.

SQL

```
SELECT * FROM order_summary ORDER BY total_revenue DESC LIMIT 10;
```

### 3 Add Error Handling

Optionally, you can wrap the transformation steps in the `TRY` and `EXCEPTION WHEN` element to catch and handle errors gracefully. This example logs the error for diagnostics, then re-raises it so the data flow still aborts on failure.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

SQL

```sql
BEGIN DATAFLOW
    CREATE TABLE #valid_orders (
        order_id INT,
        customer_id INT,
        quantity INT,
        unit_price DOUBLE,
        order_date TIMESTAMP,
        region VARCHAR
    );

    TRY
        INSERT INTO #valid_orders
            SELECT order_id, customer_id, quantity, unit_price, order_date, r
            FROM raw_orders
            WHERE status <> 'canceled';

        INSERT INTO order_summary
            SELECT
                customer_id,
                region,
                COUNT(*),
                SUM(quantity * unit_price),
                SUM(quantity * unit_price) / COUNT(*),
                MAX(order_date)
            FROM #valid_orders
            GROUP BY customer_id, region;
    EXCEPTION WHEN OTHERS THEN
        -- Log the error for diagnostics, then re-raise to abort the data flo
        INSERT INTO error_log VALUES (CURRENT_TIMESTAMP, @SQLERRM, @SQLSTATE)
        RAISE @SQLERRM;
    END TRY;

END DATAFLOW;
```

# Validate Data Before Loading with Data Flows

Learn how to use Ocient data flows to validate data quality before committing a load, using IF, ELSEIF, and RAISE as guard clauses.

This tutorial demonstrates how to use Ocient® data flows to validate data quality before committing a load into production tables. You use conditional logic as guard clauses to verify that source data meets your requirements, and abort the load with a clear error message if any check fails.

This pattern is useful for extract, load, and transform (ELT) workflows where bad data can cause downstream issues. By validating within the data flow, you ensure that either all checks pass and the load completes, or the data flow cleanly aborts the load, and the `FINALLY` clause cleans up temporary resources.

For details about data flow syntax and supported statements, see **Data Flows**.

## Prerequisites

Before you begin, ensure that you have:

- A running Ocient deployment with access to execute SQL statements.
- The `CREATE TABLE` and `INSERT` privileges on the target schema.

## Prepare the Target Table

For the purposes of this tutorial, assume a source staging table named `staged_events` with these columns.

| Column | Type |
|---|---|
| `event_id` | INT |
| `user_id` | INT |
| `event_type` | VARCHAR |
| `event_time` | TIMESTAMP |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column | Type |
| --- | --- |
| `payload_size` | INT |

Create the target table that receives validated data.

SQL

```
CREATE TABLE events (
    event_id INT,
    user_id INT,
    event_type VARCHAR,
    event_time TIMESTAMP,
    payload_size INT
);
```

# Build and Execute the Validation Pipeline

### 1 Understand the Validation Checks

Before building the data flow, define the validation rules that the source data must satisfy. This example enforces three rules:

- Row count check — The staging table must contain at least one row.
- NULL check — No rows can have a NULL `user_id` column value.
- Value range check — No rows can have a `payload_size` column value exceeding 10,000,000 bytes.

If any check fails, the data flow raises a descriptive error and does not load any data into the target table.

### 2 Build the Validation Data Flow

Create a void data flow that executes each validation check in sequence. If all checks pass, the data flow loads the staged data into the production table.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

SQL

```sql
BEGIN DATAFLOW
    DECLARE @row_count BIGINT;
    DECLARE @null_count BIGINT;
    DECLARE @oversized_count BIGINT;

    -- Check 1: Verify the staging table is not empty
    SET @row_count = (SELECT COUNT(*) FROM staged_events);
    IF (@row_count = 0) THEN
        RAISE 'Validation failed: staged_events contains no rows';
    END IF;

    -- Check 2: Verify no NULL user identifiers
    SET @null_count = (SELECT COUNT(*) FROM staged_events WHERE user_id IS NU
    IF (@null_count > 0) THEN
        RAISE 'Validation failed: ' || CAST(@null_count AS VARCHAR) || ' rows
    END IF;

    -- Check 3: Verify payload sizes are within limits
    SET @oversized_count = (
        SELECT COUNT(*) FROM staged_events WHERE payload_size > 10000000
    );
    IF (@oversized_count > 0) THEN
        RAISE 'Validation failed: ' || CAST(@oversized_count AS VARCHAR) || '
    END IF;

    -- All checks passed — load the data
    INSERT INTO events
        SELECT * FROM staged_events;

FINALLY
    DROP TABLE IF EXISTS staged_events;
END DATAFLOW;
```

If any `RAISE` statement executes, the data flow aborts immediately and does not insert any data into the `events` table. The `FINALLY` clause still executes, dropping the staging table regardless of whether the load succeeded or failed.

### 3 Use Multiple Severity Levels with the `ELSEIF` Element

You can use the `ELSEIF` element to implement tiered validation where different conditions produce different error messages or take different actions. This example checks row count thresholds and raises warnings at different levels.

SQL

```
BEGIN DATAFLOW
    DECLARE @row_count BIGINT;

    SET @row_count = (SELECT COUNT(*) FROM staged_events);

    IF (@row_count = 0) THEN
        RAISE 'Validation failed: no rows in staged_events';
    ELSEIF (@row_count < 100) THEN
        RAISE 'Validation failed: only ' || CAST(@row_count AS VARCHAR) || ' :
    ELSEIF (@row_count > 10000000) THEN
        RAISE 'Validation failed: ' || CAST(@row_count AS VARCHAR) || ' rows (
    END IF;

    -- Checks passed — proceed with the load
    INSERT INTO events
        SELECT * FROM staged_events;

FINALLY
    DROP TABLE IF EXISTS staged_events;
END DATAFLOW;
```

## 4 Combine Validation with Error Handling

You can wrap the entire validation and load sequence in the `TRY` and `EXCEPTION WHEN` elements to catch unexpected errors. This example logs the error for diagnostics, then re-raises it so the data flow still aborts on failure.

```sql
BEGIN DATAFLOW
    DECLARE @row_count BIGINT;

    TRY
        SET @row_count = (SELECT COUNT(*) FROM staged_events);

        IF (@row_count = 0) THEN
            RAISE 'Validation failed: staged_events contains no rows';
        END IF;

        INSERT INTO events
            SELECT * FROM staged_events;

    EXCEPTION WHEN OTHERS THEN
        -- Log the error for diagnostics, then re-raise to abort the data flo
        INSERT INTO error_log VALUES (CURRENT_TIMESTAMP, @SQLERRM, @SQLSTATE)
        RAISE @SQLERRM;
    END TRY;

FINALLY
    DROP TABLE IF EXISTS staged_events;
END DATAFLOW;
```

The `@SQLERRM` variable contains the error message from the caught exception, including the message from any `RAISE` statement. The `@SQLSTATE` variable contains the corresponding **SQLSTATE code**.

# Build Iterative Queries with Data Flows

Learn how to use Ocient data flows to execute iterative computations such as accumulation patterns, graph traversals, and convergence algorithms.

The examples demonstrate how to use Ocient® data flows to execute iterative computations within the database. You use `WHILE` and `FOR` loops to implement patterns such as accumulation, graph traversal, and convergence algorithms.

Data flows provide loop constructs that are especially useful when a computation requires repeated passes over data, such as propagating values through a graph or refining an estimate until it stabilizes. The `RETURN SELECT` statement in a query data flow returns the final result set to the caller.

For details about data flow syntax and supported statements, see **Data Flows**.

## Prerequisites

Before you begin, ensure that you have:

- A running Ocient deployment with access to execute SQL statements.
- The `CREATE TABLE` and `INSERT` privileges on the target schema.

## Accumulation with a `WHILE` Loop Example

This example computes a running factorial using a `WHILE` loop. The example demonstrates the basic loop pattern with variable manipulation and a safety limit.

### 1 Execute the Query Data Flow

Execute this query data flow to compute the factorial of 10. The `MAX ITERATIONS` clause acts as a safety limit to prevent infinite loops if the loop never satisfies the termination condition.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

```sql
BEGIN QUERY DATAFLOW
    DECLARE @n BIGINT = 10;
    DECLARE @i BIGINT = 1;
    DECLARE @result BIGINT = 1;

    WHILE (@i <= @n) MAX ITERATIONS 100 DO
        SET @result = @result * @i;
        SET @i = @i + 1;
    END WHILE;

    RETURN SELECT @result AS factorial;
END DATAFLOW;
```

This data flow returns a single row containing the factorial of 10 (3628800).

## Graph Traversal with Iterative Expansion Example

This example finds all nodes reachable from a starting node in a directed graph by iteratively expanding the frontier of discovered nodes. Each iteration discovers new neighbors and adds them to the set of reached nodes.

### 1 Create the Graph Table

Create a table representing a directed graph with edges between nodes.

```sql
CREATE TABLE edges (
    src INT,
    dst INT
);
```

### 2 Insert Sample Data

© 2026 Ocient, Inc

Insert edges representing a simple directed graph.

SQL

```
INSERT INTO edges VALUES
    (1, 2), (1, 3), (2, 4), (3, 4),
    (4, 5), (5, 6), (6, 7), (7, 8),
    (10, 11), (11, 12);
```

### 3 Execute the Traversal Data Flow

Execute this query data flow to find all nodes reachable from node 1.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

SQL

```
BEGIN QUERY DATAFLOW
    DECLARE @start_node INT = 1;
    DECLARE @prev_count BIGINT = 0;
    DECLARE @curr_count BIGINT = 0;

    -- Initialize the reached set with the starting node
    CREATE TABLE #reached (node_id INT);
    INSERT INTO #reached VALUES (@start_node);

    -- Iteratively expand the frontier
    WHILE (true) MAX ITERATIONS 100 DO
        -- Add newly discovered neighbors
        INSERT INTO #reached
            SELECT DISTINCT e.dst
            FROM edges e
            INNER JOIN #reached r ON e.src = r.node_id
            WHERE e.dst NOT IN (SELECT node_id FROM #reached);

        -- Check if the set grew
        SET @curr_count = (SELECT COUNT(*) FROM #reached);
        IF (@curr_count = @prev_count) THEN
            BREAK;
        END IF;
        SET @prev_count = @curr_count;
    END WHILE;

    RETURN SELECT node_id FROM #reached ORDER BY node_id;
END DATAFLOW;
```

This data flow returns all nodes reachable from node 1: 1, 2, 3, 4, 5, 6, 7, and 8. Nodes 10, 11, and 12 are not reachable from node 1 and do not appear in the results.

## Convergence Algorithm Example

This example implements an iterative averaging algorithm that converges to a stable value. Each iteration computes the average of the current value and a target, stopping

when the change between iterations falls below a threshold.

### 1 Execute the Convergence Data Flow

Execute this query data flow to iterate until the value converges.

SQL

```
BEGIN QUERY DATAFLOW
    DECLARE @value DOUBLE = 100.0;
    DECLARE @target DOUBLE = 42.0;
    DECLARE @threshold DOUBLE = 0.001;
    DECLARE @prev_value DOUBLE = 0.0;
    DECLARE @iterations BIGINT = 0;

    WHILE (true) MAX ITERATIONS 1000 DO
        SET @prev_value = @value;
        SET @value = (@value + @target) / 2.0;
        SET @iterations = @iterations + 1;

        IF ABS(@value - @prev_value) < @threshold THEN
            BREAK;
        END IF;
    END WHILE;

    RETURN SELECT @value AS converged_value, @iterations AS iterations;
END DATAFLOW;
```

Output: `42.0009, 16` (converged value and iteration count)

## Iterator-Style FOR Loop Example

This example uses an iterator-style `FOR` loop to iterate over query results and accumulate a sum.

### 1 Execute the Iterator Data Flow

Execute this query data flow to sum values from a query result.

```sql
BEGIN QUERY DATAFLOW
    DECLARE @val BIGINT;
    DECLARE @total BIGINT = 0;

    FOR @val IN (SELECT c1 FROM sys.dummy10) DO
        SET @total = @total + @val;
    END FOR;

    RETURN SELECT @total AS row_sum;
END DATAFLOW;
```

Output: `55`

The iterator-style `FOR` loop executes once per row returned by the `SELECT` statement. The source query must return exactly one column.

**Data Query Language (DQL) Statement Reference**

© 2026 Ocient All Rights Reserved Terms Of Use Privacy Statement

# Data Control Language (DCL) Statement Reference

Reference for Ocient Data Control Language (DCL) statements, including GRANT and REVOKE for managing privileges, roles, and access in the database.

In order to assign privileges to users, administrators can use Data Control Language (DCL) statements. You can write and execute DCL statements like any other SQL statements against the Ocient® System and databases. DCL statements allow you to quickly and easily grant or revoke privileges from users. DCL statements work off two main concepts: Grants and Revokes. Statements that begin with `GRANT` give the associated privileges to a user or group. Statements that begin with `REVOKE` remove those privileges from a user or group.

A full list of privileges can be found in the **Ocient Privileges Reference**.

Supported DCL SQL statements are:

- GRANT PRIVILEGE
- REVOKE PRIVILEGE
- GRANT ROLE
- REVOKE ROLE
- **GET NODE TOKEN**
- **REVOKE NODE TOKEN**

When you create an object in the system, database, or schema, the Ocient System automatically grants you all valid privileges for that type of object. For example, if you create a table in a database, the system grants you all privileges that apply to the created table. For details, see **Table Privileges**.

For non-SSO users, the system assigns creator privileges to the user. For SSO users, the system follows specific criteria to assign the privileges. To understand the criteria the system uses, see **User Access Control and Workload Management with SSO**.

## Grant Privileges

The `GRANT` statement grants privileges to a user or group. The privileges that you can grant in the `GRANT` statement map to the tables and differ per object. The `WITH GRANT OPTION` keywords specify that the grantee can also grant privileges on that object.

To grant privileges, you must have:

- `VIEW` privileges for the specified user or group being granted new privileges.
- `SYSAUTH` privileges over the system or database object that the specified user or group is being granted privileges on.

**Syntax**

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

SQL

```
GRANT {
    { CREATE { <systemObjects> }
        | VIEW { SCHEMA | TABLE | VIEW | QUERIES | REDACTED QUERIES }
        | ALTER { SCHEMA | TABLE | VIEW }
        | DROP { SCHEMA | TABLE | VIEW }
        | CANCEL QUERIES
        | SELECT | DELETE | SYSAUTH | USE | ALL }
        ON SYSTEM
    | { CREATE { <databaseObjects> }
        | VIEW { SCHEMA | TABLE | VIEW  | QUERIES | REDACTED QUERIES }
        | ALTER { SCHEMA | TABLE | VIEW }
        | DROP { SCHEMA | TABLE | VIEW }
        | CANCEL QUERIES
        | SELECT | ALTER | DROP | DELETE | SYSAUTH | USE | ALL }
        ON DATABASE object_name
    | { CREATE { <schemaObjects> | MLMODEL } | VIEW { <schemaObjects> }
        | ALTER { <schemaObjects> }
        | DROP { <schemaObjects> }
        | VIEW | SELECT | ALTER | DROP | DELETE | SYSAUTH | INSERT | ALL }
        ON SCHEMA object_name
    | { USE | VIEW | ALL }
        ON SERVICE CLASS object_name
    | { VIEW | ALTER | DROP | SYSAUTH | ALL }
        ON { GROUP | USER } object_name
    | { SELECT | DROP | SYSAUTH | ALL }
        ON MLMODEL object_name
    | { VIEW | EXECUTE | ALTER | DROP | SYSAUTH | ALL }
        ON PIPELINE object_name
    | { VIEW | DROP | SYSAUTH | ALL }
        ON PIPELINE FUNCTION object_name
    | { VIEW | EXECUTE | DROP | SYSAUTH | ALL }
        ON MCP TOOL object_name
    | { VIEW | SELECT | ALTER | DROP | SYSAUTH | ALL }
        ON VIEW object_name
    | { VIEW | SELECT | ALTER | LOAD | DROP | DELETE | SYSAUTH | INSERT | ALL }
        ON TABLE object_name
    | { VIEW | SELECT | ALL }
        ON TABLE sys.system_catalog_table
 }
    TO { { GROUP | USER } object_name | PUBLIC } [ WITH GRANT OPTION ]

<systemObjects> ::=
```

```
    DATABASE | TABLE | VIEW | USER | GROUP
<databaseObjects> ::=
    SCHEMA | TABLE | VIEW | MLMODEL | PIPELINE | PIPELINE FUNCTION
    | MCP TOOL | USER | GROUP
<schemaObjects> ::=
    TABLE | VIEW
```

When you grant any privilege to a user on a system or database object other than the `VIEW` privilege, the database implicitly grants the `VIEW` privilege on the specified object to the user, as well as associated object types (e.g., `DROP VIEW ON DATABASE` also grants `VIEW VIEW ON DATABASE` and `VIEW ON DATABASE`).

### Examples

#### Grant Privilege on a Table

This example grants privileges for the `SELECT` SQL statement on a table to a trusted group.

SQL

```
GRANT SELECT ON TABLE company_data TO GROUP trusted_employees;
```

#### Grant Privilege on a Database

This example grants the `SELECT` privilege for all tables and views on the `database_name` database to a trusted group.

SQL

```
GRANT SELECT ON DATABASE database_name TO GROUP trusted_employees;
```

#### Grant Privilege on the System

This example grants the `SELECT` privilege for all tables and views on all databases in the system to a trusted group.

```sql
GRANT SELECT ON SYSTEM TO GROUP trusted_employees;
```

### Grant Privilege on a Service Class

This example grants the `USE` privilege on a service class to a user. The user can then reference the service class in the `USING SERVICE CLASS` query clause.

```sql
GRANT USE ON SERVICE CLASS "analytics_sc" TO USER "analyst1@mydb";
```

For examples of granting privileges for individual users, see **Grant Role Membership**.

## Revoke Privileges

The `REVOKE` statement revokes privileges from a user or group.

To revoke privileges, you must have:

- `VIEW` privileges for the specified user or group having their privileges revoked.
- `SYSAUTH` privileges over the system or database object from which the specified user or group has their privileges revoked.

SQL

```
REVOKE [ GRANT OPTION FOR ] {
    { CREATE { <systemObjects> }
        | VIEW { SCHEMA | TABLE | VIEW | QUERIES | REDACTED QUERIES }
        | ALTER { SCHEMA | TABLE | VIEW }
        | DROP { SCHEMA | TABLE | VIEW }
        | CANCEL QUERIES
        | SELECT | DELETE | SYSAUTH | USE | ALL }
        ON SYSTEM
    | { CREATE { <databaseObjects> }
        | VIEW { SCHEMA | TABLE | VIEW | QUERIES | REDACTED QUERIES }
        | ALTER { SCHEMA | TABLE | VIEW }
        | DROP { SCHEMA | TABLE | VIEW }
        | CANCEL QUERIES
        | SELECT | ALTER | DROP | DELETE | SYSAUTH | USE | ALL }
        ON DATABASE object_name
    | { CREATE { <schemaObjects> | MLMODEL } | VIEW { <schemaObjects> }
        | ALTER { <schemaObjects> }
        | DROP { <schemaObjects> }
        | VIEW | SELECT | ALTER | DROP | DELETE | SYSAUTH | INSERT | ALL }
        ON SCHEMA object_name
    | { USE | VIEW | ALL }
        ON SERVICE CLASS object_name
    | { VIEW | ALTER | DROP | SYSAUTH | ALL }
        ON { GROUP | USER } object_name
    | { SELECT | DROP | SYSAUTH | ALL }
        ON MLMODEL object_name
    | { VIEW | EXECUTE | ALTER | DROP | SYSAUTH | ALL }
        ON PIPELINE object_name
    | { VIEW | DROP | SYSAUTH | ALL }
        ON PIPELINE FUNCTION object_name
    | { VIEW | EXECUTE | DROP | SYSAUTH | ALL }
        ON MCP TOOL object_name
    | { VIEW | SELECT | ALTER | DROP | SYSAUTH | ALL }
        ON VIEW object_name
    | { VIEW | SELECT | ALTER | LOAD | DROP | DELETE
        | SYSAUTH | INSERT | ALL }
        ON TABLE object_name
    | { VIEW | SELECT | ALL }
        ON TABLE sys.system_catalog_table
  }
    FROM { [ USER | GROUP ] object_name | PUBLIC }
```

```
<systemObjects> ::=
    DATABASE | TABLE | VIEW | USER | GROUP
<databaseObjects> ::=
    SCHEMA | TABLE | VIEW | MLMODEL | PIPELINE | PIPELINE FUNCTION
    | MCP TOOL | USER | GROUP
<schemaObjects> ::=
    TABLE | VIEW
```

When you revoke the `VIEW` privilege on a system or database object, the database implicitly revokes all privileges on the specified object from the user.

If you revoke the `VIEW` privilege on an associated object type, the system revokes the privileges for that object type. For example, grant the `DROP TABLE` privilege to the user by using the `GRANT DROP TABLE ON DATABASE` SQL statement. Due to implicit granting by the system, this action causes the user to have `DROP TABLE`, `VIEW TABLE`, and `VIEW` privileges. If you revoke the `VIEW TABLE` privilege using the `REVOKE VIEW TABLE ON DATABASE` SQL statement, then the system revokes the privileges for the associated type. In this case, the user only retains the `VIEW` privilege on the database.

## Examples

### Revoke Privilege on a Table

This example revokes the `SELECT` privilege on a table from an untrusted group.

SQL

```
REVOKE SELECT ON TABLE company_data FROM GROUP untrusted;
```

### Revoke Privilege on a Database

This example revokes the `SELECT` privilege for all tables and views on the `database_name` database from an untrusted group.

SQL

```
REVOKE SELECT ON DATABASE database_name FROM GROUP untrusted;
```

### Revoke Privilege on the System

This example revokes the `SELECT` privilege for all tables and views on all databases in the system from an untrusted group.

```sql
REVOKE SELECT ON SYSTEM FROM GROUP untrusted;
```

### Revoke Privilege on a Service Class

This example revokes the `USE` privilege on a service class from a user.

```sql
REVOKE USE ON SERVICE CLASS "analytics_sc" FROM USER "analyst1@mydb";
```

For examples of revoking privileges for individual users, see **Revoking Role Membership**.

## Ocient Privileges Reference

These tables describe the privilege options on each object in Ocient and the allowed privileges.

> As of version 23.0, Ocient DCL has replaced the `TRUNCATE` privilege with the `DELETE` privilege.
>
> Any `TRUNCATE` privileges, whether manually granted or assigned as part of a user role, should automatically convert to `DELETE` privileges following a system upgrade to version 23.0 or later.

### Ocient System Privileges

| Privilege | Description |
|---|---|
| CREATE [DATABASE, USER, GROUP] | The privilege to create the specified object type. On creation, the creating user inherits all privileges on the object. In the case of the DATABASE object, this is enforced by granting the creating user the newly created database administrator role as described in the Roles section. |
| CREATE [SCHEMA, TABLE, VIEW] | The privilege to create the specified object type on any database where the user can connect. On creation, the creating user inherits all privileges on the |

| Privilege | Description |
| --- | --- |
| | object. In order to apply the privilege, the user has to be connected to a user-defined database. |
| DROP [SCHEMA, TABLE, VIEW] | The privilege to drop the specified object type on any database where the user can connect. In order to apply the privilege, the user has to be connected to a user-defined database. |
| ALTER [SCHEMA, TABLE, VIEW] | The privilege to modify the specified object type on any database where the user can connect. In order to apply the privilege, the user has to be connected to a user-defined database. |
| VIEW [SCHEMA, TABLE, VIEW] | The privilege to see and read information of the specified object type within the system. |
| VIEW QUERIES | The privilege to see the full SQL statement and metadata for all queries within the system. |
| VIEW REDACTED QUERIES | The privilege to see the metadata for all queries with a fully redacted SQL statement within the system. |
| CANCEL QUERIES | The privilege to cancel or kill running queries within the system. |
| SELECT | The privilege to read data on any table or view where the user has the VIEW privilege. |
| SYSAUTH | The privilege to grant and revoke all privileges on the system. |
| USE | The ability to connect to the system. |
| DELETE | The privilege to delete data from and truncate tables within the system. |

## Database Privileges

| Privilege | Description |
| --- | --- |
| CREATE [SCHEMA, TABLE, VIEW, MLMODEL, PIPELINE, PIPELINE FUNCTION, MCP TOOL, USER, GROUP] | The privilege to create the specified object type. The user who creates the object inherits all privileges on the object. |
| DROP [SCHEMA, TABLE, VIEW] | The privilege to drop the specified object type on this database. |
| ALTER [SCHEMA, TABLE, VIEW] | The privilege to modify the specified object type on this database. |
| VIEW [SCHEMA, TABLE, VIEW] | The privilege to see and read information of the specified object type within the database. |
| VIEW QUERIES | The privilege to see the full SQL statement and metadata for all queries in this database. |

| Privilege | Description |
| --- | --- |
| VIEW REDACTED QUERIES | The privilege to see the metadata for all queries with a fully redacted SQL statement in this database. |
| CANCEL QUERIES | The privilege to cancel or kill running queries in this database. |
| SELECT | The privilege to read data on any table or view, where the user has the VIEW privilege, in the database. |
| USE | Ability to connect to the database. Users created in this database are implicitly granted this privilege. |
| ALTER | The ability to issue ALTER DATABASE statements on this database. |
| DROP | The ability to drop this database. |
| SYSAUTH | The ability to grant and revoke all privileges on the database. |
| DELETE | The privilege to delete data from and truncate tables in the database. |

## Schema Privileges

| Privilege | Description |
| --- | --- |
| CREATE [ TABLE \| VIEW \| MLMODEL ] | The privilege to create the specified object type. |
| DROP [ TABLE \| VIEW ] | The privilege to drop the specified object type within the schema. |
| ALTER [ TABLE \| VIEW ] | The privilege to modify the specified object type within the schema. |
| VIEW [ TABLE \| VIEW ] | The privilege to see and read information of the specified object type within the schema. |
| SELECT | The privilege to read data on any table or view, where the user has the VIEW privilege, within the schema. |
| ALTER | The ability to modify the schema. |
| DROP | The privilege to drop the schema and its contents. |
| VIEW | The ability to see and read information about the schema. |
| SYSAUTH | The ability to grant and revoke all privileges on the schema. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Privilege | Description |
| --- | --- |
| INSERT | The privilege to insert data into tables in the schema. |
| DELETE | The privilege to delete data from and truncate tables in the schema. |

Granting privileges using DCL statements promotes an implicit schema to an explicit schema. For details, see **Schemas**.

## Service Class Privileges

| Privilege | Description |
| --- | --- |
| USE | Ability to reference the service class in the `USING SERVICE CLASS` query clause. |
| VIEW | Ability to see the service class in the `sys.service_classes` system catalog table. The system implicitly grants the `VIEW` privilege when it grants the `USE` privilege. |

Only `USE` and `VIEW` are valid privileges for service classes. Attempting to grant other privileges on a service class returns an error.

Granting `USE` does not affect automatic service class routing. The system never automatically selects a service class that is available only through a `USE` grant (and not through a group assignment). The `USE` privilege applies exclusively to the explicit `USING SERVICE CLASS` clause in a query.

## View Privileges

| Privilege | Description |
| --- | --- |
| VIEW | Ability to see and read schema information about the view. |
| SELECT | Ability to read data from the view. |
| ALTER | Ability to modify the view. |
| DROP | Ability to drop the view. |
| SYSAUTH | Ability to grant privileges on the view. |

## Table Privileges

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Privilege | Description |
| --- | --- |
| VIEW | Ability to see and read schema information about the table. |
| SELECT | Ability to read data from the table. |
| ALTER | Ability to modify the table. |
| LOAD | Ability to load data into the table. |
| DROP | Ability to drop the table. |
| DELETE | Ability to delete and truncate the table. |
| SYSAUTH | Ability to grant and revoke privileges on the table. |
| INSERT | Ability to insert data into the table. |

## Machine Learning Model Privileges

| Privilege | Description |
| --- | --- |
| ALTER | Ability to rename the model. |
| SELECT | Ability to read data and descriptive data from the model. |
| DROP | Ability to drop the model. |
| SYSAUTH | Ability to grant and revoke privileges on the model. |

## Data Pipeline Privileges

| Privilege | Description |
| --- | --- |
| VIEW | See and read information schema about a pipeline. |
| EXECUTE | Start and stop the execution of a pipeline. |
| ALTER | Rename and replace a pipeline. |
| DROP | Drop a pipeline. |
| SYSAUTH | Grant and revoke privileges on a pipeline. |

## Data Pipeline Function Privileges

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Privilege | Description |
| --- | --- |
| VIEW | See and read information schema about a data pipeline function in the system catalog tables. |
| DROP | Drop a data pipeline function. |
| SYSAUTH | Grant and revoke privileges on a data pipeline function. |

## Model Context Protocol Tool Privileges

The `CREATE MCP TOOL` privilege is a system-level or database-level privilege that grants the ability to create Model Context Protocol (MCP) tools. The user who creates a tool inherits all privileges on the tool. The following privileges apply to an individual MCP tool.

| Privilege | Description |
| --- | --- |
| VIEW | See and read information about an MCP tool in the system catalog tables. |
| EXECUTE | Call an MCP tool with the `CALL MCP TOOL` SQL statement. |
| DROP | Drop an MCP tool. |
| SYSAUTH | Grant and revoke privileges on an MCP tool. |

System MCP tools are always visible to every user and cannot be dropped. By default, every user can execute system tools. A security administrator with the `SYSAUTH` privilege can grant or revoke the `EXECUTE` privilege on system tools.

## User Privileges

| Privilege | Description |
| --- | --- |
| VIEW | Ability to read information about the user. |
| ALTER | Ability to modify the user. |
| DROP | Ability to drop the user. |
| SYSAUTH | Ability to grant rights and revoke privileges on the user. |

## Group Privileges

| Privilege | Description |
| --- | --- |
| VIEW | Ability to read information about the group. |
| ALTER | Ability to alter the group. |
| DROP | Ability to drop the group. |
| SYSAUTH | Ability to grant privileges on the group. |

## System Catalog and Object or View Visibility

The `sys.privileges` table in the system catalog exposes the privileges in the system. This table displays this information:

- Timestamp of the grant
- Grantor
- Grantee
- Privilege granted
- Object type
- Object id
- Grantable

You can grant and revoke System Catalog `VIEW` and `SELECT` privileges just like ordinary tables. By default, everyone has `VIEW` and `SELECT` privileges on all system catalog tables.

You can see the objects within the system catalog tables only if you have sufficient privileges on those objects. These objects require a `VIEW` or `SELECT` privilege or membership in a group or role to provide visibility. When you execute queries against a system catalog table, you do not see or know the existence of objects to which you do not have access.

Views offer a similar functionality because the database does not check privileges to the underlying tables and views after you create a view. You can create a table with sensitive information and restrict visibility by creating a view on top of the table with only certain rows or columns. Someone else with the `SELECT` privilege to the view can query the view, even without any privileges to the underlying table.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

# Roles

Similar to groups, users can inherit privileges by being granted one of the predefined roles in Ocient. The names of and privileges assigned to roles in Ocient are predefined by the system. Roles can be applicable to the Ocient System or one of the user-defined databases. The roles in Ocient are as follows:

### System Roles

- **Security Administrator** — Can read, create, and modify all users and groups.
- **System Administrator** — Can read, create, and modify system objects such as tables, clusters, databases, etc. Can see and delete any queries system-wide.
- **System Analyst** — Read-only access to the entire system. Can see all queries in the system.

### Database Roles

- **Database Administrator** — Can read, create, and modify database objects such as tables, clusters, databases, etc. This role can also create users for the database. Can see and delete all queries in the database.
- **Database Analyst** — Read-only rights to database objects and data within the database. Can see all queries in the database.
- **Public** — Every user who has access to the database has the Public role by default. You can grant other privileges to this role. This role allows the creation of a schema using the `CREATE SCHEMA` SQL statement and allows the viewing of other roles by default.

For specifics on each Ocient role, see **Default Role Privileges**.

## Grant Role Membership

Grants a role to a user or group.

### Syntax

SQL

```
GRANT ROLE role_name TO { USER | GROUP } user_or_group_name
```

| Parameter | Data Type | Description |
| --- | --- | --- |
| `role_name` | string | The name of a role to be granted to the specified user or group.<br>Enclose this string in quotes. |
| `user_or_group_name` | string | The name of a user or group to be granted the specified role. |

### Example

This example grants `user1` the system administrator role.

SQL

```
GRANT ROLE "System Administrator" TO USER user1;
```

## Revoke Role Membership

Revokes a role from a user or group.

### Syntax

SQL

```
REVOKE ROLE role_name FROM { USER | GROUP } user_or_group_name
```

| Parameter | Data Type | Description |
| --- | --- | --- |
| `role_name` | string | The name of a role to be revoked for the specified user or group.<br>Enclose this string in quotes. |
| `user_or_group_name` | string | The name of a user or group to have the specified role revoked. |

### Example

This example revokes the system administrator role from `user1`.

```sql
REVOKE ROLE "System Administrator" FROM USER user1;
```

# Default Role Privileges

## Security Administrator Privileges

| Target | Privileges |
|---|---|
| System | SYSAUTH, CREATE [ USER ] |

## Query Visibility

The visibility of queries depends on which database you are logged into and your assigned privileges. Users with no additional VIEW QUERIES or VIEW REDACTED QUERIES privileges can view only queries that they submit themselves.

The VIEW QUERIES privilege allows access to queries for all users in these system catalog tables:

- `sys.queries`
- `sys.completed_queries`
- `sys.plans`
- `sys.active_query_scheduler_info`
- `sys.all_operator_instances`
- `sys.completed_operator_instances`
- `sys.op_inst_debug_info`

The VIEW REDACTED QUERIES privilege allows access to queries for all users in these system catalog tables, but with a redacted SQL statement for queries from other users:

- `sys.queries`
- `sys.completed_queries`

For the initial grant of query privileges, the grantor must have the `Database Administrator` or `System Administrator` role. Use the `WITH GRANT OPTION` keywords to allow a user to further grant this privilege to other users and groups.

### Login Impacts on Query Visibility

Along with having role privileges, users also must be logged into the appropriate database to view queries:

- If the user logs in to the `SYSTEM` database, the user can see all queries from all databases.
- If the user logs in to a database other than `SYSTEM`, the user can see queries in only that database.

# Data Manipulation Language (DML) Statement Reference

Reference Data Manipulation Language (DML) statements in Ocient to insert, delete, truncate, and manage transactional changes to data in tables.

DML statements let you add, remove, and manage the data stored in tables. You can write and execute DML statements like any other SQL statements in the Ocient® System. The SELECT SQL statement is sometimes considered a DML statement, and the Ocient System includes it in the Data Query Language (DQL). For details, see the **Data Query Language (DQL) Statement Reference**.

Supported DML SQL statements are:

- DELETE FROM TABLE
- INSERT INTO TABLE
- TRUNCATE TABLE

## DELETE FROM TABLE

Removes rows from the specified table.

You can use the `WHERE` clause to specify the rows to remove. If a `DELETE` SQL statement lacks the `WHERE` clause, then the database deletes all rows in the table.

To use this statement, you must have the `DELETE` privilege for the table.

For details and examples, see **Remove Records from an Ocient System**.

`DELETE` actions cannot be undone.

If a `DELETE` operation fails during execution, the database rolls back the changes and returns to its original state.

Due to limitations of the JDBC API, the reported modified row count might not be accurate for `DELETE` operations that are larger than two billion rows.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

### Syntax

```
SQL

DELETE FROM table_name [ WITH cte ] [ WHERE <filter_clause> ]
```

| Parameter | Type | Description |
|---|---|---|
| `table_name` | string | The name of the table, specified as a string, indicates where to delete rows. |
| `cte` | string | A common table expression that defines temporary data for the `DELETE` statement.<br>For details about using common table expressions, see **WITH**. |
| `<filter_clause>` | None | A logical combination of predicates that filter the rows to delete based on one or more columns.<br>For details, see the **WHERE** clause.<br>The `DELETE` SQL statement removes all rows from a table if you do not include the `WHERE` clause. |

### Examples

#### Delete Rows from the Table with Filter Criteria

This `DELETE` SQL statement removes all rows in the `movies` table that have a budget of less than `10000`.

```
SQL

DELETE FROM movies WHERE budget < 10000;
```

#### Delete Rows from the Table Using a Common Table Expression

This example uses a common table expression using the `WITH` keyword to find rows representing all transactions that occurred before 2022 that are less than $100. The `DELETE` SQL statement receives the results from the common table expression. Then, the database executes this statement to delete the corresponding rows.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

SQL

```
DELETE FROM transactions
    WITH old_transactions AS (
        SELECT
            transaction_id
        FROM
            transactions
        WHERE transaction_date < '2022-01-01'
            AND amount < 100
    )
    WHERE transaction_id IN (
        SELECT transaction_id
        FROM old_transactions );
```

# INSERT INTO TABLE

`INSERT INTO` inserts rows into a table in the current database using literal values, column references, function executions, computed expressions, or column default values.

This SQL statement requires the `INSERT` privilege for the relevant table.

> Due to limitations of the JDBC API, the reported modified row count might not be accurate for insert operations that are larger than two billion rows.

### Syntax

SQL

```
INSERT INTO table_name [ ( col1, col2 [, ...] ) ]
    [ WITH cte ] { query | [ DEFAULT VALUES | VALUES [ <rows_to_insert> ] }

<rows_to_insert> ::=
    ( row1_exp1, row1_exp2 [, ...] ),
    ( row2_exp1, row2_exp2 [, ...] )
    [, ...]
```

Using `DEFAULT VALUES` inserts a single row where each target column is populated with its column defaults (as defined in the column definition) instead of an explicit `VALUES` list.

For table columns that do not each have a defined default value, the inserted row is NULL. If the column has no default and also has the `NOT NULL` constraint, the insert operation generates an error.

| Parameter | Type | Description |
|---|---|---|
| `table_name` | string | The name of the table for insertion. |
| `col1, col2 [, ... ]` | string | A list of specific columns to insert specific values.<br><br>This column list defaults to all columns in the table if you do not specify any column names.<br><br>The `INSERT` statement can use a subset of the table columns. Any columns not included in the statement are populated with their column default value in their column definition. If the column definition does not specify a default, the inserted row is NULL. If the column has no default and also has the `NOT NULL` constraint, the insert operation generates an error. |
| `cte` | string | A common table expression that defines temporary data for the `INSERT` statement.<br>For details about using common table expressions, see **WITH**. |
| `query` | string | A `SELECT` query that defines values or a table and any of its columns that should be inserted into the specified `table_name`. |
| `row1_exp1, row1_exp2 [, ...]` | string | The expressions to insert into columns in the table. This list must match the number of columns specified in the INSERT statement. Similarly, each expression must match the data type of the column that corresponds to its position.<br><br>Expressions can be any of the following:<br><br>**Literals**: `1`, `3.14`, ‘`abc`’, `DATE '2024-01-01'`, etc.<br><br>**Column references:** If your `INSERT` statement includes a common table expression using a `WITH` clause, you can reference columns from the separate table in that clause.<br><br>**Function executions**: `ABS(-5)`, `NOW()`, `ST_DISTANCE`, etc. |

| Parameter | Type | Description |
| --- | --- | --- |
| | | **Computed expressions**: `price * quantity`, `COALESCE(x, 0)`, etc.<br><br>**Column default values**: Use the keyword `DEFAULT` to insert a default value specified in the column definition. If the column definition does not specify a default, the inserted row is NULL. If the column has no default and also has the `NOT NULL` constraint, the insert operation generates an error. |

## Examples

### Insert Values from One Column

This example inserts the columns from `system.table_b` into `system.table_a`.

SQL

```
INSERT INTO system.table_a SELECT * FROM system.table_b;
```

### Insert Values from Multiple Columns

This example inserts the column `system.table_b.id_col_b` into `system.table_a.id_col_a` and `system.table_b.int_col_b` into `system.table_a.int_col_a`.

SQL

```
INSERT INTO system.table_a (id_col_a, int_col_a)
    SELECT id_col_b, int_col_b FROM system.table_b;
```

### Insert Literal Values

Create a table with product, quantity, and date of sale information with these non-nullable columns:

- `product` — Product identifier
- `quantity` — Quantity of the product sold
- `sale_date` — Date of sale

SQL

```sql
CREATE TABLE sales (
    product INT NOT NULL,
    quantity INT NOT NULL,
    sale_date DATE NOT NULL
);
```

Insert three rows of literal values that represent different sales.

SQL

```sql
INSERT INTO sales (product, quantity, sale_date)
    VALUES
        (1, 10, '2023-01-15'),
        (2, 5, '2023-01-20'),
        (1, 8, '2023-02-05');
```

### Insert Values Using a Common Table Expression

In this example, a common table expression performs calculations on the `sales` table before inserting rows into the `monthly_sales_summary` table.

The example uses the `monthly_sales_summary` table created by this `CREATE TABLE` statement with these non-nullable columns:

- `product_id` — Product identifier
- `month` — Month part of the date
- `total_quantity` — Total quantity of the product

SQL

```sql
CREATE TABLE monthly_sales_summary (
    "product_id" INT NOT NULL,
    "month" DATE NOT NULL,
    "total_quantity" INT NOT NULL
);
```

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

The common table expression following the `WITH` keyword extracts the month from the sale date `sale_date` and calculates the sum of the quantity sold `total_quantity` of the product from the `sales` table before inserting this data. Then, the `INSERT` SQL statement specifies to insert the data into the `monthly_sales_summary` table.

SQL

```
INSERT INTO monthly_sales_summary (product_id, month, total_quantity)
WITH monthly_totals AS (
    SELECT
        product,
        DATE_TRUNC('month', sale_date) AS month,
        SUM(quantity_sold) AS total_quantity
    FROM
        sales
    GROUP BY
        product,
        DATE_TRUNC('month', sale_date)
)
SELECT
    product,
    month,
    total_quantity
FROM
    monthly_totals;
```

### Insert Columns Using Default Values

This code utilizes the `customers` table with these columns:

- `customer_id` — Customer identifier
- `name` — Customer name
- `status` — Customer status with the default `active` status
- `created_at` — Created date

SQL

```sql
CREATE TABLE customers (
    customer_id INT,
    name VARCHAR(100),
    status VARCHAR(20) DEFAULT 'ACTIVE',
    created_at TIMESTAMP
);
```

Use the `DEFAULT VALUES` keyword to insert one row of default values into the table. For columns that lack a defined default value, the operation inserts a NULL row.

SQL

```sql
INSERT INTO customers DEFAULT VALUES;
```

The resulting row contains all NULL values except for the `status` column, which has the `active` default value.

SQL

```sql
SELECT * FROM customers;
```

Output

SQL

```
| customer_id | name  | status | created_at |
| ----------- | ----- | ------ | ---------- |
|             |       | ACTIVE |            |
```

Alternatively, you can insert default values by using the `DEFAULT` keyword as one of the row values in the `INSERT` statement.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

SQL

```
INSERT INTO customers (customer_id, name, status, created_at)
    VALUES (1, 'Alice', DEFAULT, NULL);
```

Output

SQL

```
   | customer_id | name  | status | created_at |
   | ----------- | ----- | ------ | ---------- |
   |             |       | ACTIVE |            |
   | 1           | Alice | ACTIVE |            |
```

## INSERT INTO TABLE USING LOADERS

Specify one or more Loader Nodes for executing the `INSERT INTO` SQL statement. If you do not use this option, the Ocient System uses all Loader Nodes that are live to execute the SQL statement.

This statement is useful for managing loading operations, particularly when balancing multiple loads of different sizes and resource requirements. Alternatively, this statement can also help simplify small batch loads by sourcing the data from a single Loader Node.

### Syntax

SQL

```
INSERT INTO TABLE table_name USING LOADERS streamloader [, ... ]
     query
```

| Parameter | Type | Description |
|---|---|---|
| `streamloader` | string | A unique name for the Loader Node.<br>Identify the names of Loader Nodes from the `sys.nodes` table by using this query: `SELECT name FROM sys.nodes;`<br>If the name of the streamloader contains special characters, you must enclose it in quotes, such as `"stream-loader1"`. |

For the query to execute successfully, the specified names must:

- Identify nodes that are live.
- Identify nodes that have the Loader role.

### Examples

This example inserts the column `system.table_b.id_col_b` into `system.table_a.id_col_a` and `system.table_b.int_col_b` into `system.table_a.int_col_a`. Use the Loader Node named `stream-loader1` to execute this SQL statement.

SQL

```
INSERT INTO system.table_a (id_col_a, int_col_a)
    USING LOADERS "stream-loader1"
    SELECT id_col_b, int_col_b FROM system.table_b;
```

In this example, execute the same SQL statement with two Loader Nodes named `stream-loader2` and `stream-loader3`.

SQL

```
INSERT INTO system.table_a (id_col_a, int_col_a)
    USING LOADERS "stream-loader2","stream-loader3"
    SELECT id_col_b, int_col_b FROM system.table_b;
```

## TRUNCATE TABLE

`TRUNCATE TABLE` removes some or all records from an existing table in the current database. The system deletes the truncated data, but the table and its schema remain intact in the system even if all data is deleted. If the entire table is truncated, Global Dictionary Compression tables remain in place.

To truncate a table, you must have the `DELETE` privilege for the table.

To remove a subset of rows from a table, you can use the **DELETE FROM TABLE** SQL statement.

For details and examples of using `TRUNCATE`, see **Remove Records from an Ocient System**.

> ⚠ This action cannot be undone and results in data loss.

### Syntax

```
SQL

TRUNCATE TABLE table_name

TRUNCATE TABLE table_name WHERE segment_group_id = <ID>

TRUNCATE TABLE table_name WHERE segment_group_id in (<ID>, ...)
```

| Parameter | Type | Description |
|---|---|---|
| `table_name` | string | The name of the table to truncate. |
| `segment_group_id` | numeric | Identifier of the segment group. |

### Examples

This example truncates an existing table in the current database and schema named `students`.

```
SQL

TRUNCATE TABLE students;
```

This example truncates an existing table in the current database named `us.students`.

```
SQL

TRUNCATE TABLE us.students;
```

This example truncates a single segment group from an existing table in the current database named `students`.

SQL

```
TRUNCATE TABLE students WHERE segment_group_id = 123456789;
```

This example truncates a number of segment groups from an existing table in the current database named `us.students`.

SQL

```
TRUNCATE TABLE us.students WHERE segment_group_id IN (1,2,3,4,5);
```

# Data Query Language (DQL) Statement Reference

Explore Ocient SQL syntax rules, enabling users to write clear, efficient queries for data retrieval and manipulation at scale.

The OcientAIQ™ Unified Data Platform supports querying using the SQL syntax that follows ANSI SQL standards.

## Ocient SQL Syntax

This code block shows the general syntax to perform SQL querying in Ocient® and the order in which commands should go.

For specific descriptions and syntax for the commands, see the respective SQL statement sections on this page.

**Syntax**

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

SQL

```
[ WITH [ RECURSIVE ] ... ]
SELECT ...
    [ EXCEPT(...) ]
[ FROM ...
    [ JOIN ... ] ]
[ WHERE ... ]
[ GROUP BY ...
    [ HAVING ... ] ]
[ QUALIFY ... ]
[ WINDOW ... ]
[ LIMIT ... PER (...) ]
[ OFFSET ... PER (...) ]
[ ORDER BY ... ]
[ LIMIT ... | FETCH ... ]
[ OFFSET ... ]
[ INTERSECT ... ]
[ EXCEPT ... ]
[ UNION ... ] ]
[ USING ... ]
[ TRACE ... ]
[ TAG ... ]
```

Grouped `LIMIT ... PER` and `OFFSET ... PER` must appear before `ORDER BY`. Scalar `LIMIT` and `OFFSET` (without `PER`) appear after `ORDER BY`. See the **LIMIT** and **OFFSET** sections for details on both forms.

## Default Schema

Ocient identifies every table using a database and schema. For example, the fully qualified path to the `movies` table is `cinema.adventure.movies`, where `cinema` is the database and `adventure` is the schema.

When you do not fully qualify a table name, the Ocient System uses a default schema. When you first log into the system, the default schema is your fully qualified username. You can change the default schema using the **SET SCHEMA** command.

## Querying SQL Statement Reference

Ocient supports the following SQL statements.

## WITH

Assigns a name to a common table expression (CTE) so that the main query can reference an auxiliary query. This helps break complex queries into smaller parts.

### Syntax

SQL

```
WITH [ RECURSIVE ]
    <cte_name> [ ( <cte_column> [ ,... ] ) ]
    AS ( <sub_query> )
    [ , <cte_name> [ ( <cte_column> [ ,... ] ) ]
      AS ( <sub_query> ) [ ,... ] ]
<select_query>
```

### Parameters

| Parameter | Description |
|---|---|
| `RECURSIVE` | Optional. Declares the CTE as recursive, which lets the CTE reference itself. For details, see **WITH RECURSIVE**. |
| `<cte_name>` | A name for the common table expression populated with the result set from the `sub_query` statement. When you define multiple CTEs in a single `WITH` clause, each CTE can reference any CTE defined before it. |
| `<cte_column>` | Optional.<br>This is a list of column names for common table expressions populated with the `sub_query` result set. If no column names are provided, the column names are the same as the table referenced in the `sub_query` statement. |
| `<sub_query>` | An auxiliary query that collects data for a common table expression.<br>`sub_query` can use regular query commands, including ORDER BY, LIMIT, OFFSET, UNION, INTERSECT, EXCEPT, WHERE, GROUP BY, and HAVING.<br>See the respective SQL statement reference sections for usage rules. |
| `<select_query>` | The main SELECT query.<br>Note that the `FROM` statement in the main `SELECT` query must also include the `cte_name` if the query uses its values. |

### Example

In this example, the subquery calculates the average budget for all rows in the `movies` table. The main query uses that average to find all movies that spent more.

SQL

```
WITH avg_budget_table (average_budget) AS (
    SELECT AVG(budget)
    FROM movies
)
SELECT title,
    budget,
    revenue
FROM movies,
    avg_budget_table
WHERE budget > avg_budget_table.average_budget;
```

Output

| title | budget | revenue |
|---|---|---|
| CGI Why | 237000000 | 2787965087 |
| Titania | 200000000 | 1845034188 |
| Merchandise Vehicle 5 | 200000000 | 1066969703 |
| The Tentpole | 220000000 | 1519557910 |
| Pirates of Palm Springs | 140000000 | 655011224 |
| Spyman 16 | 200000000 | 1108561013 |
| Frigid | 150000000 | 1274219009 |
| Fury 7 | 190000000 | 1506249360 |
| Superhero 23 | 250000000 | 1084939099 |
| Triassic World | 150000000 | 1513528810 |
| Iron Chef 3 | 200000000 | 1215439994 |
| The Last Airman | 150000000 | 318502923 |

## WITH RECURSIVE

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

The `WITH RECURSIVE` clause defines a recursive common table expression (CTE) that references itself. Recursive CTEs enable iterative computations, such as traversing hierarchical data, generating sequences, and walking graph structures.

A recursive CTE consists of two parts joined by `UNION ALL` or `UNION`:

- Anchor member — A non-recursive base query that produces the initial result set.
- Recursive member — A query that references the CTE by name and produces additional rows in each iteration.

The recursion terminates when the recursive member returns no rows.

The `RECURSIVE` keyword is optional. If you omit it but the CTE references itself, the database automatically detects the self-reference and treats the CTE as recursive.

### Syntax

SQL

```
WITH [ RECURSIVE ] <cte_name> [ ( <cte_column> [ ,... ] ) ] AS (
    <anchor_query>
    { UNION ALL | UNION }
    <recursive_query>
)
<main_query>
```

### Parameters

| Parameter | Description |
|---|---|
| `RECURSIVE` | Optional. Declares the CTE as recursive. If you omit this keyword, the system automatically detects self-referencing CTEs. |
| `<cte_name>` | A name for the recursive CTE. The recursive member references this name to access rows from the previous iteration. |
| `<cte_column>` | Optional. A list of column names for the CTE result set. If you provide this list, the column count must match the number of columns that the anchor query returns. |
| `<anchor_query>` | A non-recursive query that produces the initial (base case) rows. |
| `<recursive_query>` | A query that references `<cte_name>`. In each iteration, the recursive member reads only the new rows produced by the previous iteration (not the full |

| Parameter | Description |
| --- | --- |
| | accumulated result). The recursion stops when this query returns no rows. |
| `<main_query>` | The primary query that reads from the completed recursive CTE result. This parameter can be a `SELECT` SQL statement or a DML statement. For supported DML statements and examples, see **Use Recursive CTEs with DML Statements**. |

### Choose Between `UNION ALL` and `UNION` Keywords

- `UNION ALL` — Accumulates all rows from every iteration without deduplication. Use this keyword for most recursive queries.
- `UNION` — Removes duplicate rows at each iteration by comparing new rows against all previously accumulated rows. Use this keyword to guarantee termination on cyclic data, for example, a graph traversal where a node can appear in multiple paths. This keyword is the `UNION` set operator, which is unrelated to the `DISTINCT` keyword that the recursive member cannot contain.

### Configuration

The `sql.maxRecursiveQueryIterations` system parameter controls the maximum number of iterations a recursive CTE can perform, which prevents runaway recursion. The system enables recursive queries by default.

| Value | Behavior |
| --- | --- |
| `0` | The system disables recursive queries. Any recursive CTE returns an error. |
| `> 0` | The maximum number of iterations. Exceeding this limit returns an error. The default is `1000`. |
| `-1` | Unlimited iterations. The system applies no iteration cap, so a recursive query over cyclic data that uses the `UNION ALL` keyword does not terminate on its own. |

You can set this parameter with the `ALTER SYSTEM ALTER CONFIG SET` statement. The change applies system-wide and propagates asynchronously, so there might be a brief delay before the new value takes effect on all SQL Nodes.

```sql
ALTER SYSTEM ALTER CONFIG
    SET 'sql.maxRecursiveQueryIterations' = '100';
```

### Structural Rules

The recursive member of a CTE must follow these rules:

- The recursive member must use the `UNION ALL` or `UNION` keywords to combine with the anchor. The member cannot use the `EXCEPT` or `INTERSECT` set operator keywords.
- The recursive member cannot contain the `GROUP BY` clause, the `HAVING` clause, or aggregate functions.
- The recursive member cannot contain the `DISTINCT` keyword, the `LIMIT` clause, or the `OFFSET` clause.
- The recursive member cannot contain window functions.
- The recursive reference cannot appear on the NULL-producing side of an outer join ( `LEFT JOIN` , `RIGHT JOIN` , or `FULL OUTER JOIN` ).
- The recursive reference cannot appear inside `NOT IN` , `NOT EXISTS` , or other negation predicates.
- The recursive member cannot reference the CTE more than once, which rules out self-joins and nonlinear recursion.
- Two CTEs cannot reference each other. The system does not support mutual recursion.

### `EXPLAIN` SQL Statement Support

Executing the `EXPLAIN` SQL statement on a recursive query returns the data flow script that the database generates to execute the recursion. You can execute the `EXPLAIN` statement on individual statements within that script to inspect their execution plans.

### Examples

### Generate a Sequence of Integers

This recursive CTE generates a sequence of integers from `1` to `10` .

SQL

```sql
WITH RECURSIVE counter(n) AS (
    SELECT 1
    UNION ALL
    SELECT n + 1
    FROM counter
    WHERE n < 10
)
SELECT n FROM counter;
```

Output

| n |
| --- |
| 1 |
| 2 |
| 3 |
| 4 |
| 5 |
| 6 |
| 7 |
| 8 |
| 9 |
| 10 |

### Traverse an Employee Hierarchy

This example traverses an employee hierarchy starting from the top-level manager ( `WHERE manager_id is NULL` ) and walks down to all reports.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

SQL

```sql
WITH RECURSIVE org_tree(staff_id, name, manager_id, depth) AS (
    SELECT staff_id, first_name, manager_id, 0
    FROM company.staffs
    WHERE manager_id IS NULL
    UNION ALL
    SELECT s.staff_id, s.first_name, s.manager_id,
        org_tree.depth + 1
    FROM company.staffs s
    INNER JOIN org_tree
        ON org_tree.staff_id = s.manager_id
)
SELECT staff_id, name, depth
FROM org_tree
ORDER BY depth, name;
```

Output

| staff_id | name | depth |
|---|---|---|
| 1 | Diana | 0 |
| 2 | Ethan | 1 |
| 3 | Farah | 1 |
| 4 | Gabriel | 2 |
| 5 | Hana | 2 |
| 6 | Ivan | 2 |

### Traverse a Graph with Cycles

This example uses the `UNION` keyword to traverse a graph with cycles and guarantee termination. Because the `UNION` keyword removes duplicate rows, the recursion stops when the database does not recover any new nodes.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

SQL

```sql
WITH RECURSIVE reachable(node_id) AS (
    SELECT 1
    UNION
    SELECT e.target_id
    FROM edges e
    INNER JOIN reachable r
        ON r.node_id = e.source_id
)
SELECT node_id FROM reachable
ORDER BY node_id;
```

Output

| node_id |
| --- |
| 1 |
| 2 |
| 3 |
| 4 |

## Use Recursive CTEs with DML Statements

You can use recursive CTEs with `INSERT INTO ... SELECT`, `CREATE TABLE AS SELECT (CTAS)`, and `DELETE` SQL statements. In each case, the `WITH RECURSIVE` clause follows the table name of the DML statement, for example, after `INSERT INTO table_name`.

### Examples

### Insert Rows Using a Recursive CTE

This example inserts the result of a recursive CTE into an existing table. The target table must already exist with a compatible schema.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

SQL

```
INSERT INTO number_sequences
WITH RECURSIVE seq(n) AS (
    SELECT 1
    UNION ALL
    SELECT n + 1 FROM seq WHERE n < 100
)
SELECT n FROM seq;
```

This statement inserts 100 rows (integers `1` through `100`) into the `number_sequences` table.

SQL

```
SELECT COUNT(*) AS row_count FROM number_sequences;
```

Output

| row_count |
| --- |
| 100 |

### Create a Table Using a Recursive CTE

This example creates a new table from the result of a recursive CTE. For the `CREATE TABLE AS SELECT` SQL statement, add the `AS` keyword between the table name and the `WITH RECURSIVE` clause.

SQL

```
CREATE TABLE fibonacci AS
WITH RECURSIVE fib(n, a, b) AS (
    SELECT 1, 0, 1
    UNION ALL
    SELECT n + 1, b, a + b FROM fib WHERE n < 20
)
SELECT n, a AS fib_value FROM fib;
```

© 2026 Ocient, Inc

Querying the created table returns the first 20 Fibonacci numbers.

```sql
SELECT * FROM fibonacci;
```

Output

| n | fib_value |
|---|---|
| 1 | 0 |
| 2 | 1 |
| 3 | 1 |
| 4 | 2 |
| 5 | 3 |
| 6 | 5 |
| 7 | 8 |
| 8 | 13 |
| 9 | 21 |
| 10 | 34 |
| 11 | 55 |
| 12 | 89 |
| 13 | 144 |
| 14 | 233 |
| 15 | 377 |
| 16 | 610 |
| 17 | 987 |
| 18 | 1597 |
| 19 | 2584 |
| 20 | 4181 |

© 2026 Ocient, Inc Ocient Proprietary and Confidential

### Delete Rows Using a Recursive CTE

This example uses a recursive CTE to delete a range of rows from the `number_sequences` table. The CTE generates the rows to delete, and the `DELETE` SQL statement removes any row whose `n` value matches the CTE result.

SQL

```sql
DELETE FROM number_sequences
WITH RECURSIVE seq(n) AS (
    SELECT 91
    UNION ALL
    SELECT n + 1 FROM seq WHERE n < 100
)
WHERE n IN (SELECT n FROM seq);
```

This statement deletes 10 rows (integers `91` through `100`), leaving 90 rows in the `number_sequences` table.

SQL

```sql
SELECT COUNT(*) AS row_count FROM number_sequences;
```

Output

| row_count |
| --- |
| 90 |

## Use Recursive CTEs in Views

You can define a view that contains a recursive CTE. The `CREATE VIEW` SQL statement succeeds even when the `sql.maxRecursiveQueryIterations` configuration parameter is `0` (disabled), because the system detects the recursion when you query the view, not when you create it.

SQL

```sql
CREATE VIEW org_hierarchy AS
WITH RECURSIVE org_tree(staff_id, name, depth) AS (
    SELECT staff_id, first_name, 0
    FROM company.staffs
    WHERE manager_id IS NULL
    UNION ALL
    SELECT s.staff_id, s.first_name, org_tree.depth + 1
    FROM company.staffs s
    INNER JOIN org_tree
        ON org_tree.staff_id = s.manager_id
)
SELECT * FROM org_tree;
```

Querying the view returns the employee hierarchy starting from the top-level manager.

SQL

```sql
SELECT * FROM org_hierarchy ORDER BY depth, name;
```

Output

| staff_id | name | depth |
|---|---|---|
| 1 | Diana | 0 |
| 2 | Ethan | 1 |
| 3 | Farah | 1 |
| 4 | Gabriel | 2 |
| 5 | Hana | 2 |
| 6 | Ivan | 2 |

## SELECT

Initiates a query statement or a subquery clause within other statements.

You can query the data of tables where you have the SELECT privilege.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

For information on using SELECT as a subquery for filtering or ordering results, see the **WHERE** and **HAVING** sections.

For information on using SELECT as a subquery for a common table expression, see the **WITH** section.

> `SELECT *` queries that lack a `FROM` clause automatically reference the `sys.dummy1` table.
>
> For example, `SELECT *;` is the same as `SELECT * FROM sys.dummy1;` .

### Syntax

SQL

```
SELECT [ ALL | DISTINCT ]
    [ * [ EXCEPT ( column_name [ , ... ] ) ]
    | <select_list_entry> [ , ... ] ]
    [ <from_clause> ]
```

### Parameters

| Parameter | Description |
|---|---|
| `ALL` | `SELECT` and `SELECT ALL` are both the same.<br>Returns all valid data rows from the database that meet the criteria of your query. |
| `DISTINCT` | `SELECT DISTINCT` returns only unique rows that do not match other rows based on the criteria of your query. |
| `*` | Returns all columns from the specified tables in the result set for the query. |
| `EXCEPT` | When used with `*`, `EXCEPT` allows specific columns to be excluded from the query results. |
| `column_name` | The name of one or more columns from the specified table that you want to exclude (using `EXCEPT` ) from your query results. |

## <select_list_entry>

The `select_list_entry` defines a column or expression to include in your query result set.

### Syntax

```
SQL

<select_list_entry> ::=
    column_name | expression [ AS new_name ]
```

### Parameters

| Parameter | Description |
|---|---|
| `column_name` | The name of one or more columns from the specified table that you want to include in your query results. |
| `expression` | One or more expressions that you want to include in your query results. Expressions can be any combination of literal values, column names, arithmetic expressions, parentheses, and function calls. |
| `new_name` | An alias, treated as an identifier, for an alternative name for the column or the results of the expression. |

## <from_clause>

For information on the `<from_clause>`, see the **FROM** documentation.

### Examples

## Using SELECT *

This example uses `SELECT *` to return all the columns in the `movies` table.

```
SQL

SELECT * FROM movies LIMIT 5;
```

Output

| movie_id | title | budget | popularity | release_date |
|---|---|---|---|---|
| 211672 | Minnows | 74000000 | 875.581305 | 2015-06-17 |
| 24 | Billy the Killy | 30000000 | 79.754966 | 2003-10-10 |

| movie_id | title | budget | popularity | release_date |
|---|---|---|---|---|
| 19995 | CGI Why | 237000000 | 150.437577 | 2009-12-10 |
| 37724 | Spyman 16 | 200000000 | 93.004993 | 2012-10-25 |
| 24428 | The Tentpole | 220000000 | 144.448633 | 2012-04-25 |

## Using SELECT * EXCEPT

This example uses `SELECT * EXCEPT` to exclude certain columns from the result set.

SQL

```sql
SELECT *
EXCEPT (movie_id, runtime, vote_average, vote_count)
FROM movies
LIMIT 5;
```

Output

| title | budget | release_date | revenue |
|---|---|---|---|
| Swords & Scabbards | 94000000 | 2003-12-01 | 1118888979 |
| Billy the Killy | 30000000 | 2003-10-10 | 180949000 |
| Merchandise Vehicle 5 | 200000000 | 2010-06-16 | 1066969703 |
| CGI Why | 237000000 | 2009-12-10 | 2787965087 |
| Space Odyssey 6000 | 10500000 | 1968-04-10 | 68700000 |

## Using Lateral Column Aliases

Ocient SQL queries support lateral column aliases, meaning you can immediately reuse aliases for calculations in the same query as new inputs. Hence, you can simplify queries that normally require subqueries and common table expressions.

These examples use the `products` table with these columns:

- `product_id` — Product identifier as an integer
- `product_name` — Product name as a string

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

- `price` — Price as a floating point number

Create this table using the `CREATE TABLE` SQL statement.

SQL

```sql
CREATE TABLE products (
    product_id INT,
    product_name VARCHAR(100),
    price DECIMAL(10, 2)
    );
```

Insert four records into the `products` table.

SQL

```sql
INSERT INTO products (product_id, product_name, price) VALUES
    (1, 'Laptop', 1000.00),
    (2, 'Tablet', 500.00),
    (3, 'Smartphone', 800.00),
    (4, 'Monitor', 300.00);
```

Create a query to determine prices after discounts and taxes by using a common table expression subquery `DiscountedPrices`. Use the `WITH` keyword to create the subquery.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

SQL

```sql
WITH DiscountedPrices AS (
    SELECT
        product_id,
        product_name,
        price,
        price * 0.90 AS discounted_price,
        price * 0.90 * 1.05 AS total_price_after_tax
    FROM
        products
)
SELECT
    product_id,
    product_name,
    price,
    discounted_price,
    total_price_after_tax
FROM
    DiscountedPrices;
```

Lateral aliases allow the same calculations to be packaged in a single query.

This simpler query is essentially the same as the longer common table expression example, but the logic is condensed because you can reference the `discounted_price` alias immediately to calculate the `total_price_after_tax` value in the same query.

SQL

```sql
SELECT
    product_id,
    product_name,
    price,
    price * 0.90 AS discounted_price,
    discounted_price * 1.05 AS total_price_after_tax
FROM
    products;
```

## FROM

Specifies the table or view to use in a `SELECT` statement.

### Syntax

```SQL
<select_clause> FROM
    { table_name | ( <sub_query> ) | ( <values_clause> ) } [ ,... ]
    [ <join_clause> [ ,... ] ]
```

### Parameters

| Parameter | Description |
|---|---|
| `<select_clause>` | A query statement using the `SELECT` SQL statement. For details, see the **SELECT** section. |
| `table_name` | The names of one or more tables or views that you want to query.<br>If you specify multiple tables in the `FROM` list, separated by commas, the effect is the same as if you explicitly perform a **CROSS JOIN** on all of those sources. |
| `<sub_query>` | One or more subqueries using the `SELECT` SQL statement. A subquery generates a table from which the `select_clause` query references data.<br>Each subquery must be enclosed in parentheses with an optional correlation name.<br>For details, see the **SELECT** section. |
| `<values_clause>` | Use the VALUES keyword to define a table with data. For example, the `SELECT * FROM (VALUES (1, NULL), (2, 5))` SQL statement selects all the data from a table defined by the specified values as `(1, NULL)` for the first row with two columns, and `(2, 5)` for the second row. |
| `<join_clause>` | A `JOIN` clause used to retrieve data from two or more tables for your query.<br>For details, see the **JOIN** section. |

## JOIN

Combines rows from multiple tables so they can be accessed by a query.

### Syntax

```SQL
<select_query>
    FROM <table_reference1> <join_operation> <table_reference2>
        ON table1_column <boolean_operator> table2_column
```

### Parameter

| Parameter | Description |
| --- | --- |
| `<select_query>` | A valid `SELECT` query.<br>For details, see **SELECT**. |
| `<table_reference1>` | Either a table name or a full `SELECT` in parentheses<br>`table_reference1` takes precedence for returning rows for `LEFT OUTER JOIN`, `SEMI JOIN`, and `ANTI JOIN`. For specific rules, see **Types of Join Operations**. |
| `<table_reference2>` | Either a table name or a full `SELECT` in parentheses function.<br>`table_reference2` takes precedence for returning rows for `RIGHT OUTER JOIN`.<br>For specific rules, see **Types of Join Operations**. |
| `table1_column` | A column from either `table_reference`<br>The `JOIN` operation uses this column to match rows with `table2_column` to combine data for the result set. |
| `<boolean_operator>` | Join conditions can use any Boolean expression, including `=`, `!=`, `<`, `>`, `=>`, and `<=`. |
| `table2_column` | A column from the `table_reference` not used for `table1_column`<br>The `JOIN` operation uses this column to match rows based on the `table1_column` to combine data for the result set. |

## Types of Join Operations ( `<join_operation>` )

Ocient supports the following types of `JOIN` operations.

### Syntax

SQL

```
<join_operation> ::=
    { INNER JOIN
    | LEFT [ OUTER ] JOIN
    | RIGHT [ OUTER ] JOIN
    | FULL [ OUTER ] JOIN
    | CROSS JOIN
    | SEMI JOIN
    | ANTI JOIN }
```

## JOIN Type Descriptions

| JOIN Type | Description |
| --- | --- |
| `INNER JOIN` | Returns all rows that exist in both tables. This join type is the default type of join. |
| `LEFT OUTER JOIN` | Returns all rows from the first table regardless of whether there are matching rows in the second table.<br>`LEFT JOIN` performs the same operation as `LEFT OUTER JOIN`. |
| `RIGHT OUTER JOIN` | Returns all rows from the second table regardless of whether there are matching rows in the first table.<br>`RIGHT JOIN` performs the same operation as `RIGHT OUTER JOIN`. |
| `FULL OUTER JOIN` | Returns all matched and unmatched rows.<br>`FULL JOIN` performs the same operation as `FULL OUTER JOIN`. |
| `CROSS JOIN` | Returns the Cartesian product of the joined tables. Each row in the first table is joined with all rows in the second table. The result set contains the number of rows in the first table multiplied by the number of rows in the second table. |
| `SEMI JOIN` | Returns the rows from the first table that have at least one match in the second table. No columns from the second table are available in the query. |
| `ANTI JOIN` | Returns the rows from the first table that have no matches in the second table. No columns from the second table are available in the query. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

By default, `JOIN` statements that involve subqueries can operate laterally if necessary. This behavior allows subqueries to reference joined columns from the preceding items included in the `FROM` clause.

For example, both parts of this join operation use subqueries that reference table `x`. The `LATERAL` keyword is optional; the join operation acts the same regardless of whether it is included.

Text

```
SELECT \* FROM
    (
    SELECT
        1 AS cx1,
        2 AS cx2) AS x
INNER JOIN LATERAL (
    SELECT
        x.cx1 AS cy1,
        x.cx2 AS cy2) AS y
ON
    x.cx1 = y.cy1;
```

Lateral joins are primarily useful when a cross-referenced column is necessary for computing the rows to join. A common application is providing an argument value for a set-returning function.

## Examples

These examples join two tables:

- `games` — A table of video game titles and their genre_ids. Note that some games have a NULL value assigned to their genre_id.

| game_name | genre_id |
|---|---|
| Star Battle 6000 | 9 |
| Dwarf Simulator | NULL |
| 2002 Futbol | 11 |
| Space Attack! | 9 |
| Fantasy Fool | 8 |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| game_name | genre_id |
|---|---|
| Blasto the Squirrel | 5 |
| Trucker Quest | 7 |
| Block, Stack, and Cry! | 6 |
| Basketball Day | 11 |
| Pizza Mutant | 1 |
| Italian Plumber | 5 |
| Zombies! | 1 |
| Space Ninjas | 12 |
| Moon Mayor | 10 |
| Spreadsheet Hero | NULL |
| Zoom Tycoon | 12 |
| Porch Poacher | 6 |

- `genre` — A table of video game genres, which are identified by IDs.

| genre_name | id |
|---|---|
| Racing | 7 |
| Puzzle | 6 |
| Adventure | 2 |
| Simulation | 10 |
| Shooter | 9 |
| Misc | 4 |
| Action | 1 |
| Sports | 11 |
| Role-Playing | 8 |
| Platform | 5 |
| Strategy | 12 |
| Fighting | 3 |

© 2026 Ocient, Inc Ocient Proprietary and Confidential

## INNER JOIN

This example uses an `INNER JOIN` operation to capture only the rows that exist in both tables. Games with NULL values for their `genre_id` are eliminated from the result set.

SQL

```
SELECT game_name,
    genre_name
FROM video_games.game
    INNER JOIN video_games.genre ON game.genre_id = genre.id;
```

Output

| game_name | genre_name |
|---|---|
| Fantasy Fool | Role-Playing |
| Blasto the Squirrel | Platform |
| Italian Plumber | Platform |
| Porch Poacher | Puzzle |
| Space Ninjas | Strategy |
| Basketball Day | Sports |
| 2002 Futbol | Sports |
| Moon Mayor | Simulation |
| Block, Stack, and Cry! | Puzzle |
| Zombies! | Action |
| Pizza Mutant | Action |
| Space Attack! | Shooter |
| Trucker Quest | Racing |
| Zoom Tycoon | Strategy |

## LEFT OUTER JOIN

This example uses a `LEFT OUTER JOIN` operation to capture all rows from the left table (game), even if they have no matching row in the right table (genre).

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

```sql
SELECT game_name,
    genre_name
FROM video_games.game
    LEFT OUTER JOIN video_games.genre ON game.genre_id = genre.id;
```

Output

| game_name | genre_name |
|---|---|
| Fantasy Fool | Role-Playing |
| Space Ninjas | Strategy |
| Zoom Tycoon | Strategy |
| Zombies! | Action |
| Pizza Mutant | Action |
| Trucker Quest | Racing |
| Blasto the Squirrel | Platform |
| 2002 Futbol | Sports |
| Basketball Day | Sports |
| Italian Plumber | Platform |
| Block, Stack, and Cry! | Puzzle |
| Star Battle 6000 | Shooter |
| Dwarf Simulator | NULL |
| Moon Mayor | Simulation |
| Porch Poacher | Puzzle |
| Spreadsheet Hero | NULL |
| Space Attack! | Shooter |

## RIGHT OUTER JOIN

This example uses a `RIGHT`` OUTER JOIN` operation to capture all rows from the right table (genre), even if they have no matching row in the left table (game).

© 2026 Ocient, Inc Ocient Proprietary and Confidential

```sql
SELECT game_name,
    genre_name
FROM video_games.game
    RIGHT OUTER JOIN video_games.genre ON game.genre_id = genre.id;
```

Output

| game_name | genre_name |
|---|---|
| NULL | Adventure |
| Trucker Quest | Racing |
| Pizza Mutant | Action |
| Moon Mayor | Simulation |
| Fantasy Fool | Role-Playing |
| Space Attack! | Shooter |
| NULL | Misc |
| Star Battle 6000 | Shooter |
| Space Ninjas | Strategy |
| Porch Poacher | Puzzle |
| Block, Stack, and Cry! | Puzzle |
| Blasto the Squirrel | Platform |
| Italian Plumber | Platform |
| Zoom Tycoon | Strategy |
| NULL | Fighting |
| Zombies! | Action |
| 2002 Futbol | Sports |
| Basketball Day | Sports |

## FULL OUTER JOIN

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

This example uses a `FULL OUTER JOIN` operation to capture all rows from both tables, even if they do not match.

SQL

```sql
SELECT game_name,
    genre_name
FROM video_games.game
    FULL OUTER JOIN video_games.genre ON game.genre_id = genre.id;
```

Output

| game_name | genre_name |
|---|---|
| Basketball Day | Sports |
| 2002 Futbol | Sports |
| Zombies! | Action |
| Blasto the Squirrel | Platform |
| Moon Mayor | Simulation |
| Trucker Quest | Racing |
| NULL | Misc |
| Star Battle 6000 | Shooter |
| Space Attack! | Shooter |
| Spreadsheet Hero | NULL |
| NULL | Adventure |
| NULL | Fighting |
| Italian Plumber | Platform |
| Pizza Mutant | Action |
| Dwarf Simulator | NULL |
| Fantasy Fool | Role-Playing |
| Block, Stack, and Cry! | Puzzle |
| Space Ninjas | Strategy |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| game_name | genre_name |
|---|---|
| Zoom Tycoon | Strategy |
| Porch Poacher | Puzzle |

## CROSS JOIN

This example uses a `CROSS JOIN` operation to capture every possible combination of rows from both tables, regardless of whether they match. Note that, unlike other `JOIN` operations, `CROSS JOIN` does not require an `ON` statement.

SQL

```
SELECT game_name,
    genre_name
FROM video_games.genre
    CROSS JOIN video_games.game;
```

Output

As the result set for this CROSS JOIN example is more than 200 rows, the results are abbreviated.

| genre_name | genre_id |
|---|---|
| Spreadsheet Hero | Role-Playing |
| Spreadsheet Hero | Misc |
| Spreadsheet Hero | Sports |
| Spreadsheet Hero | Platform |
| Spreadsheet Hero | Strategy |
| Spreadsheet Hero | Shooter |
| Spreadsheet Hero | Fighting |
| Spreadsheet Hero | Action |
| Spreadsheet Hero | Simulation |
| Spreadsheet Hero | Racing |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| genre_name | genre_id |
|---|---|
| Spreadsheet Hero | Puzzle |
| Spreadsheet Hero | Adventure |
| Space Attack! | Role-Playing |
| Space Attack! | Misc |
| Space Attack! | Sports |
| Space Attack! | Platform |
| Space Attack! | Strategy |
| Space Attack! | Shooter |
| Space Attack! | Fighting |
| Space Attack! | Action |
| Space Attack! | Simulation |
| Space Attack! | Racing |
| Space Attack! | Puzzle |
| Space Attack! | Adventure |
| ... | ... |

## SEMI JOIN

This example uses a `SEMI JOIN` operation to capture genre names that have at least one match in the games table. Rows are only included once, even if there are multiple matches.

SQL

```sql
SELECT genre_name,
    id
FROM video_games.genre
    SEMI JOIN video_games.game ON genre.id = game.genre_id;
```

Output

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| genre_name | genre_id |
|---|---|
| Simulation | 10 |
| Shooter | 9 |
| Racing | 7 |
| Strategy | 12 |
| Puzzle | 6 |
| Platform | 5 |
| Action | 1 |
| Sports | 11 |
| Role-Playing | 8 |

## ANTI JOIN

This example uses an `ANTI JOIN` operation to capture any rows in the game table that do not match any rows in the genre table.

SQL

```sql
SELECT game_name
FROM video_games.game
    ANTI JOIN video_games.genre ON game.genre_id = genre.id;
```

Output

| game_name |
|---|
| Spreadsheet Hero |
| Dwarf Simulator |

## WHERE

Filters rows based on a specified condition.

### Syntax

SQL

```
<select_query>
    WHERE { column_name <filter_condition> filter_value |
    [ NOT ] EXISTS ( <sub_query> ) }
```

### Parameters

| Parameter | Description |
|---|---|
| `<select_query>` | A valid `SELECT` query. |
| `column_name` | A column used for grouping that is evaluated by the `filter_condition`. |
| `filter_value` | A value used to evaluate the specified `column_name`.<br>For details, see the **<filter_condition>** section. |
| `<sub_query>` | A subquery with a filter condition that follows the `EXISTS` clause.<br>For details, see the **EXISTS** section. |

## <filter_condition>

A logical combination of predicates used to evaluate the referenced `column_name` based on the `filter_value`.

### Syntax

SQL

```
<filter_condition> ::=
  { =
    | ==
    | <>
    | !=
    | [ NOT ] EQUALS
    | <
    | <=
    | >
    | >=
    | [ NOT ] IN
    | [ NOT ] LIKE
    | [ NOT ] SIMILAR TO
    | BETWEEN
    | FOR SOME
    | FOR ALL
    | IS [ NOT ] NULL
    | IS [ NOT ] DISTINCT FROM
  }
```

## Definitions

| Operator | Description | Example |
|---|---|---|
| `=` , `==` , `EQUALS` | Equal to. | `Author = 'Alcott'` |
| `<>` , `!=` | Not equal to | `Dept <> 'Sales'` |
| `>` | Greater than | `Hire_Date > '2012-01-31'` |
| `<` | Less than | `Bonus < 50000.00` |
| `>=` | Greater than or equal | `Dependents >= 2` |
| `<=` | Less than or equal | `Rate <= 0.05` |
| `[ NOT ] LIKE` | Begins with a character pattern to match.<br>The pattern is enclosed in parentheses and can include the wildcard characters `%` , representing zero, one or multiple characters, and `_` representing a single character.<br>To have a literal `%` or `_` that does not act as a wildcard on the right-hand side of a `LIKE` or `NOT` | `Full_Name LIKE 'Will%'` |

| Operator | Description | Example |
| --- | --- | --- |
| | `LIKE` expression, put a backslash before the character. | |
| `[ NOT ] SIMILAR TO` | For usage information, see the **SIMILAR TO Operator** section. | `'abc' SIMILAR TO 'abc'` |
| `BETWEEN value1 AND value2` | Requires two values.<br>The filter evaluates to TRUE if the specified column is within the range between the two values. `BETWEEN` bounds are inclusive. Values can be times, numbers, or strings. | `Sales BETWEEN 1000 AND 5000` |
| `FOR_SOME()` | Evaluates an array to determine if at least one value meets the filter criteria.<br>In the example, the `FOR_SOME()` operator would return all rows of the column `col_int_array` where at least one value is greater than 10.<br>For details, see **Array Filters**. | `FOR_SOME(col_int_array) > 10`<br><br>`FOR_SOME(col_int_array) > 10` |
| `FOR_ALL()` | Evaluates all values of an array to determine if all meet the filter criteria.<br>In the example, the `FOR_ALL()` operator would return any rows of the column `col_int_array` where all values are greater than 10.<br>For details, see **Array Filters**. | `FOR_ALL(col_int_array) > 10`<br><br>`FOR_ALL(col_int_array) = 1` |
| `[ NOT ] IN` | Equal to one of multiple possible values | `DeptCode IN (101, 103, 209)` |
| `IS [ NOT ] NULL` | Compare to `NULL` (missing data) | `Address IS NOT NULL` |
| `IS [ NOT ] DISTINCT FROM` | Compares the equality of two expressions for a Boolean result, including comparisons that involve `NULL` values. This operator ensures reliable comparisons in scenarios where `NULL` values need to be treated as significant data points.<br>Normally, `NULL = NULL` evaluates to `false` because `NULL` represents an unknown value. However, the statement `a IS NOT DISTINCT FROM b` treats `NULL` as a comparable value and returns `true` when both values are `NULL` or when `a = b`. Inversely, `a IS DISTINCT FROM b` returns `true` if the values are different or if one value is `NULL` while the other is not `NULL`. | `Debt IS NOT DISTINCT FROM Receivables` |

## EXISTS

An `EXISTS` clause used in a `WHERE` statement evaluates if a subquery returns any rows.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

For each row that the database computes in the outer query, if the subquery returns at least one row, the `EXISTS` clause evaluates to `true`. In this outcome, the outer query returns its row.

If the subquery returns zero rows, the `EXISTS` clause evaluates to `false`, and the outer query excludes those rows.

The `NOT EXISTS` clause performs the opposite Boolean logic. In this case, the outer query returns rows only when the subquery has no matches.

**Examples**

These examples use two tables, one for company departments and the other for employees assigned to those departments.

Create the `departments` table for department data.

SQL

```
CREATE TABLE departments (
    id INT,
    name VARCHAR(50)
);
```

Create the `employees` table for employee data.

SQL

```
CREATE TABLE employees (
    id INT,
    name VARCHAR(50),
    department_id INT
);
```

Insert department data for three departments, `HR`, `IT`, and `Marketing`, into the `departments` table.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

SQL

```sql
INSERT INTO departments (id, name) VALUES
    (1, 'HR'),
    (2, 'IT'),
    (3, 'Marketing');
```

Insert employee data for four employees, `Alice`, `Bob`, `Charlie`, and `David`, into the `employees` table.

SQL

```sql
INSERT INTO employees (id, name, department_id) VALUES
    (1, 'Alice', 1),
    (2, 'Bob', 2),
    (3, 'Charlie', 2),
    (4, 'David', 4);
```

### Find Employees Belonging to an Existing Department

This example uses an `EXISTS` clause to find any names from the `employees` table who are assigned to a department listed in the `departments` table.

SQL

```sql
SELECT name
FROM employees AS e
WHERE EXISTS (
    SELECT *
    FROM departments AS d
    WHERE e.department_id = d.id
);
```

The query returns all employees except `David`, who is assigned to a department that does not exist in the `departments` table.

Output

Text

```
Bob
Charlie
Alice
```

### Find Departments That Have Employees

This query returns departments that have at least one employee. The subquery uses `SELECT 1` to check whether any matching rows exist in the `employees` table. The output is the same if the query uses `SELECT *` instead.

SQL

```sql
SELECT name
FROM departments AS d
WHERE EXISTS (
    SELECT 1
    FROM employees AS e
    WHERE e.department_id = d.id
);
```

The query results exclude the `Marketing` department because no employees belong to it.

Output

Text

```
HR
IT
```

### Filter Departments Based on an Uncorrelated Table

In this example, the outer query filters the `departments` table where `id != 3` (excluding the `Marketing` department). The subquery checks if there is at least one employee with a department identifier less than `4`.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

The query is uncorrelated because the subquery does not reference the `departments` table.

SQL

```sql
SELECT *
FROM departments d
WHERE d.id != 3
AND EXISTS (
    SELECT *
    FROM employees e
    WHERE e.department_id < 4
);
```

Output

Text

```
HR
IT
```

### Find Employees Without a Valid Department

This example uses a `NOT EXISTS` clause. The example returns only employees who are assigned to a department identifier `department_id` not listed in the `departments` table.

SQL

```sql
SELECT name
FROM employees AS e
WHERE NOT EXISTS (
    SELECT *
    FROM departments AS d
    WHERE e.department_id = d.id
);
```

*Output: * `David`

## SIMILAR TO Operator

`SIMILAR TO` is a keyword that extends the `LIKE` operator, adding more features for match filtering, including many metacharacters used in regular expressions.

`%` and `_` both act as wildcard operators, but other supported metacharacters match traditional regular expressions.

### Syntax

```SQL
WHERE string1 SIMILAR TO string2
```

This table describes the metacharacters supported by the `SIMILAR TO` keyword.

| Metacharacter | Description |
|---|---|
| `%` | Repeated wildcard, matches any characters zero or more times. Equivalent usage to `LIKE`. |
| `_` | Wildcard, matches exactly one character. Equivalent usage to `LIKE`. |
| `\|` | Alteration, meaning either of two alternatives ( `a\|b` represents `a` or `b` ). |
| `*` | Repetition of zero or more times. |
| `+` | Repetition of one or more times. |
| `?` | Repetition of zero or one times. |
| `{m}` | Repetition of exactly `m` times. |
| `{m,n}` | Repetition between `m` and `n` times (inclusive). |
| `{m,}` | Repetition of at least `m` times. |
| `()` | Logical grouping. |
| `[]` | A character class, equivalent to character classes in regular expressions. Example: `[a-z]` is any lowercase English letter. |
| `^` | Beginning of the line anchor and the negation in character classes. |
| `$` | End of the line anchor. |

`SIMILAR TO` also supports escaping these metacharacters with `\` and certain escape sequences supported by C family languages.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Metacharacter | Description |
| --- | --- |
| `\a` | The alert/bell character. |
| `\b` | The backspace character. |
| `\B` | A single `\` character. Equivalent to `\\`. |
| `\f` | Form feed. |
| `\t` | Horizontal tab. |
| `\v` | Vertical tab. |
| `\xy` | `xy` are octal digits that represent the character with the numeric value `xy`. |
| `\s` | Matches any whitespace. |
| `\S` | Matches any non-whitespace. |
| `\m`, `\M`, or `\y` | The boundary of a word. Equivalent to `\b` in normal regular expressions. |
| `*` | The star character. |

## Array Filters

A filter expression can use the functions `FOR_SOME()` and `FOR_ALL()` to apply a predicate against all values of an input array.

Array filter functions have the following rules:

- They can only evaluate array types.
- They can go on either the left or right side of a Boolean comparison expression, but not both sides at the same time.
- They must directly use a Boolean comparison operator.
- They cannot use the `SOME` and `ALL` SQL keywords.

### Filter Behavior with Empty Arrays

Array filter functions have unique behavior when evaluating empty arrays.

- `FOR_ALL()` evaluates an empty array as `TRUE`.
- `FOR_SOME()` evaluates an empty array as `FALSE`.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

If empty arrays must be evaluated for a different result, you can use the `ARRAY_LENGTH` function to specify a minimum array length. For example, this statement would evaluate an array as `TRUE` only if it is not empty and all values matched `%ocient%`:

```
SQL

ARRAY_LENGTH(array_col) > 0 AND FOR_ALL(array_col) LIKE '%ocient%
```

For details about array functions, see the **Array Functions and Operators** page.

### Filter Behavior with NULL rows

Filtering with array functions can yield different results depending on whether the array row is NULL or whether the values in the array are NULL.

If `FOR_SOME()` or `FOR_ALL()` evaluates a NULL row (the row itself is NULL, not that the array contains NULL values), then the result is always `FALSE`.

To check an array for the presence of NULL values, you must use the `IS NULL` operator. For example:

```
SQL

FOR_SOME(array_col) IS NULL
```

Array comparison operators, such as `@>`, `<@`, and `&&`, do not adhere to Boolean logic for NULL values. For details, see the **Array Functions and Operators** page.

## GROUP BY

Groups rows with the same values into summary rows, based on a specified aggregate function.

### Syntax

```sql
SELECT <select_list_clause> FROM table_name
    GROUP BY { column_name | expression | integer } [ , ... ]
    [ HAVING <filter_condition> ]
```

## Parameters

| Parameter | Description |
|---|---|
| `<select_list_clause>` | A list of one or more columns for the `SELECT` query.<br>To use `GROUP BY` to summarize the query result set, at least one of the columns in `column_list` must include an aggregate function, such as `SUM()`, `COUNT()`, or `MAX()`.<br>For a list of supported functions, see the **Aggregate Functions** page. |
| `table_name` | The table to use for the query. |
| `column_name` | The name of one or more columns to use to group the result set.<br>If you specify multiple columns, the result set is grouped by each unique combination of values from the columns. |
| `expression` | Any combination of literal values, column names, arithmetic expressions, parentheses, and function calls. |
| `integer` | An integer representing the position of the columns referenced in the `column_list`. The first position starts at `1`. |
| `<filter_condition>` | A `HAVING` clause that filters the aggregated groups based on a specified condition.<br>For details, see the **<filter_condition>** section. |

## Example

This example uses a movie database to calculate the total amount spent on movie production per year.

```sql
SELECT YEAR(release_date),
    SUM(budget)
FROM movies
GROUP BY 1
ORDER BY 1 ASC;
```

Output

| year(release_date) | sum(budget) |
|---|---|
| 1968 | 10500000 |
| 1979 | 31500000 |
| 1981 | 18000000 |
| 1982 | 28000000 |
| 1992 | 14000000 |
| 1997 | 200000000 |
| 2003 | 264000000 |
| 2009 | 237000000 |
| 2010 | 350000000 |
| 2012 | 670000000 |
| 2013 | 350000000 |
| 2015 | 414000000 |

## HAVING

Filters aggregated rows based on a specified condition.

`HAVING` operates in a `GROUP BY` statement by setting a filter for the rows to be aggregated and grouped.

For information on using `GROUP BY` in a query statement, see **GROUP BY**.

### Syntax

SQL

```
GROUP BY column_name HAVING <filter_condition>
```

### Parameters

| Parameter | Description |
| --- | --- |
| `column_name` | A column used for grouping that is evaluated by the `filter_condition`. |
| `<filter_condition>` | A logical combination of Boolean predicates.<br>For information on supported logical predicates, see **<filter_condition>**. |

### Example

This example calculates the total amount spent on movie production per year. The `HAVING` clause filters out any rows that do not have a sum of at least $100 million.

SQL

```
SELECT YEAR(release_date),
    SUM(budget)
FROM movies
GROUP BY 1
HAVING SUM(budget) > 100000000
ORDER BY 1 ASC;
```

Output

| year(release_date) | sum(budget) |
| --- | --- |
| 1997 | 200000000 |
| 2003 | 264000000 |
| 2009 | 237000000 |
| 2010 | 350000000 |
| 2012 | 670000000 |
| 2013 | 350000000 |
| 2015 | 414000000 |

## QUALIFY

Filters rows based on the results of window functions. The `QUALIFY` clause is analogous to `HAVING` for aggregate functions, except that `QUALIFY` filters rows after the system

computes the window functions.

The system evaluates the `QUALIFY` clause after the window functions but before the `DISTINCT` keyword and `ORDER BY` clause. The logical execution order is:

1. `FROM`
2. `WHERE`
3. `GROUP BY`
4. `HAVING`
5. `SELECT` (where the Ocient System computes the window functions)
6. `QUALIFY`
7. `DISTINCT`
8. `ORDER BY`
9. `LIMIT` and `OFFSET`

### Syntax

```SQL
<select_query>
QUALIFY <expression>
```

### Parameters

| Parameter | Description |
|---|---|
| `<select_query>` | A valid `SELECT` query that includes one or more window functions. |
| `<expression>` | A Boolean expression that references window function results. You can reference window function aliases or inline window expressions. |

### Examples

#### Top-N per Group

This example returns the top three highest-paid employees per department.

SQL

```sql
SELECT
    employee_id,
    department,
    salary,
    ROW_NUMBER() OVER (PARTITION BY department ORDER BY salary DESC) AS rn
FROM employees
QUALIFY rn <= 3
ORDER BY department, salary DESC;
```

Output

| employee_id | department | salary | rn |
|---|---|---|---|
| 105 | Engineering | 145000 | 1 |
| 102 | Engineering | 130000 | 2 |
| 110 | Engineering | 120000 | 3 |
| 201 | Marketing | 115000 | 1 |
| 204 | Marketing | 105000 | 2 |
| 207 | Marketing | 98000 | 3 |
| 301 | Sales | 125000 | 1 |
| 305 | Sales | 112000 | 2 |
| 308 | Sales | 108000 | 3 |

### Filter on a Running Aggregate

This example returns only rows where the running sum reaches at least 100.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

SQL

```sql
SELECT
    id,
    val,
    SUM(val) OVER (ORDER BY id) AS running_sum
FROM transactions
QUALIFY running_sum >= 100
ORDER BY id;
```

Output

| id | val | running_sum |
|---|---|---|
| 4 | 40 | 100 |
| 5 | 25 | 125 |
| 6 | 60 | 185 |

### Add Additional Filtering Using the `WHERE` Clause

Return rows where the value `val` is greater than 20. The `WHERE` clause filters rows before the system computes the window functions. The `QUALIFY` clause filters rows after the computation.

SQL

```sql
SELECT
    id,
    grp,
    val,
    ROW_NUMBER() OVER (PARTITION BY grp ORDER BY val DESC) AS rn
FROM my_table
WHERE val > 20
QUALIFY rn <= 1
ORDER BY grp;
```

Output

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| id | grp | val | rn |
|---|---|---|---|
| 3 | A | 85 | 1 |
| 7 | B | 72 | 1 |
| 12 | C | 90 | 1 |

### Rank Items Using the `DENSE_RANK` Function

This example ranks each row within each group and returns only the first two ranks.

SQL

```
SELECT
    grp,
    category,
    DENSE_RANK() OVER (PARTITION BY grp ORDER BY category) AS rnk
FROM my_table
QUALIFY rnk <= 2;
```

Output

| grp | category | rnk |
|---|---|---|
| A | alpha | 1 |
| A | alpha | 1 |
| A | beta | 2 |
| A | beta | 2 |
| B | alpha | 1 |
| B | alpha | 1 |
| B | gamma | 2 |
| B | gamma | 2 |
| C | beta | 1 |
| C | delta | 2 |
| C | delta | 2 |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

The `QUALIFY` clause cannot contain window functions inside the recursive member of a recursive common table expression (CTE).

## WINDOW

Defines one or more named window specifications that you can reference in window function `OVER` clauses within the same `SELECT` SQL statement. Named windows reduce repetition when multiple window functions share the same partitioning, ordering, or framing.

Place the `WINDOW` clause after the `QUALIFY` clause, if present, and before the `ORDER BY` clause.

### Syntax

SQL

```
<select_query>
WINDOW <window_name> AS ( [ <base_window_name> ]
    [ PARTITION BY <part_list> ]
    [ ORDER BY <order_list> [ ASC | DESC ] ]
    [ <frame_clause> ] )
    [ , <window_name> AS ( ... ) ... ]
```

### Parameters

| Parameter | Description |
|---|---|
| `<window_name>` | A name for the window specification. Use this name in `OVER` clauses to reference the window. Names are case-insensitive. |
| `<base_window_name>` | Optional. The name of another window that you define in the same `WINDOW` clause. The current window inherits the properties of the base window and can add non-conflicting clauses. |
| `<part_list>` | Optional. One or more columns by which to partition the rows. |
| `<order_list>` | Optional. One or more columns by which to order rows within each partition. |
| `<frame_clause>` | Optional. A `ROWS` or `RANGE` frame specification. For details, see **ROWS or RANGE**. |

### Reference a Named Window

You can reference a named window in an `OVER` clause in two ways.

### Examples

### Bare Named Window Reference

SQL

```
SELECT SUM(salary) OVER w
FROM employees
WINDOW w AS (PARTITION BY department ORDER BY hire_date);
```

### Parenthesized Named Window Reference

SQL

```
SELECT SUM(salary) OVER (w ORDER BY hire_date)
FROM employees
WINDOW w AS (PARTITION BY department);
```

The system returns an error if you specify a clause that the base window already defines. For example, you cannot add the `ORDER BY` clause when the base window already has this clause.

### Window Chaining

Named windows can reference other named windows, which lets you build up specifications incrementally.

SQL

```
SELECT SUM(salary) OVER w3
FROM employees
WINDOW w1 AS (PARTITION BY department),
       w2 AS (w1 ORDER BY hire_date),
       w3 AS (w2 ROWS BETWEEN UNBOUNDED PRECEDING AND CURRENT ROW);
```

You can reference a named window that you define later in the same `WINDOW` clause.

You cannot create a cyclic reference between named windows.

### Window Scope and Supported Query Contexts

A named window applies only within the `SELECT` SQL statement that defines it. Named windows are not visible inside subqueries, and a subquery cannot expose its named windows to the outer query.

You cannot reference a named window outside the `SELECT` statement that defines it.

Within that scope, named windows work in any context where a `SELECT` is valid:

- `SELECT` SQL statements
- `CREATE VIEW` and `CREATE OR REPLACE VIEW` statements
- `CREATE TABLE ... AS SELECT` (CTAS) statement
- `INSERT INTO ... SELECT` statement
- Subqueries and CTEs

### Examples

#### Use a Named Window with Multiple Functions

This example applies one named window to multiple functions to calculate row numbers and running aggregates within each department.

SQL

```sql
SELECT
    department,
    employee_name,
    salary,
    ROW_NUMBER() OVER w AS row_num,
    SUM(salary) OVER w AS running_sum,
    AVG(salary) OVER w AS running_avg
FROM employees
WINDOW w AS (PARTITION BY department ORDER BY salary DESC)
ORDER BY department, salary DESC;
```

Output

| department | employee_name | salary | row_num | running_sum |
|---|---|---|---|---|
| Engineering | Alice | 145000 | 1 | 145000 |
| Engineering | Bob | 130000 | 2 | 275000 |
| Engineering | Carol | 120000 | 3 | 395000 |
| Engineering | Frank | 115000 | 4 | 510000 |
| Engineering | Grace | 108000 | 5 | 618000 |
| ... | ... | ... | ... | ... |
| Marketing | Dana | 115000 | 1 | 115000 |
| Marketing | Eve | 105000 | 2 | 220000 |
| Marketing | Sam | 98000 | 3 | 318000 |
| ... | ... | ... | ... | ... |
| Sales | Zach | 125000 | 1 | 125000 |
| Sales | Amy | 112000 | 2 | 237000 |
| Sales | Ben | 108000 | 3 | 345000 |

### Chain Multiple Named Windows

This example chains three named windows to build a complex window specification incrementally. The `w_base` window partitions rows by department, the `w_ordered` window adds ordering by hire date, and the `w_framed` window adds a frame that runs from the first row to the current row. The query uses the `w_framed` window to calculate a running total of salary within each department, ordered by hire date.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

SQL

```sql
SELECT
    department,
    employee_name,
    salary,
    SUM(salary) OVER w_framed AS dept_running_total
FROM employees
WINDOW w_base AS (PARTITION BY department),
       w_ordered AS (w_base ORDER BY hire_date),
       w_framed AS (w_ordered ROWS BETWEEN UNBOUNDED PRECEDING AND CURRENT ROW)
ORDER BY department, hire_date;
```

Output

| department | employee_name | salary | dept_running_total |
|---|---|---|---|
| Engineering | Carol | 120000 | 120000 |
| Engineering | Frank | 115000 | 235000 |
| Engineering | Bob | 130000 | 365000 |
| Engineering | Grace | 108000 | 473000 |
| Engineering | Nancy | 105000 | 578000 |
| ... | ... | ... | ... |
| Marketing | Eve | 105000 | 105000 |
| Marketing | Dana | 115000 | 220000 |
| Marketing | Sam | 98000 | 318000 |
| ... | ... | ... | ... |
| Sales | Zach | 125000 | 125000 |
| Sales | Amy | 112000 | 237000 |
| Sales | Ben | 108000 | 345000 |

## ORDER BY

Sorts the result set in ascending or descending order based on one or more specified columns.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

If you specify multiple columns, they are sorted hierarchically from left to right.

### Syntax

SQL

```
ORDER BY { column_position | column_name } [ ASC | DESC ]
    [ NULLS FIRST | NULLS LAST ] [ , ... ]
```

### Parameters

| Parameter | Data Type | Description |
|---|---|---|
| `column_position` | Integer | The position of a column to be used for the `ORDER BY` sorting.<br>Column positions start at `1`. |
| `column_name` | String | The name of a column to be used for the `ORDER BY` sorting. |
| `ASC \| DESC` | String | Optional.<br>Specifies whether to sort the column in ascending ( `ASC` ) or descending ( `DESC` ) order.<br>If unspecified, defaults to `ASC`. |
| `NULLS FIRST \| NULLS LAST` | String | Optional.<br>`NULLS FIRST` means NULL values go at the start of the result set.<br>`NULLS LAST` means NULL values go at the end of the result set.<br><br>If unspecified, defaults to `NULLS FIRST`. |

### Example

In this example, the `ORDER BY` statement orders the movies from newest to oldest.

SQL

```
SELECT release_date, title
FROM movies
ORDER BY release_date DESC;
```

Output

| release_date | title |
|---|---|
| 2015-06-17 | Minnows |
| 2015-06-09 | Triassic World |
| 2015-04-01 | Fury 7 |
| 2013-11-27 | Frigid |
| 2013-04-18 | Iron Chef 3 |
| 2012-10-25 | Spyman 16 |
| 2012-07-16 | Superhero 23 |
| 2012-04-25 | The Tentpole |
| 2010-06-30 | The Last Airman |
| 2010-06-16 | Merchandise Vehicle 5 |

## LIMIT

Limits the number of returned rows from a query to a specified amount.

The returned rows are nondeterministic unless you use an **ORDER BY** clause.

### Syntaxes

### Limit Rows

```sql
<select_query> LIMIT limit_number
```

### Limit Rows per Group

```sql
<select_query> LIMIT limit_number PER ( <group_columns> [ ORDER BY <order_list> ] )
```

### Parameters

| Parameter | Description |
|---|---|
| `<select_query>` | A valid `SELECT` query. |
| `limit_number` | The number of rows to return from the query, specified as a positive integer or any constant scalar expression that evaluates to a positive integer. |
| `<group_columns>` | Optional. One or more columns that define groups. When you specify this parameter with the `PER` clause, the limit applies independently to each distinct combination of the grouping columns. |
| `<order_list>` | Optional. One or more columns that define the within-group ordering. This parameter determines which rows the database selects within each group. |

### Examples

#### Return the First Three Rows Using the `LIMIT` Clause

This example uses `LIMIT` to restrict the number of returned movie titles to only three.

```sql
SELECT title FROM movies LIMIT 3;
```

Output

SQL

```
Minnows
CGI Why
Billy the Killy
```

### Return a Calculated Number of Rows Using the `LIMIT` Clause

The `LIMIT` SQL statement can also accept expressions. This query uses the `1+2` expression with the `sys.dummy` table to create a table of three incrementing integers. For details, see **Generate Tables Using sys.dummy**.

SQL

```
SELECT c1 FROM sys.dummy10 LIMIT 1+2;
```

Output

SQL

```
1
2
3
```

### Return the Top N Rows per Group Using the `LIMIT` Clause

This example returns the top three salaries in each department. The `PER` clause extends the `LIMIT` clause to operate per group rather than globally.

SQL

```
SELECT id, department, salary
FROM employees
LIMIT 3 PER (department ORDER BY salary DESC);
```

Output

| id | department | salary |
|---|---|---|
| 201 | Marketing | 115000 |
| 204 | Marketing | 105000 |
| 207 | Marketing | 98000 |
| 105 | Engineering | 145000 |
| 102 | Engineering | 130000 |
| 110 | Engineering | 120000 |
| 301 | Sales | 125000 |
| 305 | Sales | 112000 |
| 308 | Sales | 108000 |

The query returns the top three highest-paid employees per department. The `ORDER BY salary DESC` clause inside the `PER` clause specifies within-group ordering. The inter-group ordering is nondeterministic because there is no outer `ORDER BY` clause.

### Return an Arbitrary Set of Rows per Group Using the `LIMIT` Clause

When you do not specify the `ORDER BY` clause inside the `PER` clause, the query returns an arbitrary set of N rows per group.

SQL

```
SELECT id, department, salary
FROM employees
LIMIT 5 PER (department);
```

Output

| id | department | salary |
|---|---|---|
| 308 | Sales | 108000 |
| 301 | Sales | 125000 |
| 305 | Sales | 112000 |
| 114 | Engineering | 100000 |

| id | department | salary |
|---|---|---|
| 109 | Engineering | 82000 |
| 108 | Engineering | 85000 |
| 104 | Engineering | 98000 |
| 111 | Engineering | 95000 |
| 209 | Marketing | 92000 |
| 212 | Marketing | 82000 |
| 213 | Marketing | 79000 |
| 214 | Marketing | 76000 |
| 201 | Marketing | 115000 |

The result contains five rows per department (or fewer if the department has fewer than five rows total). Both the rows selected and their order are nondeterministic.

### Return Rows per Group Using Multiple Grouping Columns

You can specify multiple columns for grouping.

SQL

```
SELECT id, region, department, salary
FROM employees
LIMIT 2 PER (region, department ORDER BY salary DESC);
```

Output

| id | region | department | salary |
|---|---|---|---|
| 301 | West | Sales | 125000 |
| 305 | West | Sales | 112000 |
| 209 | West | Marketing | 92000 |
| 210 | West | Marketing | 88000 |
| 201 | East | Marketing | 115000 |
| 204 | East | Marketing | 105000 |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| id | region | department | salary |
|---|---|---|---|
| 114 | West | Engineering | 100000 |
| 104 | West | Engineering | 98000 |
| 308 | East | Sales | 108000 |
| 105 | East | Engineering | 145000 |
| 102 | East | Engineering | 130000 |

### Order the Final Result Using an Outer `ORDER BY` Clause

This example returns the top three salaries per department using the `LIMIT ... PER` clause, then sorts the combined result by department and descending salary using an outer `ORDER BY` clause. The `ORDER BY` clause inside the `PER` clause controls which rows the database selects within each group. An outer `ORDER BY` clause controls the final result ordering.

SQL

```sql
SELECT id, department, salary
FROM employees
LIMIT 3 PER (department ORDER BY salary DESC)
ORDER BY department, salary DESC;
```

Output

| id | department | salary |
|---|---|---|
| 105 | Engineering | 145000 |
| 102 | Engineering | 130000 |
| 110 | Engineering | 120000 |
| 201 | Marketing | 115000 |
| 204 | Marketing | 105000 |
| 207 | Marketing | 98000 |
| 301 | Sales | 125000 |
| 305 | Sales | 112000 |

© 2026 Ocient, Inc Ocient Proprietary and Confidential

| id | department | salary |
|---|---|---|
| 308 | Sales | 108000 |

## FETCH

Limits the number of returned rows from a query. This is an alternative to the **LIMIT** clause.

The query returns rows in nondeterministic order unless you use an **ORDER BY** clause.

> You can use `FETCH FIRST` and `FETCH NEXT` interchangeably. The system accepts both `ROW` and `ROWS` regardless of the value of `limit_number`.

### Syntax

SQL

```
<select_query> FETCH { FIRST | NEXT } [ limit_number ] { ROW | ROWS } [ ONLY ]
```

### Parameters

| Parameter | Description |
|---|---|
| `<select_query>` | A valid `SELECT` query. |
| `limit_number` | Optional. The number of rows to return from the query, specified as a positive integer. The default value is `1`. |

### Examples

#### Fetch First Three Rows

This example uses `FETCH FIRST` to restrict the number of returned movie titles to only three.

SQL

```
SELECT title FROM movies FETCH FIRST 3 ROWS ONLY;
```

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

Output

```
Minnows
CGI Why
Billy the Killy
```

### Fetch First Row (Default)

If you omit `limit_number`, `FETCH FIRST ROW ONLY` returns a single row.

```
SELECT title FROM movies FETCH FIRST ROW ONLY;
```

Output

```
CGI Why
```

## OFFSET

Skips a specified number of rows from the result set.

The returned rows are nondeterministic unless you use an **ORDER BY** clause.

### Syntaxes

### Skip Rows

```
<select_query> OFFSET offset_number
```

### Skip Rows per Group

```sql
<select_query> OFFSET offset_number PER ( <group_columns> [ ORDER BY <order_list> ]
```

## Parameters

| Parameter | Description |
|---|---|
| `<select_query>` | A valid SELECT query. |
| `offset_number` | The number of rows to skip when returning results from the query, specified as a positive integer or any constant scalar expression that evaluates to a positive integer. |
| `<group_columns>` | Optional. One or more columns that define groups. When you specify this parameter with the `PER` clause, the offset applies independently to each distinct combination of the grouping columns. |
| `<order_list>` | Optional. One or more columns that define the within-group ordering. This parameter determines which rows the system skips within each group. |

## Examples

### Skip the Six Oldest Rows Using the `OFFSET` Clause

In this example, the `ORDER BY` statement orders the results chronologically. As a result, the `OFFSET` clause removes the oldest six movies from the result set.

```sql
SELECT release_date,
    title
FROM movies
ORDER BY release_date OFFSET 6;
```

Output

| release_date | title |
|---|---|
| 2003-07-09 | Pirates of Palm Springs |
| 2003-10-10 | Billy the Killy |

| release_date | title |
|---|---|
| 2003-12-01 | Swords & Scabbards |
| 2009-12-10 | CGI Why |
| 2010-06-16 | Merchandise Vehicle 5 |
| 2010-06-30 | The Last Airman |
| 2012-04-25 | The Tentpole |
| 2012-07-16 | Superhero 23 |
| 2012-10-25 | Spyman 16 |
| 2013-04-18 | Iron Chef 3 |
| 2013-11-27 | Frigid |
| 2015-04-01 | Fury 7 |
| 2015-06-09 | Triassic World |
| 2015-06-17 | Minnows |

### Skip a Calculated Number of Rows Using the `OFFSET` Clause

The `OFFSET` clause can also accept expressions. This query uses the expression `3+4` with the `sys.dummy` table to create a column of incrementing integers by skipping the first seven out of 10 rows. For details, see **Generate Tables Using sys.dummy**.

SQL

```
SELECT c1 FROM sys.dummy10 OFFSET 3+4;
```

Output

SQL

```
8
9
10
```

### Paginate Within Each Group Using the `OFFSET` and `LIMIT` Clauses

This example skips the five highest salaries in each department, then returns the next five, producing the second page of a five-row-per-page pagination within each department. The `PER` clause extends the `OFFSET` clause to skip rows per group rather than globally. Combine the `OFFSET ... PER` clause with the `LIMIT ... PER` clause to paginate within each group.

SQL

```sql
SELECT id, department, salary
FROM employees
OFFSET 5 PER (department ORDER BY salary DESC)
LIMIT 5 PER (department ORDER BY salary DESC);
```

Output

| id | department | salary |
|---|---|---|
| 113 | Engineering | 105000 |
| 114 | Engineering | 100000 |
| 104 | Engineering | 98000 |
| 115 | Engineering | 97000 |
| 111 | Engineering | 95000 |
| 211 | Marketing | 85000 |
| 212 | Marketing | 82000 |
| 213 | Marketing | 79000 |
| 214 | Marketing | 76000 |

This query returns rows six through ten for each department, ordered by salary in descending order. This result is the second page of results, where each page contains five rows per department. Marketing has only nine employees, so only four rows appear for that department. Sales has only three employees, so `OFFSET 5` skips past all of them and returns no Sales rows.

## INTERSECT

Returns any rows that match between two separate `SELECT` queries. To use `INTERSECT`, the two queries must be compatible, meaning they must return the same number of columns and have similar data types.

By default, the SQL statement eliminates duplicate rows unless the query includes the optional `ALL` keyword. Using the `DISTINCT` keyword is the same as this default behavior.

### Syntax

SQL

```
<select_query1> INTERSECT [ ALL | DISTINCT ] <select_query2>
```

### Parameters

| Parameter | Description |
| --- | --- |
| `<select_query1>` | A valid SELECT query. |
| `<select_query2>` | A valid SELECT query. |

### Example

This example has two `SELECT` queries with an `INTERSECT` statement. The full query retrieves movies that had a budget of at least $200million, butalsoearnedmorethan$ 200million, butalsoearnedmorethan1 billion in revenues.

SQL

```
SELECT *
FROM movies
WHERE revenue > 1000000000
INTERSECT
SELECT *
FROM movies
WHERE budget > 20000000;
```

Output

| movie_id | title | budget | popularity | release_date |
|---|---|---|---|---|
| 597 | Titania | 200000000 | 100.025899 | 1997-11-18 |
| 19995 | CGI Why | 237000000 | 150.437577 | 2009-12-10 |
| 49026 | Superhero 23 | 250000000 | 112.31295 | 2012-07-16 |
| 10193 | Merchandise Vehicle 5 | 200000000 | 59.995418 | 2010-06-16 |
| 211672 | Minnows | 74000000 | 875.581305 | 2015-06-17 |
| 122 | Swords & Scabbards | 94000000 | 123.630332 | 2003-12-01 |
| 37724 | Spyman 16 | 200000000 | 93.004993 | 2012-10-25 |
| 109445 | Frigid | 150000000 | 165.125366 | 2013-11-27 |
| 168259 | Furious 7 | 190000000 | 102.322217 | 2015-04-01 |
| 68721 | Iron Chef 3 | 200000000 | 77.68208 | 2013-04-18 |
| 135397 | Triassic World | 150000000 | 418.708552 | 2015-06-09 |
| 24428 | The Tentpole | 220000000 | 144.448633 | 2012-04-25 |

## EXCEPT

The `EXCEPT` keyword returns the result set of a first `SELECT` query minus any matching rows from a second `SELECT` query.

`EXCEPT` requires the two queries to be compatible, meaning they must return the same number of columns and have similar data types. By default, the result set eliminates duplicate rows unless the query includes the optional `ALL` keyword. Using the `DISTINCT` keyword is the same as this default behavior.

The `EXCEPT` keyword can also be used to exclude specific columns from a `SELECT *` query. For information on that alternate usage, see the **SELECT** syntax and example.

### Syntax

SQL

```
<select_query1> EXCEPT [ ALL | DISTINCT ] <select_query2>
```

### Parameters

| Parameter | Description |
| --- | --- |
| `<select_query1>` | A valid SELECT query that is compared to `select_query2`.<br>The results of an EXCEPT statement are the rows in `select_query1` that do not match any row in `select_query2`. |
| `<select_query2>` | A valid SELECT query that is compared to `select_query1`. |

### Example

In this example, the first `SELECT` statement queries all rows in the `movies` table. The `EXCEPT` clause and the second `SELECT` statement eliminate from the results any rows with movies that had a budget greater than `20000000`.

SQL

```sql
SELECT *
FROM movies
EXCEPT
SELECT *
FROM movies
WHERE budget > 20000000;
```

Output

| title | budget | popularity | release_date | revenue |
| --- | --- | --- | --- | --- |
| Bang Bang Western | 14000000 | 37.380435 | 1992-08-07 | 159157447 |
| Space Odyssey 6000 | 10500000 | 86.201184 | 1968-04-10 | 68700000 |
| Raiders of the Jungle Temple | 18000000 | 68.159596 | 1981-06-12 | 389925971 |

## UNION

Returns the combined result set of two or more `SELECT` queries.

By default, `UNION` eliminates duplicate rows from the result set unless you specify the `ALL` keyword. Using the `DISTINCT` keyword is the same as this default behavior.

### Syntax

SQL

```
<select_query1> UNION [ ALL | DISTINCT ] <select_query2> [ ... ]
```

### Parameters

| Parameter | Data Type | Description |
|---|---|---|
| `select_query1` | String | A valid `SELECT` query that is combined with `select_query2`. |
| `select_query2` | String | A valid `SELECT` query that is combined with `select_query1`. |

### Example

This example uses `UNION` to merge two separate queries for identical columns into the same result set.

SQL

```
SELECT title,
    popularity,
    vote_average
FROM movie
WHERE popularity > 800
UNION
SELECT title,
    popularity,
    vote_average
FROM movies.movie
WHERE vote_average > 7.5;
```

Output

| title | popularity | vote_average |
|---|---|---|
| Raiders of the Jungle Temple | 68.159596 | 7.7 |
| Minnows | 875.581305 | 6.4 |
| Apocalypse None | 49.973462 | 8 |
| Superhero 23 | 112.31295 | 7.6 |
| Billy the Killy | 79.754966 | 7.7 |
| Bang Bang Western | 37.380435 | 7.7 |
| Blade Walker | 94.056131 | 7.9 |
| Swords & Scabbards | 123.630332 | 8.1 |
| Merchandise Vehicle 5 | 59.995418 | 7.6 |
| Space Odyssey 6000 | 86.201184 | 7.9 |

## USING

Overrides various system configurations for processing a specified query.

The `USING` keyword is required for only the first query override, not for subsequent ones.

For descriptions of the supported query configurations, see the parameter table below.

### Syntax

SQL

```
<select_query>
USING
    [ SCHEDULING_PRIORITY = priority_value ]
    [ MAX_ROWS_RETURNED = max_rows ]
    [ MAX_ELAPSED_TIME = max_elapsed_time ]
    [ MAX_TEMP_DISK_USAGE = max_temp_disk_usage ]
    [ CACHE_MAX_TIME = cache_max_time ]
    [ CACHE_MAX_BYTES = cache_max_bytes ]
    [ SERVICE CLASS service_class ]
```

### Parameters

| Parameter | Description |
| --- | --- |
| `<select_query>` | A valid `SELECT` query. |
| `priority_value` | An optional clause that specifies the priority at which the query should run. The priority value is a floating-point number, which indicates the priority compared to the other queries. The priority value does not specify any percentage of resources that the query takes or any specific degree of difference between queries.<br>If unspecified, defaults to `SCHEDULING_PRIORITY = 1.0`. |
| `max_rows` | An optional clause that limits the number of rows returned by a query. If a query exceeds this number of rows, the system kills it.<br>For example, `max_rows_returned = 10` kills any queries returning more than ten rows. |
| `max_elapsed_time` | An optional clause that limits how long a query can run. If a query exceeds this time limit in seconds, the system kills it.<br>For example, `max_elapsed_time = 10` kills any queries taking longer than 10 seconds. |
| `max_temp_disk_usage` | An optional clause that limits the percentage of temporary disk used by a query. If a query exceeds this temporary disk limit, the system kills it.<br>For example, `max_temp_disk_usage = 10` kills any queries taking more than 10% of temporary disk space. |
| `cache_max_time` | An optional clause that affects whether a specified query uses results from the cache rather than executing the query. If there is a cached result with the same query text, executed less than `cache_max_time` seconds ago, the database uses that cached result. The default value is 0, and thus by default, the database does not return any cached results.<br>The cache considers all SQL Nodes, and if a potential cached result is only available on a different SQL Node, the database redirects the query to that node. If you specify the force attribute on the connection, which disables load balancing and redirection, the database considers only cached results on the current node. |
| `cache_max_bytes` | An optional clause that controls whether the database stores the results of any specified query in the cache. The system stores the results of all queries executed using a service class specifying this attribute in the cache if the result size is smaller than this value. You can determine the size of a result set in bytes by querying the `bytes_returned` field of the `completed_queries` virtual table. The default value is 0, and thus by default, the database does not cache any results.<br>The database caches results in memory on the SQL Nodes. These results are not cached if there is insufficient memory available. |
| `service_class` | An optional clause at the end of a query that sets a specific service class to run that query. The user must have access to the service class through a group assignment or a `USE` privilege grant. For details, see **CREATE SERVICE CLASS** and **Service Class Privileges**. |

### Example

```SQL
SELECT * FROM sys.dummy10
USING
    SCHEDULING_PRIORITY = 1.0
    MAX_ROWS_RETURNED = 10
    MAX_ELAPSED_TIME = 10
    MAX_TEMP_DISK_USAGE = 10;
```

Output

```SQL
c1
-----------
1
2
3
4
5
6
7
8
9
10
```

## TRACE

An optional clause that executes the query, but discards the original result set. Instead, `TRACE` returns a result set of tracing data that describes the execution of the query.

Append the `TRACE` SQL statement to the end of a query. The statement can include optional parameters to control its frequency and level of detail.

To understand the results of this statement, see **TRACE Results**.

> Trace queries have the same effect on the workload as a query executed without the clause.

⚠ Contact Ocient Support for guidance in using the TRACE SQL statement.

### Syntax

```SQL
<select_query> TRACE
    [ FREQUENCY frequency_int ]
    [ RESOLUTION resolution_int ]
```

### Parameters

| Parameter | Description |
|---|---|
| `<select_query>` | A valid `SELECT` query. |
| `frequency_int` | Controls how often the database samples trace events during query execution in milliseconds.<br>If unspecified, defaults to 500 milliseconds. |
| `resolution_int` | Determines the level of detail captured for a trace or event.<br>If the resolution of a trace is greater than the resolution of an event, the database records the event.<br>If unspecified, defaults to 100 milliseconds. |

## TRACE Results

Each row of the trace output provides some information about what an operator instance has done in the time between the previous trace sample and the most current sample.

| Column | Description |
|---|---|
| `plan_parent_id` | The UUID of the parent of the operator instance in the query plan. If an operator has multiple parents, this field specifies the UUID of one of the parents. |
| `plan_op_id` | The UUID of the operator in the query plan. |
| `operator_type` | The type of operator that the database uses to sample trace events. |
| `node_id` | The UUID of the node where this operator executes. |
| `code_id` | The identifier of the VM core where this operator instance executes. Core identifiers are unique for each node. |

© 2026 Ocient, Inc

| Column | Description |
| --- | --- |
| `op_id` | The identifier of the operator instance. Identifiers are unique for each node. |
| `time` | The time in milliseconds when the database collects the information for the trace event relative to the start of the query. |
| `group` | Group related trace events together. |
| `sample` | The sample of trace event data. For possible values, see the following table. |
| `value` | The value of trace event data. |

### Sample and Value Columns

The `sample` and `value` columns describe what occurred in a specified trace period.

| Sample | Description |
| --- | --- |
| `ROWS_IN` | The number of rows an operator instance has read from its children operators. |
| `ROWS_OUT` | The number of rows the operator instance returns. |
| `BLOOM_FILTERED_ROWS` | The number of rows that this operator instance discards by using Bloom filters. |
| `SCHEDULE_CYCLE` | The number of cycles in the schedule for this operator instance. |
| `OOM_CYCLE` | The number of out-of-memory cycles in the schedule for this operator. |
| `INITIALIZE` | The time when the database initializes the operator. |
| `FINALIZE` | The time when the database finalizes the operator. |

### Example

SQL

```
SELECT * FROM sys.dummy10 TRACE;
```

Output

| plan_parent_id | plan_op_id | operator_type | node_id | core_id |
|---|---|---|---|---|
| 77041d2b-f7ca-49d5-a3f5-4b75b0782ed1 | 498690cf-4a9b-4c1f-affa-417f31fddc2d | RENAME_OPERATOR | 08ca7b05-1e4d-455f-9f46-2174ed048d33 | 4 |
| 77041d2b-f7ca-49d5-a3f5-4b75b0782ed1 | 498690cf-4a9b-4c1f-affa-417f31fddc2d | RENAME_OPERATOR | 08ca7b05-1e4d-455f-9f46-2174ed048d33 | 4 |
| 77041d2b-f7ca-49d5-a3f5-4b75b0782ed1 | 498690cf-4a9b-4c1f-affa-417f31fddc2d | RENAME_OPERATOR | 08ca7b05-1e4d-455f-9f46-2174ed048d33 | 4 |

## TAG

An optional clause that adds one or more tags to the SQL query. You can also add tags to a common table expression in the `WITH` clause. After you define tags, you can find them in the `sys.queries` and `sys.completed_queries` system catalog tables.

### Syntax

SQL

```
<select_query> <tag> [ ... ]

<tag> ::= TAG <tag_identifier>
```

### Parameters

| Parameter | Description |
|---|---|
| `<select_query>` | A valid `SELECT` query. |
| `tag_identifier` | Identifier of the tag for the query. Enclose the identifier in double quotes if it contains any special characters, such as spaces. |

### Examples

### SQL Query with One Tag

Select the count of a table with one row and tag the query with the name `count1`.

```sql
SELECT COUNT(*) FROM sys.dummy1 TAG count1;
```

### SQL Query with Multiple Tags

Select the device model and tag this query with two names `device_model` and `phones`.

```sql
SELECT device_model
FROM system.adtech_flat
LIMIT 1
TAG device_model
TAG phones;
```

### Common Table Expression with One Tag

Define a common table expression with the `average_budget` tag. You can also add another tag for the whole query `overall_budget`.

```sql
WITH avg_budget_table (average_budget) AS (
    SELECT AVG(budget)
    FROM movies
    TAG average_budget
)
SELECT title,
    budget,
    revenue
FROM movies,
    avg_budget_table
WHERE budget > avg_budget_table.average_budget
TAG overall_budget;
```

## String Literals and Escape Sequences

All string literals in SQL statements must be enclosed in single quotes. To use a single quote within a string, you can use another single quote as an escape, `''`*. *

For other escape sequences, include an `e` character before the string literal, i.e., before the opening single quote. This directs the system to recognize escape sequences in the string literal. This means:

- All single `\` characters in the string now escape themselves.
- Any subsequent character after the `\` is also escaped if it matches an escape sequence (see the table).

If you use escape sequences, be prepared that you might need to alter strings that include `\`, such as directory paths.

### Supported Escape Sequences

| Escape Sequence | Description |
|---|---|
| `''` | Single quotation mark |
| `\"` | Double quotation mark |
| `\n` | Newline character |
| `\r` | Carriage return character |
| `\f` | Form feed character (i.e., page break) |
| `\b` | Backspace |
| `\\` | Backslash |
| `\t` | Tab |
| `\o`, `\oo`, `\ooo` | An octal byte value, where `o` is an integer from 0 to 7. If the value exceeds one byte (octal 377), the system uses two bytes. |
| `\xh`, `\xhh` | A hexadecimal byte value, where `h` is a character from 0–9 or a–f. |
| `\uxxxx` | A 16-bit hexadecimal Unicode character value, where `x` is a character from 0–9 or a–f. |
| `\Uxxxxxxxx` | A 32-bit hexadecimal Unicode character value, where `x` is a character from 0–9 or a–f. |

The `\o`, `\oo`, `\ooo` and `\xh`, `\xhh` escape sequences specify raw UTF-8 bytes, not Unicode code points. To represent multi-byte UTF-8 characters using these sequences, you must provide each byte separately (e.g., `e'\xc3\xa9'` for é). For Unicode code points, use `\uxxxx` or `\Uxxxxxxxx` instead. String literals containing invalid UTF-8 byte sequences result in a syntax error.

© 2026 Ocient, Inc

The `\'` escape sequence is not supported in e-strings. Use `''` to include a single quote within an e-string.

### Examples

These examples show how the system interprets strings with and without escape sequences.

#### String Without an Escape Sequence

This example selects the simple string literal `'\my\directory\path'` that does not use escape sequences.

```
SQL
SELECT '\my\directory\path';
```

*Output: * `\my\directory\path`

#### String With an Escape Sequence

This example selects the simple string literal `'\my\directory\path'` and uses an escape sequence. The result omits the backslashes.

```
SQL
SELECT e'\my\directory\path';
```

*Output: * `mydirectorypath`

#### String With an Escape Sequence to Retain the Backslashes

This example uses the `'\\my\\directory\\path'` string with an escape sequence to include backslashes in the result.

```
SQL
SELECT e'\\my\\directory\\path';
```

© 2026 Ocient, Inc

*Output: * `\my\directory\path`

### Escape Sequences with Regular Expressions

> Be careful using escape sequences with strings that also use regular expressions. Escape sequences in SQL syntax override those in regular expressions.

In this example, the **REGEXP_SUBSTR** function uses the regular expression `\w+` to match any word characters.

SQL

```
SELECT REGEXP_SUBSTR(
    'abcdefghijklmnopqrstuvwxyz',
    '\w+'
    );
```

*Output: * `abcdefghijklmnopqrstuvwxyz`

The function behaves differently if the regular expression is an escape sequence because it overrides the `\` character. The regular expression searches only for the character `w`.

SQL

```
SELECT REGEXP_SUBSTR(
    'abcdefghijklmnopqrstuvwxyz',
    e'\w+'
    );
```

*Output: * `w`

### Octal Escape Sequence

This example uses an octal escape sequence to produce the letter `A` (octal 101).

SQL

```
SELECT e'\101';
```

*Output: * `A`

### Hexadecimal Escape Sequence

This example uses hexadecimal escape sequences to produce the character é (UTF-8 bytes `\xc3\xa9`).

```
SQL
SELECT e'\xc3\xa9';
```

*Output: * `é`

### Unicode Escape Sequence

This example uses a 16-bit Unicode escape sequence to produce the character é (U+00E9).

```
SQL
SELECT e'\u00e9';
```

*Output: * `é`

### 32-bit Unicode Escape Sequence

This example uses a 32-bit Unicode escape sequence to produce an emoji (U+1F600).

```
SQL
SELECT e'\U0001f600';
```

*Output: * `😀`

# Join Operations

Understand how Ocient executes SQL JOIN operations, including hash and product joins, memory considerations, and best practices for query performance.

Join operations in the Ocient® System deliver high performance without requiring manual fine-tuning of queries and tables. This topic explains how the Ocient System handles joins to help you better understand performance characteristics and make informed design choices.

For syntax and information about supported join types, see the **JOIN** reference.

## Join Optimization in Ocient

Before starting any join operation, the Ocient System automatically determines the optimal plan for combining tables. The system determines the best order for joining tables to reduce processing and storage demands while increasing performance. This process includes:

- **Optimizing I/O with Early Filtering** — The execution engine uses various techniques to dynamically reduce input and output (I/O) for join operations by filtering unneeded values.
- **Determining join order** — The optimizer automatically reorders tables for efficiency, usually from smallest to largest in terms of row count, regardless of how you order tables in the SQL statement.
- **Selecting the join strategy** — The system can override user-specified join types with more performant alternatives. For example, the system can convert an `OUTER JOIN` to an `INNER JOIN` when the result remains semantically equivalent.

As a result, you generally do not need to fine-tune `JOIN` queries or configure table definitions to designate a specific table order. The optimizer ensures efficient execution plans even if you do not specify optimal table or join conditions.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

Join performance does not generally benefit from other table configurations for query optimization, such as TimeKey®, Clustering Keys, secondary indexes, or compression.

# How Ocient Joins Tables

The Ocient System executes all `JOIN` operations within SQL statements as either hash or product joins:

### Hash Joins

- The system uses hash joins automatically whenever your `JOIN` predicate includes at least one equality comparison (e.g., `ON a.column_1 = b.column_2`).
- The system splits and shuffles data so the hash join executes in parallel. This shuffling enables great scalability and performance, even with large tables.

### Product Joins

- If your `JOIN` predicate does not include an equality condition, the system uses a product join (a cartesian join with a filter). For example, the `JOIN` predicate `ON a.column_1 > b.column_2` uses a product join because it is not an equality condition.
- In a product join, the system broadcasts the smaller table of the join to all compute nodes, and then compares every row according to your condition.
- Product joins perform more slowly when operating on large tables, so it is generally better to use an equality comparison in your `JOIN` SQL statements when possible.

# Join Storage Considerations

The performance of SQL join operations is limited by the available system memory, specifically the size of the huge pages configured on the server. During the execution of hash joins, the system typically loads the smaller table of the join into memory.

### Spill to Disk

If the memory required for the join operation exceeds what is physically available, the system spills intermediate data to disk, utilizing swap or temporary files. This reliance

on disk I/O can significantly degrade query performance compared to in-memory processing, but it ensures that the system can complete the query without failure.

#### Temporary Storage Requirements

When intermediate results or hash tables exceed available memory, the join operation adjusts to using temporary disk space approximately equal to the combined sizes of the participating tables (both the build and probe sides).

#### Resource Contention

Because joins are resource-intensive, heavy join workloads can affect overall system throughput and potentially impact the performance of concurrent queries, particularly in systems without strict workload management configurations.

# Join Best Practices

These best practices help you design join queries that balance performance, scalability, and maintainability. While the Ocient optimizer handles most join operations automatically, applying these techniques can further reduce overhead and improve query efficiency. Many of these tips are common for OLAP database administration and reflect proven approaches across analytical systems.

## Moderate Denormalization

In columnar analytical databases, moderate denormalization is a recommended best practice. This denormalization means selectively embedding low-cardinality, frequently used dimension attributes into a fact table to reduce the number of joins. For example, duplicating a product category column in a sales fact table can remove the need for a separate join to the product dimension, while still leaving high-cardinality tables normalized.

Small dimension tables (less than one million rows) can also benefit from Global Dictionary Compression (GDC). With GDC, the system can share dictionaries across tables, improving both performance and storage efficiency.

## Query Design Considerations

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

Beyond general join strategies, small design choices in your SQL statements can impact performance significantly. These practices help ensure that the optimizer can make efficient decisions and avoid unnecessary overhead during execution.

### Use Window Aggregate Functions Instead of Self-Joins

In many cases, window aggregate functions can replace self-joins, especially for time period comparisons.

### Window Aggregate Example (Most Performant)

In this example, the `LAG` function retrieves the revenue from the previous month within the same result set, allowing you to calculate month-over-month changes without requiring a self-join.

SQL

```sql
SELECT
    month,
    revenue,
    LAG(revenue) OVER (ORDER BY month) AS prior_month_revenue,
    revenue - LAG(revenue) OVER (ORDER BY month) AS month_change
FROM monthly_sales;
```

You can obtain the same results by using a self-join statement in a query, but this is less efficient.

### Self-Join Example (Less Performant)

The query scans the `monthly_sales` table twice, once as `curr` and again as `prev`. This approach produces the same result as the window function but requires more overhead.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

SQL

```sql
SELECT
    curr.month,
    curr.revenue,
    prev.revenue AS prior_month_revenue,
    curr.revenue - prev.revenue AS month_change
FROM monthly_sales curr
JOIN monthly_sales prev
    ON curr.month = prev.month + INTERVAL '1' MONTH;
```

### Match Data Types for Join Keys

Always ensure that join keys share the same data type. Mismatched types force the system to apply implicit type conversions, which can slow down execution and interfere with query optimization.

### Materialize Calculations Before Joins

Avoid using functions or expressions directly in join conditions. If you apply a calculation at join time (for example, casting a TIMESTAMP to a DATE), the system must evaluate that function for every row, which can result in losing the ability to use statistics or efficient hash keys. A better method is to pre-compute the value and store it as a separate column during loading or as part of a staging step. This approach reduces per-row processing costs and keeps joins predictable.

### Materializing Calculations Example

Materializing calculations before joins using a common table expression separates data transformation from the join itself, so the join operates on clean, precomputed keys. This approach reduces workload during the join, enables better use of indexes and statistics, and yields simpler, more predictable query plans.

SQL

```sql
WITH summarized AS (
    SELECT customer_id, SUM(purchase_amount) AS total_spent
    FROM purchases
    GROUP BY customer_id
)
SELECT c.region, s.total_spent
FROM customers c
JOIN summarized s
    ON c.customer_id = s.customer_id;
```

# SQL Syntax Conventions

SQL syntax conventions used in Ocient documentation, including notation for required, optional, repeating elements, identifiers, literals, and reserved words.

## Syntax Conventions

The Ocient® documentation uses the following conventions for defining SQL statements in syntax blocks, unless otherwise noted.

| Syntax Symbol | Definition | Example |
|---|---|---|
| KEYWORD | SQL statement names, SQL statement option names, stored procedure names, utility names, utility flags, and other SQL keywords are in uppercase. | `SELECT * FROM <my_table> LIMIT 100;` SELECT, FROM, and LIMIT are all SQL keywords. For that reason, they are in uppercase. |
| `{}` | Curly braces indicate that you must choose at least one of the enclosed options. Do not include the curly braces in your SQL statement. | `INSERT INTO table_name [( col1 [, col2 ] [,...] ) ] \{ \<select_statement> \| VALUES ( [ val1 [, val2] [,...] ) }` This syntax example has two options to define what data to add using `INSERT INTO`: either provide specific values or use an embedded `SELECT` query. These options are enclosed in curly braces because the user must use one of these options to successfully run an `INSERT INTO` SQL statement. |
| `[]` | Brackets mean the enclosed functionality is optional, not necessary to run the specified SQL statement. Do not include the brackets in your SQL query. When used with a list of options, the brackets mean that you can choose one of the listed options. | `CREATE CLUSTER [ IF NOT EXISTS ] cluster_name ( \<create_definition> [, ...] )` This syntax example encloses `IF NOT EXISTS` in brackets because it is optional for running the `CREATE CLUSTER` SQL statement. |
| `\|` | The vertical pipe acts as a delimiter for option lists, meaning you can select only one of the options. | `EXPLAIN [ PROTO \| JSON \| DEBUG ] \<query>` This example shows three options that the `EXPLAIN` SQL statement can use. The vertical pipe indicates that each option is exclusive, meaning only one can be used. |
| `[ , ... ]` | The ellipsis means you can choose to add as many of the indicated options or parameters | `INSERT INTO <table_name> [ ( <column_name> [, ...] ) ] <query>` The INSERT INTO statement uses the ellipsis |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Syntax Symbol | Definition | Example |
| --- | --- | --- |
| | as you like, separating your choices with commas to be typed as part of the SQL statement. | `[, ...]` to indicate that an infinite number of additional `<column_name>` values can be specified. |
| `<syntax_subsection>` | For complex syntax blocks, portions are set apart with angle brackets `<>` to denote there is a separate subsection for a particular portion of the syntax. Syntax blocks with these subsections usually include complicated options that might distract from the core functionality of the syntax of the SQL statement.<br>The names of syntax subsection are written in lowercase with underscores between the words. In the syntax block, the `::=` symbol signifies the subsection. | `CREATE TABLE [ IF NOT EXISTS \| OR REPLACE ] table_name [ (\<create_definition> [, ...] ) ] [ [ WITH ] \<create_option> [, ... ] ] [ AS (query) ]`<br><br>`\<create_definition> ::= \ <column_definition> \| \<index_definition>`<br><br>`\<create_option> ::= STORAGESPACE storage_space_name \| SEGMENTSIZE segment_value \| REDUNDANCY segment_part (redundancy_scheme) \| STREAMLOADER_PROPERTIES streamloader_json \| CLUSTERING [KEY \| INDEX] clustering_index (clustering_column [, ...]) \| INDEX index_name (index_column [, ...]) [ USING index_type ]`<br><br>`\<column_definition> ::= column_name [ data_type ] [ \<column_constraint> [, ...] ]`<br><br>`\<index_definition> ::= [ CLUSTERING ] KEY index_name (index_column [, ...] )`<br><br>`\<column_constraint> ::= TIME KEY BUCKET(bucket_value [, DAY, HOUR, MINUTE, SECOND ]) \| [ NOT ] NULL \| DEFAULT literal \| COMMENT comment \| COMPRESSION GDC [(compression_value), EXISTING schema_name] \| MAX SIZE (size_value) \| [ NO ] COMPRESSION [ compression_scheme ]`<br><br>In this example, CREATE TABLE uses subsections for complex options, such as its column definition, options, and column constraints. Including all of these in one block would be difficult for a user to parse, especially if their goal was only to create a basic table.<br>Note that each subsection is defined with the name of the subsection in angle brackets followed by `::=`. |

For the definition of a function syntax, the text refers to input arguments of the function as arguments. For the definition of SQL statements, such as DDL statements, the text refers to input terms as parameters.

## Rules for Column and Table Names

Names for tables and columns in Ocient have these rules:

- Names must begin with an alphabet letter.
- Names can contain letters, numbers, and underscores.
- Column names enclosed in double quotes can contain any characters except for newlines and carriage returns. To use double quotation marks in a name, put two double quotation marks back to back.
- Unless names are enclosed in double quotes, they are treated as case-insensitive.

# Identifiers

Learn about Ocient identifier rules for naming tables, columns, and other SQL elements, ensuring consistency and clarity in database design.

In the Ocient® System, identifiers are lexical tokens that name specific entities in the database. For example, a table name is an identifier.

In most cases, you do not have to quote an identifier. However, the identifier must meet these two conditions:

- Start with a letter followed by zero or more letters, digits, or underscores.
- Must not be a reserved word. For the full list of reserved words, see **Reserved Words**.

If the identifier does not meet either of these conditions, then enclose the identifier in double quotes `""` to create a delimited identifier. SQL is case-insensitive, and the database normalizes identifiers to lowercase. For example, you must add double quotes to the `1start_with_digit`, `hy-phen`, and `mixedCase` identifiers so that the database can parse them correctly: `"1start_with_digit"`, `"hy-phen"`, and `"mixedCase"`.

The system uses identifiers to identify these objects:

- Database name
- Schema name
- Function name
- Table name
- Table alias name
- Column name
- Column alias name
- Index name
- View name
- Task name

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

- Node names
- Machine learning model name
- Connectivity pool name
- Connectivity pool participant name
- Storage space name
- Cluster name
- Service class name
- Single sign-on (SSO) protocol
- Tag name
- JSON key
- Username
- Group name
- Common table expression
- Subexpression name
- Data pipeline name
- Data pipeline type

# Generate Tables Using sys.dummy

Use the sys.dummy table in Ocient to generate sample rows for testing queries, prototyping SQL, demonstrating functions, and learning syntax patterns.

`sys.dummy` is a virtual table that the OcientAIQ™ Unified Data Platform generates with a specific number of rows. This table is a handy tool to quickly create tables for testing without scripting extensive DDL statements.

When you execute `sys.dummy`, the database creates a table with a single column, which is automatically populated with incremental integers.

`sys.dummy` follows similar rules to a table reference. The SQL statement must specify a non-negative integer that represents the number of rows for the SQL statement to generate in the table.

In this syntax block, the `{N}` parameter represents the number of rows for `sys.dummy` to generate.

> ⓘ `SELECT *` queries that lack a `FROM` clause automatically reference the `sys.dummy1` table.
>
> For example, `SELECT *;` is the same as `SELECT * FROM sys.dummy1;`.

## Syntax

SQL

```
sys.dummy{N}
```

| Parameter | Description |
|---|---|
| `{N}` | The number of rows for `sys.dummy` to generate.<br>The minimum numeric value for `{N}` is `0`, and the maximum is `9223372036854775807`. This parameter must not have any leading or trailing characters. If `{N}` does not adhere to these limits, the database returns an error.<br>Do not specify curly brackets with this parameter in queries. |

## Example

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

Create a table with 10 rows.

```sql
SELECT * FROM sys.dummy10;
```

*Output: *

```sql
c1
---
1
2
3
4
5
6
7
8
9
10
```

# Transactional Control Language (TCL) Statement Reference

Reference Transactional Control Language (TCL) statements in Ocient to manage multi-statement transactions with autocommit, commit, and rollback.

The Ocient® System supports multi-statement transactions. By default, a connection uses autocommit mode, in which the database commits each statement immediately. To group several statements into a single transaction, disable autocommit with **SET AUTOCOMMIT**, and then end the transaction with **COMMIT** or **ROLLBACK**.

> The HTTP Query API does not support transactions. To use transactions, connect to the Ocient System with the Ocient JDBC driver or the pyocient module.

> The Apache® Spark™ Connector supports transactions and performs the commit and rollback actions automatically. When you use the Spark Connector, you do not need to issue COMMIT or ROLLBACK statements.

## SET AUTOCOMMIT

Enables or disables autocommit mode for the connection. When autocommit is enabled, the database commits each statement immediately. This mode is the default. When autocommit is disabled, the database groups subsequent statements into a transaction that you complete with the **COMMIT** or **ROLLBACK** statements. Valid values are:

- `ON` — Enables autocommit mode, in which the database commits each statement immediately. This value is the default.
- `OFF` — Disables autocommit mode. The database groups subsequent statements into a transaction until you enter the COMMIT or ROLLBACK statement.

When you change autocommit from `OFF` to `ON`, the database commits any pending transactions.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

After you disable autocommit, ensure that you execute SQL statements that are supported by transactions. Otherwise, the database throws an error. For a list of supported statements, see **Transactions**.

### Syntax

```
SQL

SET AUTOCOMMIT { ON | OFF }
```

### Example

This example disables autocommit, inserts two rows into a table, and then commits the transaction to permanently save the rows.

Disable autocommit.

```
SQL

SET AUTOCOMMIT OFF;
```

Create the public.txn_demo table with two columns: a number and a string.

```
SQL

CREATE TABLE public.txn_demo (
    id INT,
    term VARCHAR(255));
```

Insert two rows into the `public.txn_demo` table and commit these two transactions.

```
SQL

INSERT INTO public.txn_demo VALUES (1, 'alpha');
INSERT INTO public.txn_demo VALUES (2, 'beta');
COMMIT;
```

Drop the table.

```sql
DROP TABLE public.txn_demo;
```

# COMMIT

Commits the current transaction and permanently saves all changes made after the transaction started. This statement applies only when you disable autocommit with **SET AUTOCOMMIT**. When autocommit is enabled, COMMIT has no effect.

### Syntax

```sql
COMMIT
```

### Example

This example disables autocommit, inserts two rows into the `public.txn_demo` table, and then commits the transaction to permanently save the rows.

Disable the autocommit.

```sql
SET AUTOCOMMIT OFF;
```

Create the public.txn_demo table with two columns: a number and a string.

```sql
CREATE TABLE public.txn_demo (
    id INT,
    term VARCHAR(255));
```

Insert two rows into the `public.txn_demo` table and commit these two transactions.

```sql
INSERT INTO public.txn_demo VALUES (1, 'alpha');
INSERT INTO public.txn_demo VALUES (2, 'beta');
COMMIT;
```

Drop the table.

```sql
DROP TABLE public.txn_demo;
```

# ROLLBACK

Rolls back the current transaction and discards all changes made after the transaction started. This statement applies only when you disable autocommit with **SET AUTOCOMMIT**. When autocommit is enabled, ROLLBACK has no effect.

### Syntax

```sql
ROLLBACK
```

### Example

This example disables autocommit, inserts two rows in a table, and then rolls back the transaction to discard the inserted rows.

Disable the autocommit.

```sql
SET AUTOCOMMIT OFF;
```

Create the `public.txn_demo` table with two columns: a number and a string.

```sql
CREATE TABLE public.txn_demo (
    id INT,
    term VARCHAR(255));
```

Insert two rows into the `public.txn_demo` table, then roll back both transactions.

```sql
INSERT INTO public.txn_demo VALUES (3, 'gamma');
INSERT INTO public.txn_demo VALUES (4, 'delta');
ROLLBACK;
```

Drop the table.

```sql
DROP TABLE public.txn_demo;
```

# Errors and Warnings

Reference for handling errors and warnings in Ocient SQL queries, data pipelines, and system operations, including common codes and resolution guidance.

The Ocient® System produces these error and warning codes as part of its operation. Refer to these codes for their description.

You can also execute this SQL statement using the `sys.sql_messages` system catalog table to view the codes and descriptions in the database: `SELECT * FROM sys.sql_messages`.

## Error Codes

The error codes are negative values that split into ranges by number such as -100s, -200s, and so on.

| -1xx Codes | Description |
|---|---|
| -100 | Unknown error occurred. |
| -101 | This is an internal error that indicates that a client (driver or connector) received an invalid response from the server. |
| -102 | Internal error that indicates a corruption of the serialized result set sent from the server to the client. |
| -103 | Internal error that indicates an unexpected condition has happened. |
| **-2xx Codes** | **Description** |
| -200 | A client attempted a connection with a malformed connection string. |
| -201 | The connection to the server failed. |
| -202 | The handshake with the server failed. |
| -203 | The connection to the server was unexpectedly closed. |
| -204 | A network communications error has occurred. |
| -205 | The client tried to connect to a database with a specified name, but no database with that name exists. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| -1xx Codes | Description |
|---|---|
| -206 | The target node is offline. |
| **-3xx Codes** | **Description** |
| -300 | An argument to a driver method execution was invalid. |
| -301 | A driver method executed, but the input argument object was already closed. |
| -302 | The cursor was not positioned in a valid row. |
| -303 | An attempt was made to create a new result set, but the previous result set for the connection was still open. |
| -304 | The user and password combination was incorrect. |
| -305 | A statement that was not a query was passed to executeQuery(). |
| -306 | A statement that was a query was passed to executeUpdate(). |
| -308 | A driver execution was made that is not implemented. |
| -316 | No database connection exists. |
| -317 | Invalid data was detected for a parameter marker. |
| -318 | The cursor was not in the required state. |
| -320 | There is currently no result set. |
| -321 | A NULL indicator pointer was required but not specified. |
| -322 | A connection attribute that is not supported was specified in SQLBrowseConnect. The four supported attributes are: “DRIVER”, “DSN”, “UID”, “PWD”. |
| -328 | Divide by zero. |
| -329 | Invalid floating point operation that resulted in NaN or Inf. |
| -330 | The action conflicts with the current state of the database. |
| -331 | The unconditional DELETE FROM statement is rewritten using the TRUNCATE statement. In this case, the database does not create a plan that would appear in the results from the execution of the EXPLAIN statement. |
| -332 | Already in use. Used mostly in DDL when a resource or option is already assigned to the object. |
| -333 | Optional value was substituted. |
| -336 | Cannot execute the new SQL statement as the system is processing a prior statement using the same connection in the background. |
| **-4xx Codes** | **Description** |

| -1xx Codes | Description |
|---|---|
| -400 | One of the referenced columns does not exist. |
| -401 | The requested data type conversion was invalid. |
| -402 | Unknown data type. |
| -403 | A column name was ambiguous in the context where it was used. |
| -404 | Two incompatible data types were specified as return types in a case statement. |
| -405 | Join leads to a duplicate column name. |
| -406 | Invalid POINT conversion from NULL. |
| -407 | Column value is larger than internal limits. |
| **-5xx Codes** | **Description** |
| -500 | Generic syntax error. |
| -501 | The SQL statement is not valid or not supported in the context where it was used. |
| -502 | A duplicate common table expression name was detected. |
| -503 | The number of columns does not match the SELECT statement. |
| -504 | A negative limit was specified. |
| -505 | A negative offset was specified. |
| -506 | An incorrect number of arguments was specified in a function. |
| -507 | Aggregation of a constant value is invalid. |
| -508 | An argument to a function had an incorrect data type. |
| -509 | An invalid comparison was detected. |
| -510 | Aggregation was used in a context where it is not allowed (possibly something in a WHERE clause that belongs in a HAVING clause). |
| -511 | A HAVING clause did not have any aggregation in it. |
| -512 | An ORDER BY clause referenced a column by position and that position was out of range. |
| -513 | An expression of type list cannot be returned in a result set. |
| -514 | You cannot have an expression of type list within another list. |
| -515 | A list expression contains incompatible types. |
| -516 | The function does not exist. |

© 2026 Ocient, Inc

| -1xx Codes | Description |
|---|---|
| -517 | If the result of an expression is a time interval type, the result must be cast to an integral type. |
| -518 | An invalid matrix literal was specified. |
| -519 | A matrix literal had incorrect dimensions. |
| -520 | An invalid query priority was specified. |
| -521 | A column reference in a SELECT statement is invalid due to aggregation. |
| -522 | Columns for the first and second SELECT statements for the UNION, EXCEPT, or INTERSECT statement are not compatible. |
| -523 | An expression in the CASE condition is not allowed. |
| -524 | An expression in the JOIN condition is not allowed. |
| -525 | Aggregation is not allowed in the PARTITION BY or ORDER BY clauses of a windowed aggregate. |
| -526 | A non-constant value was found where a constant was expected in an argument of a windowed aggregate. |
| -527 | Range-based framing does not allow the PRECEDING or FOLLOWING keywords. |
| -528 | ORDER BY with a column ordinal is not allowed in a windowed aggregate. |
| -529 | A frame specification is not allowed if no ORDER BY clause is specified in a windowed aggregate. |
| -530 | UNBOUNDED PRECEDING is only allowed on the starting frame bound. |
| -531 | UNBOUNDED FOLLOWING is only allowed on the ending frame bound. |
| -532 | The ending frame bound cannot be less than the starting frame bound. |
| -533 | No frame specification is allowed for this particular windowed aggregate. |
| -534 | A window function requires a positive integer argument. |
| -535 | The specified window function requires an ORDER BY statement in the OVER() clause. |
| -536 | Invalid aggregation. |
| -537 | Invalid expression. |
| -538 | A CASE expression within a CASE expression is not allowed. |
| -539 | Window function was used in a context where it is not allowed (perhaps in a predicate of a WHERE or HAVING clause). |

| -800 | An MLMODEL with that name was not found. |
| -801 | An MLMODEL with that name already exists. |
| -802 | The user does not have the authority to create an MLMODEL. |
| -803 | The user does not have the authority to drop the MLMODEL. |
| -804 | Unable to create an MLMODEL due to a singular matrix. |
| -805 | Unable to create an MLMODEL because the training set is empty. |
| -806 | Unable to perform LUP decomposition on this singular matrix. |
| -807 | The user does not have the authority to modify the MLMODEL. |
| **-9xx Codes** | **Description** |
| -900 | Operation was canceled or aborted. |
| -901 | I/O error. |
| -902 | Scalar Subquery Cardinality Violation. |
| -903 | Numeric value out of range. |
| -904 | Plan compilation error. |
| -905 | TKT limit reached. |
| -906 | Out of memory. |
| -907 | Segment not available. |
| -908 | System is still initializing. |
| -909 | Out of temporary disk space. |
| -910 | Operation was automatically killed due to drop in the client connection. |
| -911 | Failed to acquire OSN (Ownership Sequence Number). Data for querying is no longer available to the storage cluster. |
| -912 | Query probe registration expired. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| -1xx Codes | Description |
|---|---|
| -913 | Maximum unique values for the GDC column reached. |
| -914 | The I/O buffer pool is not large enough to satisfy the query. |
| -915 | NULL is not allowed. |
| -916 | The operation is not allowed on the current version of the system. |
| -917 | Deletes are disabled on virtual segments. Retry after all nodes are up. |
| -918 | One or more API requests to the storage cluster failed. |
| -919 | A numeric overflow occurred. |
| -920 | The statement is not allowed in a transaction. |
| -921 | Transaction not found. |
| -922 | The statement size is larger than the allowed limit. |
| -923 | The maximum number of iterations was exceeded. |
| -925 | The pipeline execution failed. |
| -929 | The storage cluster is out of space. Free the space or reduce the amount of data written. |
| **-10xx Codes** | **Description** |
| -1000 | The privilege target already has the privilege. |
| -1001 | The user does not have the authority to grant this privilege. |
| -1002 | The privilege target does not have that privilege. |
| -1003 | The referenced role does not exist. |
| -1004 | The provided object ID was not found. |
| -1005 | Create task failure. |
| -1006 | Task already in progress. |
| -1007 | Could not find the supplied service class. |
| -1008 | Supplied service class definition is invalid. |
| -1009 | The grant role target already has that role. |
| -1010 | The revoke role target does not have that role. |
| **-11xx Codes** | **Description** |
| -1100 | No available service classes for the user have available query slots. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| -1xx Codes | Description |
|---|---|
| -1101 | The specified node is not found. |
| -1102 | Segment not found. |
| -1110 | No service classes exist for the user, including the default, whose statement text matches this query. |
| -1111 | Cluster not found. |
| -1112 | A cluster with that name exists. |
| -1120 | Query exceeded service class time limit. |
| -1121 | Query exceeded session time limit. |
| -1122 | Query exceeded query time limit. |
| -1123 | Query exceeded service class row limit. |
| -1124 | Query exceeded session row limit. |
| -1125 | Query exceeded query row limit. |
| -1126 | Query exceeded service class temporary disk limit. |
| -1127 | Query exceeded session temporary disk limit. |
| -1128 | Query exceeded query temporary disk limit. |
| -1129 | Too many columns in result set for the service class. |
| -1130 | Too many columns in result set for the session. |
| -1131 | Too many columns in result set for the query. |
| -1132 | Query exceeded service class memory limit. |
| -1133 | Query exceeded session memory limit. |
| -1134 | Query exceeded query memory limit. |
| -1135 | Query exceeded service class CPU limit. |
| -1136 | Query exceeded session CPU limit. |
| -1137 | Query exceeded query CPU limit. |
| **-12xx Codes** | **Description** |
| -1200 | The security integration is disabled. |
| -1201 | The security integration does not exist. |
| -1202 | The request failed due to a network communications error. |

| -1xx Codes | Description |
|---|---|
| -1203 | The Single Sign On request identifier could not be found. |
| -1204 | No session associated with the connection exists. |
| -1205 | The supplied security token is invalid. |
| -1206 | The supplied security token signature does not match the expected value. |
| -1207 | The supplied security token has a signature fingerprint from an unknown entity. |
| -1208 | The supplied security token has expired. |
| -1220 | A network communications error occurred. |
| -1221 | The OpenID provider rejected the request that indicates an internal server error. |
| -1222 | The OpenID provider returned an invalid response that indicates an error with the provider. |
| -1223 | The request_uri in the Authorization Request returns an error or contains invalid data. |
| -1224 | The OpenID provider does not support use of the request parameter. |
| -1225 | The OpenID provider does not support use of the request_uri parameter. |
| -1226 | The OpenID provider discovery document is invalid. |
| -1227 | The database OpenID configuration is invalid. |
| -1228 | The OpenID ID or access token has expired. |
| -1229 | The ID or access token was signed by a key not known to the OpenID provider. |
| -1230 | The signing key returned by the OpenID provider is invalid. |
| -1231 | The token contains an invalid claim. |
| -1232 | The token was issued by an unknown OpenID provider. |
| -1233 | The token was issued for an alternate audience. |
| -1234 | The token signature is invalid, which implies the token was manipulated enroute to the database. |
| -1235 | The specified ID token is invalid. |
| -1236 | The specified Access token is invalid. |
| -1237 | The refresh token returned from the provider is invalid. |
| -1238 | The authentication server has timed out while waiting for client authentication. |
| -1250 | The client is not authorized to request an authorization code using this method. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| -1xx Codes | Description |
|---|---|
| -1251 | The resource owner or authorization server denied the request. |
| -1252 | The authorization server does not support obtaining an authorization code using this method. |
| -1253 | The requested scope is invalid, unknown, or malformed. |
| -1254 | The request is missing a required parameter, includes an invalid parameter value, includes a parameter more than once, or is otherwise malformed. |
| -1255 | The authorization server encountered an unexpected condition that prevented it from fulfilling the request. |
| -1256 | The authorization server is currently unable to handle the request due to a temporary overloading or maintenance of the server. |
| -1257 | Cannot lock table. |
| -1258 | Cannot unlock table. |
| -1259 | Cannot delete from a join or a view with multiple tables. |
| -1260 | Invalid delete target. |
| **-13xx Codes** | **Description** |
| -1300 | Error parsing JSON. |
| -1301 | The JSON object has the wrong type. |
| -1302 | The JSON object has no such field. |
| **Other** | **Description** |
| -9999 | Undefined exception. |

# Warning Codes

The warning codes are positive values.

| Warning Code | Description |
|---|---|
| +1 | Query exceeded the time limit but continues to run, and the database caches the results. |
| +100 | The password has expired. Change the password. |
| +300 | Data received by a JDBC driver was truncated. |

| Warning Code | Description |
|---|---|
| +900 | A query returned an empty result set. |
| +901 | The query is estimated to have a long execution time. |
| +1113 | The referenced object does not exist. |
| +1114 | An object with that name exists. |
| +1115 | Not authorized to take this action. |
| +1116 | Restart the node for changes to take effect. |
| +1117 | Complete system restart required for changes to take effect. |
| +1118 | Statement contains invalid syntax. |
| +1119 | Unable to drop some objects in the request. |
| +1120 | Restart all SQL nodes for changes to take effect. |
| +1121 | A cast failed. The database replaced the corresponding value with NULL. |
| +1122 | The update is in progress and has not completed yet. |
| +1123 | This pipeline definition leads to a suboptimal pipeline. |
| +1124 | Generated password for user. |
| +1303 | GDC optimizations on imported maps might lead to incorrect results during execution. |

# Data Pipeline Loading Errors

Reference of Ocient data pipeline error codes and messages, with parameter descriptions and recommended actions for resolving load and parsing failures.

This table captures error codes and their corresponding error messages that you can encounter when you load data using data pipelines in the Ocient® System. Also, the table contains the definitions of the parameters in the error messages, descriptions that explain the error messages, and actions you can take to resolve the errors.

| Code | Error Message | Message Parameters | Description |
|---|---|---|---|
| OLD00 | Key `key` for class `class` must be set to a non-NULL value. Details: `details` | `key` : The key of the missing property.<br>`class` : The class that has the missing property.<br>`details` : Additional information about the error. | This error occurs when the loading process reads the pipeline definition missing a required property. |
| OLD01 | Value `value` is not acceptable with the key `key` for class `class` . Expected `example` . Details: `details` | `value` : The value that you set for the specified pipeline definition key.<br>`key` : The pipeline definition key with an incorrect value.<br>`class` : The class that contains the property.<br>`example` : An example or description of the correct value.<br>`details` : Additional information about the error. | This error occurs when the loading process reads the pipeline definition that contains a key with an incorrect value. |
| OLD02 | No class with name `class` exists in the pipeline builder packages. Pipeline cannot run. | `class` : The class that cannot be found. | This error occurs when the loading process reads the pipeline |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Code | Error Message | Message Parameters | Description |
| --- | --- | --- | --- |
| | | | definition that contains an unknown class. |
| OLE00 | Failed to extract record with index `index` from `sourceName`. Details: `details` | `index`: The index of the record (index starts at 1) in the source where the error occurred. `sourceName`: The name of the source resource where the error occurred. `details`: Additional information about the error. | This error occurs when the extraction of a record fails. |
| OLE01 | `dataExtract` cannot be extracted from `sourceData`. Details: `details` | `dataExtract`: The data to extract. `sourceData`: The source data for the extraction. `details`: Additional information about the error | This error occurs when the extraction of data from a record fails. |
| OLE02 | The source data has encountered invalid data or character sets. If invalid data is expected in the load, turn off the VALIDATE_CHARACTERS option or use the REPLACE_INVALID_CHARACTERS option instead. | None | This error occurs when the pipeline has the VALIDATE_CHARACTERS option turned on and the load encounters invalid data. |

| Code | Error Message | Message Parameters | Description |
| --- | --- | --- | --- |
| OLM00 | The `message` is too large. `modification` | `message` : The type of message that is too large.<br><br>`modification` : An example or description of a modification to limit the payload size of the message. | This error occurs when an internal communication fails because the message size exceeds the maximum size set by the system. |
| OLO00 | Failed to connect to `sourceType` source because the specified `locationType` `location` was not found. Details: `details` | `sourceType` : The type of the source.<br>`locationType` : The type of the data location argument that was not found.<br>`location` : The value of the data location argument that was not found.<br>`details` : Additional information about the error. | This error occurs when the pipeline cannot find the source data (e.g., cannot find the configured bucket or file path). |
| OLO01 | Failed to connect to `sourceType` source because the access credentials are unauthorized. Details: `details` | `sourceType` : The type of source where access is denied.<br>`details` : Additional information about the error. | This error occurs when the pipeline cannot connect to the source due to invalid credentials. |
| OLO10 | File list is empty at the `sourceType` source provided. The locations searched are: `location` . Details: `details` | `sourceType` : The type of the source.<br>`location` : The value of the data location argument that was not found. | This error occurs when the pipeline cannot find the source data (e.g., the file path is empty). |

| Code | Error Message | Message Parameters | Description |
| --- | --- | --- | --- |
| OLO50 | File `fileName` was not found. | `fileName` : The name of the missing file. | This error occurs when the pipeline is configured to fail on missing files, and it cannot find a file in the list. |
| OLS00 | Failed to load transformed value `value` to sink after `transformName` . Details: `details` | `value` : The value that the Loader Node could not load to the sink. `transformName` : The name of the executed transform. `details` : Additional information about the error. | This error occurs when the Loader Node cannot load a transformed value to the sink. For example, the transformed value might be too large for the sink column. |
| OLS97 | No table with name `tableName` exists in sink at `ipAddress` : `port` . The available tables are: `existingTables` . | `tableName` : The fully specified name of the specified table. `ipAddress` : The IP address for the Loader Node of the Ocient sink. `port` : The external TCP port for the Loader Node of the Ocient sink. `existingTables` : The list of existing tables in the same database and schema as the specified table. | This error occurs when no table with the specified name exists in the sink, but the database and schema of the table do exist. |
| OLS98 | The column name `columnName` does not exist. The columns available to the pipeline from the `tableName` table are: `existingColumns` . | `columnName` : The name of the column that was not found. `tableName` : The table that was searched. `existingColumns` : The columns in the table that are | This error occurs when the target table in the sink does not contain all the columns specified in the pipeline or a column specified as a transform target is not declared in the sink definition of the pipeline. |

| Code | Error Message | Message Parameters | Description |
| --- | --- | --- | --- |
| | | available to the pipeline. | (The database ignores deleted columns. This error does not occur when you load data to a deleted column.) |
| OLS99 | Failed to connect to sink at `ipAddress` : `port` . Check that a streamloader at that address is reachable. | `ipAddress` : The IP address for the Loader Node of the Ocient sink. `port` : The external TCP port for the Loader Node of the Ocient sink. | This error occurs when the pipeline cannot connect to its Ocient sink using a Loader Node. |
| OLT00 | Cannot perform operation `operationName` because the inputs are `inputType` . Expected inputs are `expectedType` . | `operationName` : The name of the operation that cannot be performed because its inputs are the wrong type. (usually the name of a transform) `inputType` : The type of inputs that the operation received. `expectedType` : The type of inputs that the operation expects to receive. | This error occurs when transforms in a column are not composed correctly. |
| OLT01 | Failed to transform value `value` using `transformName` . Details: `details` | `value` : The value that was not transformed. `transformName` : The name of the failed transform. `details` : Additional information about the error. | This error occurs when a transformation fails. |
| OLT02 | Value `value` is not an acceptable `parameterName` for `transformName` . Expected `example` . | `value` : The incorrect value for the specified parameter. `parameterName` : | This error occurs when the parameter of the transform is not configured correctly. |

| Code | Error Message | Message Parameters | Description |
| --- | --- | --- | --- |
| | | The name of the specified parameter. `transformName` : The name of the transform that is not configured correctly. `example` : An example or description of the correct value. | |
| OLT03 | Failed to transform value `value` using `transformName` because the value is `valueDescription`. Expected `example`. | `value` : The value that was not transformed. `transformName` : The name of the failed transform. `valueDescription` : A feature or description of the incorrect value for this transform. `example` : An example or description of the correct value. | This error occurs when a transformation fails because the data is not correct for the transform. |
| OLT04 | Failed to match value `value` to format `format` in `transformName` because `valuePart` at position `valuePartPosition` does not match pattern `pattern`. Expected `example`. | `value` : The value that was not parsed with the transform format. `format` : The transform format. `transformName` : The name of the failed transform. `valuePart` : The part of the value that was unmatched. `valuePartPositio n` : The position (index starts at 1) of the part unmatched in the value. `pattern` : The pattern in the | This error occurs when a transformation fails because the value does not match the specified transform format. |

| Code | Error Message | Message Parameters | Description |
| --- | --- | --- | --- |
| | | transform format that did not match part of the value. `example` : An example or description of the correct value. | |
| OLTM0 | Failed to transform `value` value using `transformName` . `details` . | `value` : The value that was not transformed. `transformName` : The name of the failed transform. `details` : Additional information about the error. | This error occurs when an EXPLODE transformation fails. |
| OL998 | An error occurred in library `library` : `details` | `library` : The name of the library where the error occurred. `details` : Additional information about the error. | This error occurs when the Ocient System detects an error from an internal library. |
| OL999 | An error occurred in class `class` : `details` | `class` : The class that threw the exception. `details` : Additional information about the error. | This error occurs when the Ocient System detects a general error. |

# Reserved Words

Reserved words are keywords in Ocient® that are specific words that the database can interpret as SQL syntax or unquoted identifiers.

Keywords in Ocient® are specific words that the database can interpret either as SQL syntax or unquoted identifiers. You cannot use a subset of them, named reserved words, as unquoted identifiers without introducing parsing ambiguities in the database. As a result, when you use these words as an identifier, you must surround the reserved word with double quotes.

You can find these words in the sys.reserved_words system catalog table.

# System Catalog Reference

Reference for Ocient system catalog tables and views, including schemas, columns, and example queries for inspecting metadata, sessions, and storage objects.

The Ocient® System Catalog comprises a set of virtual tables and views. Together, these present administrators with metadata that describes the state of the data stored in the system, activity on the system, and the configuration of the system. The `information_schema` schema contains views that present information joined from multiple system catalog tables.

- **System Catalog** — Listing and description of all system catalog tables included in the system.
- **Information Schema** — Listing and description of all `information_schema` schema views and `SHOW` commands defined by default.

To explore the system catalog tables, use sample queries for various topics as described in **Discover Insights From System Catalog Tables**.

# System Catalog

Overview of the Ocient system catalog for metadata and schema management, including tables for sessions, queries, segments, storage, users, and configuration.

The system catalog exposes read-only virtual tables that contain metadata about the system.

# Catalog Table Details

## Configuration

### sys.config

This table contains all configuration overrides applied on the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| scope_type | CHAR | Type of the scope. |
| scope_id | UUID | Universally Unique IDentifier (UUID) of the storage scope where this override applies. |
| key | CHAR | String that represents the configuration parameter. |
| value | CHAR | Value for the configuration parameter key. |

### sys.node_config

This table contains the effective node configuration for all nodes in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| node_id | UUID | Universally Unique IDentifier (UUID) of the node where this configuration exists (sys.nodes). |
| key | CHAR | String that represents the configuration parameter. |
| value | CHAR | Value for the configuration parameter key. |
| restart_required | BOOLEAN | Whether the parameter requires a node restart to take effect. |

## Connectivity Pools

### sys.connectivity_pool_participants

This table contains the connectivity pool participants and their information.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | Universally Unique IDentifier (UUID) of the connectivity pool that contains the participant. |
| node_id | UUID | UUID of the participant node. |
| created_at | TIMESTAMP | Timestamp that indicates the creation of the connectivity pool participant. |
| updated_at | TIMESTAMP | Timestamp that indicates the last update of the connectivity pool participant. |
| listen_address | CHAR | Address where the participant node listens. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| listen_port | INT | Port number where the participant node listens. |
| advertised_address | CHAR | Address that the participant node advertises to the client. |
| advertised_port | INT | Optional port number that the participant node advertises to the client. |
| openapi_port | INT | Optional port number where the API, written according to the OpenAPI Specification (OAS), listens. |
| openapi_advertised_address | CHAR | Optional address that the OpenAPI participant advertises for callbacks. |
| openapi_advertised_port | INT | Optional port number that the OpenAPI participant advertises for callbacks. |
| ssl_certificate_file | CHAR | Optional base name of the SSL certificate file for the participant. |
| openapi_ssl_certificate_file | CHAR | Optional base name of the SSL certificate file for the OpenAPI endpoint. |

## sys.connectivity_pools

This table contains the connectivity pools and their information (excluding participants).

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| id | UUID | Universally Unique IDentifier (UUID) of the connectivity pool. |
| name | CHAR | Name of the connectivity pool. |
| created_at | TIMESTAMP | Timestamp that indicates the creation of the connectivity pool. |
| updated_at | TIMESTAMP | Timestamp that indicates the last update of the connectivity pool. |
| source_address | CHAR | Source address in CIDR notation for the connectivity pool. |
| source_port | INT | Optional source port of the connectivity pool. |
| priority | INT | Priority of the connectivity pool. |
| sso_integration_name | CHAR | Name of the default SSO security integration for the connectivity pool. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| require_sso | BOOLEAN | Whether this connectivity pool requires SSO authentication. |

# Databases

## sys.columns

This table contains all columns in each table in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | Universally Unique IDentifier (UUID) of the column. |
| name | CHAR | Name of the column. |
| data_type | CHAR | Data type of the column (INT, CHAR, BOOLEAN, etc.). |
| position | INT | Position of the column in its table. |
| table_id | UUID | UUID of the table that contains this column (sys.tables). |
| nullable | BOOLEAN | Specifies whether the values in this column can be NULL. |
| default_expression | CHAR | Default value of this column when the value is unspecified. |
| description | CHAR | Description of the column. |
| type_hint | CHAR | Type hint for the expected type of the column. |
| ordinal | LONG | Ordinal of the column with respect to its table. |
| gdc_type | CHAR | Type of GDC applied to this column. |
| system | BOOLEAN | Specifies whether the column is a system column. |

## sys.constraints

This table contains the constraints for the database.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | The Universally Unique IDentifier (UUID) of the constraint. |
| table_id | UUID | The UUID of the table (sys.tables). |

| Column Name | Column Type | Column Description |
|---|---|---|
| name | CHAR | The name of the constraint that has to be unique within an individual table. |
| constraint_type | CHAR | The type of the constraint (PRIMARY_KEY, UNIQUE, FOREIGN_KEY). |
| column_names | ARRAY(CHAR) | The names of the columns where the constraint applies. |
| referenced_constraint_id | UUID | The UUID of the referenced constraint. This value is NULL for non-foreign key constraints. |
| referenced_table_id | UUID | The UUID of the referenced table. This value is NULL for non-foreign key constraints. |
| referenced_column_names | ARRAY(CHAR) | The names of the columns where the referenced constraint applies. This value is NULL for non-foreign key constraints. |

## sys.databases

This table contains all databases defined in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | Universally Unique IDentifier (UUID) of the database. |
| name | CHAR | Name of the database. |
| created_at | TIMESTAMP | Timestamp that specifies when the database was created. |
| user_can_view_all_queries | BOOLEAN | Current user can view all queries made in this database |

## sys.function_parameters

This table contains information for the parameters of user-defined functions in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| function_id | UUID | Universally Unique IDentifier (UUID) of the user-defined function (sys.functions). |

| Column Name | Column Type | Column Description |
|---|---|---|
| parameter_name | CHAR | Name of the parameter. This value is NULL if it represents the return value for the function. |
| ordinal_position | INT | Position of the parameter. This value is 0 if it represents the return value for the function. Otherwise, this value increments from 1 for input parameters. |
| data_type | CHAR | Data type of the parameter. The default value is NULL. |
| nullable | BOOLEAN | Whether you can specify this parameter as NULL. If you set this parameter to `true`, then it is nullable. |

## sys.functions

This table contains all of the user-defined functions in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | Universally Unique IDentifier (UUID) of the user-defined function. |
| schema | CHAR | Schema of the user-defined function. |
| name | CHAR | Name of the user-defined function. |
| sql_expression | CHAR | For SQL user-defined functions, the expression that defines the function. |
| database_id | UUID | UUID of the database of this user-defined function (sys.databases). |
| created_at | TIMESTAMP | Timestamp of when this user-defined function was created. |
| updated_at | TIMESTAMP | Timestamp of when this user-defined function was last updated. |
| language | CHAR | Language that the user-defined function is written in. |
| function_type | CHAR | Type of the user-defined function |
| filename | CHAR | For non-SQL user-defined functions, the name of the file containing the user-defined function code. |
| function_name_in_external_code | CHAR | For non-SQL user-defined functions, the name of the Java® or Python® function or method that defines the user-defined function. |

| Column Name | Column Type | Column Description |
|---|---|---|
| return_type | CHAR | Return type of the user-defined function. |
| canonical_name | CHAR | Canonical name of the user-defined function (name_argcount). |
| deterministic | BOOLEAN | Whether the user-defined function is deterministic (does not execute non-deterministic functions). |
| description | CHAR | Description of the user-defined function. |

## sys.global_map_table_info

This table contains the global dictionary compression (GDC) details associated with each compressed column.

| Column Name | Column Type | Column Description |
|---|---|---|
| table_id | UUID | Universally Unique IDentifier (UUID) of the table (sys.tables). |
| column_id | UUID | UUID of the column (sys.columns). |
| compressed_size | INT | Compressed column size (in bytes). |
| max_count | LONG | Maximum amount of unique column values allowed in the column. |
| current_count | LONG | Current amount of unique column values in the column. |

## sys.index_advisor_enabled

This table contains all tables and databases where the index advisor is currently enabled.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | Universally Unique IDentifier (UUID) of the table or database. |
| name | CHAR | Name of the table or database. |
| object_type | CHAR | Determines whether this object is a database or table. |

## sys.index_columns

This table contains the index settings applied to each column.

| Column Name | Column Type | Column Description |
|---|---|---|
| index_id | UUID | Universally Unique IDentifier (UUID) that represents the index (sys.indexes). |
| column_id | UUID | UUID that represents the column (sys.columns). |
| ordinal | INT | Ordinal of the column in the index structure. |
| tuple_element | CHAR | Specifies the name of the component column that the index applies to if the index exists on a tuple column. |
| ascending | BOOLEAN | Indicates whether the values in this column are built in ascending order. |
| column_ordinal | LONG | Ordinal position of this column in the source table. |

## sys.index_recommendations

This view contains aggregated index recommendations with one recommendation per column that chooses the most frequently suggested index type.

| Column Name | Column Type | Column Description |
|---|---|---|
| table_name | VARCHAR | The name of the table. |
| column_name | VARCHAR | The name of the column. |
| create_index_sql | VARCHAR | The SQL statement to use for index creation. |
| index_usage_count | BIGINT | The number of times the database uses this index. |

## sys.index_usage

This view contains index usage information from the persistent index usages table.

| Column Name | Column Type | Column Description |
|---|---|---|
| table_id | UUID | The Universally Unique IDentifier (UUID) of the table where the index is located. |
| index_id | UUID | The UUID of the index. |
| segment_id | UUID | The UUID of the segment with the index. |

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| query_id | UUID | The UUID of the query that could have used the index. |
| index_used | BOOLEAN | Whether or not the database uses the index. |

## sys.indexes

This table contains all indexes defined on tables.

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| id | UUID | Universally Unique IDentifier (UUID) of the index. |
| name | CHAR | Name of the index. |
| index_type | CHAR | Type of the index. |
| table_id | UUID | UUID of the table for the index (sys.tables). |
| index_use | CHAR | Intended use for the index by the system. |
| ngram_size | INT | Size of each N-gram (in bytes). |
| enabled | BOOLEAN | Whether the index is enabled on this table. |

## sys.locations

This table contains all of the external table providers.

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| id | UUID | Universally Unique IDentifier (UUID) of the location. |
| name | CHAR | Name of the location. |
| remote_info | CHAR | Remote information that defines how to talk to the external table provider. |
| database_id | UUID | UUID of the database of this location (sys.databases). |
| created_at | TIMESTAMP | Timestamp that represents when this location was created. |
| updated_at | TIMESTAMP | Timestamp that represents when this location was last updated. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

## sys.procedure_parameters

This table contains the parameters for SQL stored procedures in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| procedure_id | UUID | Universally Unique IDentifier (UUID) of the stored procedure (sys.procedures). |
| parameter_name | CHAR | Name of the parameter. |
| ordinal_position | INT | The position of the parameter in the argument list of the stored procedure. The position starts at 1. |
| data_type | CHAR | Data type of the parameter. |
| nullable | BOOLEAN | Whether you can specify this parameter as NULL. If you set this parameter to `true`, then it is nullable. |

## sys.procedures

This table contains all of the stored procedures in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | Universally Unique IDentifier (UUID) of the stored procedure. |
| schema | CHAR | Schema of the stored procedure. |
| name | CHAR | Name of the stored procedure. |
| database_id | UUID | UUID of the database of this stored procedure (sys.databases). |
| created_at | TIMESTAMP | Timestamp of when this stored procedure was created. |
| updated_at | TIMESTAMP | Timestamp of when this stored procedure was last updated. |
| language | CHAR | Language that the stored procedure is written in. |
| filename | CHAR | For Java and Python stored procedures, the name of the file that the database should load when it needs this stored procedure. |
| function_name | CHAR | For Java and Python stored procedures, the name of the function that executes the stored procedure. |
| sql_body | CHAR | For SQL stored procedures, the SQL statements to execute when the database runs this stored procedure. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| returns_result | BOOLEAN | For SQL stored procedures, the system sets this value to `true` if the stored procedure returns a result set. The default value is `false`. |
| canonical_name | CHAR | Name of the stored procedure with the suffix that concatenates the `_` character and the number of parameters. |
| description | CHAR | User-defined description of the stored procedure. |
| num_args | INT | Number of arguments the stored procedure accepts. |

## sys.tables

This table contains all tables defined in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | Universally Unique IDentifier (UUID) of the table (sys.tables). |
| name | CHAR | Name of the table. |
| schema | CHAR | Name of the schema. |
| database_id | UUID | UUID of the database (sys.databases). |
| storage_space_id | UUID | UUID of the storage space (sys.storage_spaces). |
| maximum_segment_size_gib | INT | Maximum size of a segment for the table in GiB. |
| description | CHAR | Detailed description of the table. |
| streamloader_property_string | CHAR | Additional properties assigned to control the stream loading behavior for the table. |
| lts_property_string | CHAR | Additional properties assigned to control the Foundation role (formerly “lts role”) behavior for the table. |
| created_at | TIMESTAMP | Timestamp that represents when the table was created. |
| altered_at | TIMESTAMP | Timestamp that represents when the table’s structure was last modified via DDL. |
| rolehostd_version | CHAR | The rolehostd version in which this table was created |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| software_compatible_version | INT | The rolehostd version this table is compatible with. |
| creator_id | UUID | The UUID of the user or group who created the table (sys.users). |

## sys.tkt_table_clustering_column_indices

This table contains the columns defined as part of a clustering index.

| Column Name | Column Type | Column Description |
|---|---|---|
| table_id | UUID | Universally Unique IDentifier (UUID) of the table (sys.tables). |
| column_id | UUID | UUID of the column (sys.columns). |

## sys.tkt_table_info

This table contains the columns that are defined as the time key on each user-defined table and the size of the time bucket in use.

| Column Name | Column Type | Column Description |
|---|---|---|
| table_id | UUID | The Universally Unique IDentifier (UUID) of the table (sys.tables). |
| time_column_id | UUID | The UUID of the column that represents the time column in the table (sys.columns). |
| time_bucket_width | LONG | The width of the time bucket for segmenting data in nanoseconds or days. |
| time_bucket_width_interval | CHAR | The readable interval for the width of the time bucket for segmenting data. |
| retention_policy | LONG | The interval for the retention policy for rolling off data in nanoseconds or days. |
| retention_policy_interval | CHAR | The readable interval of the retention policy for rolling off data. |

## sys.user_mappings

This table contains user mappings for locations.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | Universally Unique IDentifier (UUID) of the user mapping. |
| name | CHAR | Name of the user mapping. |
| local_userid | CHAR | Local user identifier. |
| remote_userid | CHAR | Remote user identifier. |
| location_id | UUID | UUID of the location for this user mapping. |
| database_id | UUID | UUID of the database for this user mapping (sys.databases). |
| created_at | TIMESTAMP | Timestamp that represents when this user mapping was created. |
| updated_at | TIMESTAMP | Timestamp that represents when this user mapping was last updated. |
| remote_password | CHAR | Password for the remote user identifier. |

## sys.view_columns

This table contains all columns in each view in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | The Universally Unique IDentifier (UUID) of the column. |
| name | CHAR | The name of the column. |
| data_type | CHAR | The data type of the column. |
| view_id | UUID | The UUID of the view this column comes from. |
| nullable | BOOLEAN | Whether or not this column is nullable. |
| default_expression | CHAR | The default expression of this column, if it exists. |
| ordinal | LONG | The ordinal of this column. |
| global_dictionary_compression_table_id | UUID | UUID of the table with the GDC column (sys.tables). |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

### sys.views

This table contains all user-defined database views created on the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | Universally Unique IDentifier (UUID) of the view. |
| name | CHAR | Name of the view. |
| database_id | UUID | UUID of the database (sys.databases). |
| schema | CHAR | Schema name where the view exists. |
| query | CHAR | Query used to generate the view content. |
| description | CHAR | Detailed description of the view. |
| global_dictionary_compression_table_id | UUID | UUID of the table with the GDC column (sys.tables). |
| created_at | TIMESTAMP | Timestamp that represents the date and time for the creation of the view. |
| updated_at | TIMESTAMP | Timestamp that represents the date and time for the last update of the view. |
| creator_id | UUID | The UUID of the user or group who created the view (sys.users/sys.groups). |

## Index Advisor

### sys.index_advisor_column_usages

This table contains column usage data collected by the index advisor for recommending secondary indexes.

| Column Name | Column Type | Column Description |
|---|---|---|
| database_id | UUID | The Universally Unique IDentifier (UUID) of the database. |
| database_name | VARCHAR | The name of the database. |
| table_id | UUID | The UUID of the table. |

| Column Name | Column Type | Column Description |
|---|---|---|
| column_id | UUID | The UUID of the column. |
| table_name | VARCHAR | The name of the table. |
| column_name | VARCHAR | The name of the column. |
| index_type_name | VARCHAR | The recommended index type (e.g., `INDEX_TYPE_INVERTED` for an inverted index). |
| query_id | UUID | The UUID of the SQL query that triggered this recommendation. |
| query_time | TIMESTAMP | The timestamp when the query was executed. |
| ngram_value | INT | The recommended ngram size for NGRAM indexes. This value is NULL for other indexes. |
| create_index_sql | VARCHAR | The SQL statement to use for index creation. |

### sys.index_advisor_index_usages

This table contains index usage data collected by the index advisor that tracks whether existing indexes were used.

| Column Name | Column Type | Column Description |
|---|---|---|
| database_id | UUID | The Universally Unique IDentifier (UUID) of the database. |
| database_name | VARCHAR | The name of the database. |
| table_id | UUID | The UUID of the table. |
| index_id | UUID | The UUID of the index. |
| segment_id | UUID | The UUID of the segment. |
| query_id | UUID | The UUID of the SQL query. |
| query_time | TIMESTAMP | The timestamp when the query was executed. |
| index_used | BOOLEAN | Specifies whether the query used the index. |

## Loading

### sys.load_errors

The `load_errors` table shows information for load errors in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| node_id | UUID | The unique identifier of the Loader Node. |
| table_id | UUID | If the event is specific to a table, the unique identifier of the table. |
| error_message | VARCHAR | The message that provides more details about the error. |
| error_timestamp | TIMESTAMP | The timestamp when this error occurred. |
| load_id | UUID | If the event is specific to a pipeline or query, the Universally Unique IDentifier (UUID) of the pipeline or query. |

## sys.load_events

The `load_events` table shows information for the load events in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| node_id | UUID | The unique identifier of the Loader Node. |
| table_id | UUID | If the event is specific to a table, the unique identifier of the table. |
| event_type | VARCHAR | The type of the event. |
| event_timestamp | TIMESTAMP | The timestamp when this event occurred. |
| load_id | UUID | If the event is specific to a pipeline or query, the unique identifier of the pipeline or query. |
| batch_id | UUID | If the event is specific to segment generation, this column is the unique identifier for the batch of pages specified by the system for segment generation. |
| event_message | VARCHAR | The message that provides more details about the event. |

## sys.load_metrics

The `load_metrics` table shows information for the load metrics in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| node_id | UUID | The Universally Unique IDentifier (UUID) of the Loader Node (sys.nodes). |

| Column Name | Column Type | Column Description |
|---|---|---|
| table_id | UUID | If the metric is specific to a table, the UUID of the table (sys.tables). |
| load_id | UUID | If the metric is specific to a data pipeline or query, the UUID of the data pipeline or query. |
| name | VARCHAR | The type of the metric. |
| component | VARCHAR | The component of the metric. |
| value | BIGINT | The value of the metric. |
| updated_at | TIMESTAMP | Timestamp that represents when this metric was updated. |

## sys.segment_batch_events

This table contains information about segment batches during segment generation.

| Column Name | Column Type | Column Description |
|---|---|---|
| batch_id | UUID | The Universally Unique IDentifier (UUID) for the batch. |
| table_id | UUID | The UUID for the table. |
| num_partitions | BIGINT | The number of partitions in this batch. |
| bucket_min | BIGINT | The size, in bytes, of the smallest bucket in this batch. |
| bucket_max | BIGINT | The size, in bytes, of the largest bucket in this batch. |
| scope_id | UUID | The UUID for the scope of this batch. |
| batch_start_time | TIMESTAMP | The start time of the batch analysis. |
| batch_end_time | TIMESTAMP | The end time of the batch analysis, including completion and partitioning. |
| batch_flush_reason | VARCHAR | The reason for the trigger of this batch analysis. |
| size | BIGINT | The total size, in bytes, of this batch. |

## sys.segment_generation_events

This table contains information about individual segments during segment generation.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| batch_id | UUID | The Universally Unique IDentifier (UUID) for the batch. |
| table_id | UUID | The UUID for the table. |
| ida_offset | BIGINT | The index number of the partition in this batch. |
| start_time | TIMESTAMP | The start time of segment analysis. |
| end_time | TIMESTAMP | The end time of segment analysis, including completion and partitioning. |
| size | BIGINT | The total size, in bytes, of this segment. |
| num_rows | BIGINT | The total number of rows in this segment. |

# Machine Learning

## sys.association_rules_models

This table contains the name of the snapshot table for an association rules model.

| Column Name | Column Type | Column Description |
|---|---|---|
| machine_learning_model_id | UUID | Universally Unique IDentifier (UUID) of the machine learning model (sys.machine_learning_models). |
| num_arguments | INT | Number of arguments in the machine learning model data. |
| table_name | CHAR | Name of the snapshot table. |

## sys.bagging_models

This table contains all model parameters for Bagging Models in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| machine_learning_model_id | UUID | Universally Unique IDentifier (UUID) of the machine learning model (sys.machine_learning_models). |
| aggregate_expression | CHAR | The vote expression that retrieves information from the child models. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| num_features | INT | Number of arguments in the machine learning model data. |
| num_children | INT | Number of child models used by the bagging model. |
| accuracy | DOUBLE | Fraction of training data that the bagging model correctly classifies. |
| classes | ARRAY(CHAR) | Distinct output classes. |
| confusion_matrix | ARRAY(ARRAY(LONG)) | Confusion matrix, where the element ith row and jth column denotes the number of actual class i that were predicted to be j. |
| per_class_precision | ARRAY(DOUBLE) | Precisions per class using One-vs-Rest (OVR) calculations. |
| per_class_recall | ARRAY(DOUBLE) | Recalls per class using OVR calculations. |
| per_class_f1 | ARRAY(DOUBLE) | F1 scores per class using OVR calculations. |
| macro_precision | DOUBLE | Average precision over all classes. |
| macro_recall | DOUBLE | Average recall over all classes. |
| macro_f1 | DOUBLE | Average F1 score over all classes. |
| weighted_precision | DOUBLE | Average precision over all classes, weighted by class count. |
| weighted_recall | DOUBLE | Average recall over all classes, weighted by class count. |
| weighted_f1 | DOUBLE | Average F1 score over all classes, weighted by class count. |
| mcc | DOUBLE | Matthews correlation coefficient. |
| per_class_auc_roc | ARRAY(DOUBLE) | Areas under the Receiver Operating Characteristic (ROC) curve for each class, calculated using the One-vs-Rest (OVR) methodology. |
| macro_auc_roc | DOUBLE | Average area under the ROC curve across all classes. |
| weighted_auc_roc | DOUBLE | Average area under the ROC curve across all classes, weighted by class count. |
| r2 | DOUBLE | R^2 value. |
| adjusted_r2 | DOUBLE | Adjusted R^2 value. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| rmse | DOUBLE | Root mean square error. |
| mae | DOUBLE | Mean absolute error. |
| mape | DOUBLE | Mean absolute percentage error. |

## sys.boosting_models

This table contains all model parameters for Boosting Models in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| machine_learning_model_id | UUID | Universally Unique IDentifier (UUID) of the machine learning model (sys.machine_learning_models). |
| expression | CHAR | The SQL expression that defines the boosting model. |
| num_arguments | INT | Number of arguments in the machine learning model data. |
| learning_rate | DOUBLE | Learning rate. |
| loss_function | CHAR | Loss function. |
| initial_predictions | ARRAY(DOUBLE) | Initial predictions. |
| accuracy | DOUBLE | Fraction of training data that the boosting model correctly classifies. |
| classes | ARRAY(CHAR) | Distinct output classes. |
| confusion_matrix | ARRAY(ARRAY(LONG)) | Confusion matrix, where the element ith row and jth column denotes the number of actual class i that were predicted to be j. |
| per_class_precision | ARRAY(DOUBLE) | Precisions per class using One-vs-Rest (OVR) calculations. |
| per_class_recall | ARRAY(DOUBLE) | Recalls per class using OVR calculations. |
| per_class_f1 | ARRAY(DOUBLE) | F1 scores per class using OVR calculations. |
| macro_precision | DOUBLE | Average precision over all classes. |
| macro_recall | DOUBLE | Average recall over all classes. |
| macro_f1 | DOUBLE | Average F1 score over all classes. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| weighted_precision | DOUBLE | Average precision over all classes, weighted by class count. |
| weighted_recall | DOUBLE | Average recall over all classes, weighted by class count. |
| weighted_f1 | DOUBLE | Average F1 score over all classes, weighted by class count. |
| mcc | DOUBLE | Matthews correlation coefficient. |
| per_class_auc_roc | ARRAY(DOUBLE) | Areas under the Receiver Operating Characteristic (ROC) curve for each class, calculated using the One-vs-Rest (OVR) methodology. |
| macro_auc_roc | DOUBLE | Average area under the ROC curve across all classes. |
| weighted_auc_roc | DOUBLE | Average area under the ROC curve across all classes, weighted by class count. |
| r2 | DOUBLE | R^2 value. |
| adjusted_r2 | DOUBLE | Adjusted R^2 value. |
| rmse | DOUBLE | Root mean square error. |
| mae | DOUBLE | Mean absolute error. |
| mape | DOUBLE | Mean absolute percentage error. |

## sys.dbscan_models

This table contains all model parameters for Density-Based Spatial Clustering of Applications with Noise (DBSCAN) models in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| machine_learning_model_id | UUID | Universally Unique IDentifier (UUID) of the machine learning model (sys.machine_learning_models). |
| num_features | INT | Number of feature columns the DBSCAN model trains on. |
| epsilon | DOUBLE | Distance threshold for the eps-neighborhood. |
| min_pts | INT | Minimum neighbors (including self) required for core-point status. |

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| metric | CHAR | Distance metric with values: ‘euclidean’ (Euclidean), ‘cosine’ (Cosine), or ‘manhattan’ (Manhattan). |
| k_neighbors | INT | Internal KNN graph k that the model uses at training time. |
| insert_batch_size | LONG | Chunk size the database uses when materializing the cores table at the end of training: each multi-row `INSERT INTO temp.<clmap> VALUES (...)` statement holds at most this many `(row_id, cluster_id)` pairs. The default value is 131072 (result of 128 * 1024). |
| num_clusters | INT | Number of clusters the model discovers. Excludes the noise label -1. |
| num_noise_points | LONG | Count of noise rows (cluster identifier -1) the model observes during training. |
| num_core_points | LONG | Count of core points the model classifies. |
| num_border_points | LONG | Count of border points the model observes during training. |
| cluster_sizes | ARRAY(LONG) | Per-cluster training row counts (excludes noise). Index is the cluster identifier. |
| feature_names | ARRAY(CHAR) | Per-feature column names the model captures at training time. This value is empty when the source `SELECT` SQL statement does not name the column. |
| silhouette | DOUBLE | Silhouette coefficient over the assigned (non-noise) training rows. A higher value is better. This value is NULL when the model forms fewer than two clusters. |
| davies_bouldin | DOUBLE | Davies-Bouldin index. A lower value is better. This value is NULL when the model forms fewer than two clusters. |
| calinski_harabasz | DOUBLE | Calinski-Harabasz score. A higher value is better. This value is NULL when the model forms fewer than two clusters. |
| wcss | DOUBLE | Sum of squared distances from each assigned (non-noise) row to its cluster centroid in the normalized feature space. |

## sys.decision_tree_models

This table contains all model parameters for Decision Tree Models in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| machine_learning_model_id | UUID | Universally Unique IDentifier (UUID) of the machine learning model (sys.machine_learning_models). |
| case_statement | CHAR | The case statement that defines the decision tree. |
| case_statement_confidence | CHAR | The case statement that defines the decision tree and returns confidences. |
| num_arguments | INT | Number of arguments in the machine learning model data. |
| argument_types | ARRAY(CHAR) | Argument type names. |
| output_type | CHAR | Output type name. |
| disable_jit | BOOLEAN | Determines whether to disable JIT for the decision tree. Set this value to `true` to disable JIT. The default value is `false`. |
| accuracy | DOUBLE | Fraction of training data that the decision tree model correctly classifies. |
| classes | ARRAY(CHAR) | Distinct output classes. |
| confusion_matrix | ARRAY(ARRAY(LONG)) | Confusion matrix, where the element ith row and jth column denotes the number of actual class i that were predicted to be j. |
| per_class_precision | ARRAY(DOUBLE) | Precisions per class using One-vs-Rest (OVR) calculations. |
| per_class_recall | ARRAY(DOUBLE) | Recalls per class using OVR calculations. |
| per_class_f1 | ARRAY(DOUBLE) | F1 scores per class using OVR calculations. |
| macro_precision | DOUBLE | Average precision over all classes. |
| macro_recall | DOUBLE | Average recall over all classes. |
| macro_f1 | DOUBLE | Average F1 score over all classes. |
| weighted_precision | DOUBLE | Average precision over all classes, weighted by class count. |
| weighted_recall | DOUBLE | Average recall over all classes, weighted by class count. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| weighted_f1 | DOUBLE | Average F1 score over all classes, weighted by class count. |
| mcc | DOUBLE | Matthews correlation coefficient. |
| per_class_auc_roc | ARRAY(DOUBLE) | Areas under the Receiver Operating Characteristic (ROC) curve for each class, calculated using the One-vs-Rest (OVR) methodology. |
| macro_auc_roc | DOUBLE | Average area under the ROC curve across all classes. |
| weighted_auc_roc | DOUBLE | Average area under the ROC curve across all classes, weighted by class count. |
| feature_importances | ARRAY(DOUBLE) | Feature importances for each input feature. |

## sys.feature_selection_models

This table contains parameters of every Backward Feature Elimination and Forward Feature Selection model in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| machine_learning_model_id | UUID | Universally Unique IDentifier (UUID) of the machine learning model (sys.machine_learning_models). |
| model_kind | CHAR | Search direction of the wrapper model with values: `BACKWARD` (backward) or `FORWARD` (forward). |
| inner_model_name | CHAR | Qualified name of the surviving inner model. |
| inner_model_type | CHAR | Model type of the surviving inner model. |
| evaluation_metric | CHAR | The criterion that drives the search loop. |
| metric_direction | CHAR | Direction of the metric with values: `higher_is_better` (higher is better) or `lower_is_better` (lower is better). |
| num_features_total | INT | Total number of features the wrapper model considers. |
| num_features_selected | INT | Number of features in the final selected subset. |
| selected_column_indices | ARRAY(INT) | Indexes of the selected parent input columns. The index starts at 1. |

| Column Name | Column Type | Column Description |
|---|---|---|
| reference_score | DOUBLE | Score of the full-feature reference model. This value is NULL if no reference model was trained. |
| final_score | DOUBLE | Score of the final selected subset on the configured `evaluationMetric` option. |
| num_iterations_run | INT | Number of search rounds executed. |
| num_trials_run | INT | Total number of trial models trained across all rounds. |
| accuracy | DOUBLE | Classification accuracy of the final selected model. This value is NULL for regression and when you do not request metrics. |
| f1_macro | DOUBLE | Macro-averaged F1 score of the final selected model. This value is NULL for regression and when you do not request metrics. |
| auc_roc_macro | DOUBLE | Macro-averaged AUC ROC of the final selected model. This value is NULL for regression and when you do not request metrics. |
| mcc | DOUBLE | Matthews correlation coefficient of the final selected model. This value is NULL for regression and when you do not request metrics. |
| rmse | DOUBLE | Root mean squared error of the final selected model. This value is NULL for classification and when you do not request metrics. |
| mae | DOUBLE | Mean absolute error of the final selected model. This value is NULL for classification and when you do not request metrics. |
| r_squared | DOUBLE | R-squared of the final selected model. This value is NULL for classification and when you do not request metrics. |

## sys.feature_selection_steps

This table contains the per-accepted-move trace for every Backward Feature Elimination and Forward Feature Selection model in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| machine_learning_model_id | UUID | Universally Unique IDentifier (UUID) of the parent feature-selection machine learning model (sys.feature_selection_models). |

| Column Name | Column Type | Column Description |
|---|---|---|
| step_index | INT | Zero-based index of this step in the accepted-move trace. |
| move_kind | CHAR | Specifies the action of the move with values: `ADD`, `REMOVE`, or `INITIAL`. |
| moved_column | INT | Index of the column added or removed by this step. The index starts at 1. This value is NULL for the initial step. |
| selected_after | ARRAY(INT) | Indexes of the columns selected after this step. Index starts at 1. |
| score_after | DOUBLE | Score of the selected subset after this step on the configured `evaluationMetric` option. |
| trials_in_round | INT | Number of trial models trained during the round that produced this step. |

## sys.feedforward_network_models

This table contains all model parameters for Feedforward Neural Network Models in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| machine_learning_model_id | UUID | Universally Unique IDentifier (UUID) of the machine learning model (sys.machine_learning_models). |
| coefficients | ARRAY(DOUBLE) | List of coefficients associated with the feedforward network model. |
| num_arguments | INT | Number of arguments in the machine learning model data. |
| average_loss | DOUBLE | Average value of the loss function. |

## sys.gaussian_discriminant_analysis_models

This table contains all model parameters for Gaussian Discriminant Analysis (GDA) classification models in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| machine_learning_model_id | UUID | Universally Unique IDentifier (UUID) of the machine learning model |

| Column Name | Column Type | Column Description |
|---|---|---|
| | | (sys.machine_learning_models). |
| num_features | INT | Number of features the GDA model trains on. |
| classes | ARRAY(CHAR) | Class labels in the order they appear in the per-class model arrays. |
| class_means | ARRAY(ARRAY(DOUBLE)) | Per-class mean vectors in the normalized feature space of the model. The outer index is the class and the inner index is the feature. |
| log_dets | ARRAY(DOUBLE) | Per-class log determinant of the (regularized) covariance matrix in the normalized feature space. |
| log_priors | ARRAY(DOUBLE) | Per-class log prior probability the model uses during inference. |
| feature_means | ARRAY(DOUBLE) | Means the model uses at training time to normalize each input feature. When you set the `normalize` option to `false`, the values are identity values. |
| feature_stddevs | ARRAY(DOUBLE) | Standard deviations the model uses at training time to normalize each input feature. When you set the `normalize` option to `false`, the values are identity values. |
| accuracy | DOUBLE | Fraction of validation rows the model classifies correctly. |
| metrics_classes | ARRAY(CHAR) | Distinct output classes from metrics computation. |
| confusion_matrix | ARRAY(ARRAY(LONG)) | Confusion matrix, where the element at the ith row and jth column denotes the number of actual class i predicted to be class j. |
| per_class_precision | ARRAY(DOUBLE) | Precision per class using One-vs-Rest (OvR) calculations. |
| per_class_recall | ARRAY(DOUBLE) | Recall per class using OvR calculations. |
| per_class_f1 | ARRAY(DOUBLE) | F1 per class using OvR calculations. |
| macro_precision | DOUBLE | Average precision over all classes. |
| macro_recall | DOUBLE | Average recall over all classes. |
| macro_f1 | DOUBLE | Average F1 over all classes. |
| weighted_precision | DOUBLE | Average precision over all classes weighted by class count. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| weighted_recall | DOUBLE | Average recall over all classes weighted by class count. |
| weighted_f1 | DOUBLE | Average F1 over all classes weighted by class count. |
| mcc | DOUBLE | Multi-class Matthews correlation coefficient. |
| per_class_auc_roc | ARRAY(DOUBLE) | Per-class AUC ROC the model computes against shifted-softmax probabilities. |
| macro_auc_roc | DOUBLE | Unweighted average AUC ROC across classes. |
| weighted_auc_roc | DOUBLE | Class-count-weighted average AUC ROC across classes. |

## sys.gaussian_mixture_models

This table contains all model parameters for Gaussian Mixture Models.

| Column Name | Column Type | Column Description |
|---|---|---|
| machine_learning_model_id | UUID | Universally Unique IDentifier (UUID) of the machine learning model (sys.machine_learning_models). |
| coefficients | ARRAY(DOUBLE) | List of coefficients associated with the Gaussian Mixture Model. |
| num_distributions | INT | Number of distributions in the Gaussian Mixture Model. |
| average_loss | DOUBLE | Average value of the loss function. |
| log_likelihood | DOUBLE | Log-likelihood score of the Gaussian Mixture Model. |

## sys.gradient_boosted_trees_models

This table contains all model parameters for Gradient Boosted Trees Models in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| machine_learning_model_id | UUID | Universally Unique IDentifier (UUID) of the machine learning model (sys.machine_learning_models). |

| Column Name | Column Type | Column Description |
|---|---|---|
| expression | CHAR | The SQL expression that defines the gradient boosted tree. |
| num_arguments | INT | Number of arguments in the machine learning model data. |
| initial_predictions | ARRAY(DOUBLE) | Initial predictions. |
| learning_rate | DOUBLE | Learning rate. |
| loss_function | CHAR | Loss function. |
| feature_importances | ARRAY(DOUBLE) | Feature importances for each input feature. |
| accuracy | DOUBLE | Fraction of training data that the gradient boosted trees model correctly classifies. |
| classes | ARRAY(CHAR) | Distinct output classes. |
| confusion_matrix | ARRAY(ARRAY(LONG)) | Confusion matrix, where the element ith row and jth column denotes the number of actual class i that were predicted to be j. |
| per_class_precision | ARRAY(DOUBLE) | Precisions per class using One-vs-Rest (OVR) calculations. |
| per_class_recall | ARRAY(DOUBLE) | Recalls per class using OVR calculations. |
| per_class_f1 | ARRAY(DOUBLE) | F1 scores per class using OVR calculations. |
| macro_precision | DOUBLE | Average precision over all classes. |
| macro_recall | DOUBLE | Average recall over all classes. |
| macro_f1 | DOUBLE | Average F1 score over all classes. |
| weighted_precision | DOUBLE | Average precision over all classes, weighted by class count. |
| weighted_recall | DOUBLE | Average recall over all classes, weighted by class count. |
| weighted_f1 | DOUBLE | Average F1 score over all classes, weighted by class count. |
| mcc | DOUBLE | Matthews correlation coefficient. |
| per_class_auc_roc | ARRAY(DOUBLE) | Areas under the Receiver Operating Characteristic (ROC) curve for each class, calculated using the One-vs-Rest (OVR) methodology. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| macro_auc_roc | DOUBLE | Average area under the ROC curve across all classes. |
| weighted_auc_roc | DOUBLE | Average area under the ROC curve across all classes, weighted by class count. |
| r2 | DOUBLE | R^2 value. |
| adjusted_r2 | DOUBLE | Adjusted R^2 value. |
| rmse | DOUBLE | Root mean square error. |
| mae | DOUBLE | Mean absolute error. |
| mape | DOUBLE | Mean absolute percentage error. |

## sys.k_means_models

This table contains all model parameters for K-Means Clustering Models in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| machine_learning_model_id | UUID | Universally Unique IDentifier (UUID) of the machine learning model (sys.machine_learning_models). |
| centroids | ARRAY(DOUBLE) | Values that represent the centroid values of each cluster. |
| num_arguments | INT | Number of arguments in the machine learning model data. |
| means | ARRAY(DOUBLE) | Means of each of the feature columns in the data. |
| standard_deviations | ARRAY(DOUBLE) | Standard deviations of each of the feature columns in the data. |
| wcss | DOUBLE | Within-cluster sum of squares score for the model. |

## sys.k_nearest_neighbors_models

This table contains the number of arguments and the target table for K-Nearest Neighbors Models in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| machine_learning_model_id | UUID | Universally Unique IDentifier (UUID) of the machine learning model |

| Column Name | Column Type | Column Description |
|---|---|---|
| | | (sys.machine_learning_models). |
| num_arguments | INT | Number of arguments in the machine learning model data. |
| table_name | CHAR | Name of the target table for the K Nearest Neighbors (KNN) model. |
| means | ARRAY(DOUBLE) | Means of each of the feature columns in the data. |
| standard_deviations | ARRAY(DOUBLE) | Standard deviations of each of the feature columns in the data. |
| accuracy | DOUBLE | Fraction of training data that the KNN model correctly classifies. |
| classes | ARRAY(CHAR) | Distinct output classes. |
| confusion_matrix | ARRAY(ARRAY(LONG)) | Confusion matrix, where the element ith row and jth column denotes the number of actual class i that were predicted to be j. |
| per_class_precision | ARRAY(DOUBLE) | Precisions per class using One-vs-Rest (OVR) calculations. |
| per_class_recall | ARRAY(DOUBLE) | Recalls per class using OVR calculations. |
| per_class_f1 | ARRAY(DOUBLE) | F1 scores per class using OVR calculations. |
| macro_precision | DOUBLE | Average precision over all classes. |
| macro_recall | DOUBLE | Average recall over all classes. |
| macro_f1 | DOUBLE | Average F1 score over all classes. |
| weighted_precision | DOUBLE | Average precision over all classes, weighted by class count. |
| weighted_recall | DOUBLE | Average recall over all classes, weighted by class count. |
| weighted_f1 | DOUBLE | Average F1 score over all classes, weighted by class count. |
| mcc | DOUBLE | Matthews correlation coefficient. |

## sys.linear_combination_regression_models

This table contains all model parameters for Linear Combination Regression Models in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| machine_learning_model_id | UUID | Universally Unique IDentifier (UUID) of the machine learning model (sys.machine_learning_models). |
| coefficients | ARRAY(DOUBLE) | List of model coefficients associated with the regression. |
| y_intercept | DOUBLE | y-intercept of the regression. |
| num_arguments | INT | Number of arguments in the machine learning model data. |
| r2 | DOUBLE | R^2 value. |
| adjusted_r2 | DOUBLE | Adjusted R^2 value. |
| rmse | DOUBLE | Root mean square error. |
| mae | DOUBLE | Mean absolute error. |
| mape | DOUBLE | Mean absolute percentage error. |
| aic | DOUBLE | Akaike information criterion value. |
| bic | DOUBLE | Bayesian information criterion value. |
| optimizer_used | CHAR | Optimizer used during training: ‘closed_form’, ‘fista’, or ‘irls_huber’. NULL for models trained before this column was added. |
| iterations_used | INT | Number of iterations the iterative optimizer used during training. NULL for the closed-form path or for models trained before this column was added. |
| converged | BOOLEAN | Whether the iterative optimizer converged before reaching its iteration cap. NULL for the closed-form path or for models trained before this column was added. |
| huber_outlier_count | LONG | Number of training rows whose final residual exceeded the effective Huber threshold (delta * sigma). Populated only when lossFunction=‘huber’. |

## sys.linear_discriminant_analysis_models

This table contains all model parameters for Linear Discriminant Analysis (LDA) Models in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| machine_learning_model_id | UUID | Universally Unique IDentifier (UUID) of the machine learning model (sys.machine_learning_models). |
| coefficients | ARRAY(DOUBLE) | List of coefficients associated with the LDA model. |
| num_features | INT | Number of features returned by the LDA model. |
| importance | ARRAY(DOUBLE) | Importance of each of the output features that represent the data. |

## sys.logistic_regression_models

This table contains all model parameters for Logistic Regression Models in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| machine_learning_model_id | UUID | Universally Unique IDentifier (UUID) of the machine learning model (sys.machine_learning_models). |
| coefficients | ARRAY(DOUBLE) | List of coefficients associated with the logistic regression model. |
| num_arguments | INT | Number of arguments in the machine learning model data. |
| zero_case | CHAR | The case where the logistic regression uses a value of 0. |
| one_case | CHAR | The case where the logistic regression uses a value of 1. |
| classes | ARRAY(CHAR) | Target classes for the logistic regression. |
| accuracy | DOUBLE | Fraction of training data that the logistic regression model correctly classifies. |
| metrics_classes | ARRAY(CHAR) | Distinct output classes from metrics computation. |
| confusion_matrix | ARRAY(ARRAY(LONG)) | Confusion matrix, where the element ith row and jth column denotes the number of actual class i that were predicted to be j. |
| per_class_precision | ARRAY(DOUBLE) | Precisions per class using One-vs-Rest (OVR) calculations. |
| per_class_recall | ARRAY(DOUBLE) | Recalls per class using OVR calculations. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| per_class_f1 | ARRAY(DOUBLE) | F1 scores per class using OVR calculations. |
| macro_precision | DOUBLE | Average precision over all classes. |
| macro_recall | DOUBLE | Average recall over all classes. |
| macro_f1 | DOUBLE | Average F1 score over all classes. |
| weighted_precision | DOUBLE | Average precision over all classes, weighted by class count. |
| weighted_recall | DOUBLE | Average recall over all classes, weighted by class count. |
| weighted_f1 | DOUBLE | Average F1 score over all classes, weighted by class count. |
| mcc | DOUBLE | Matthews correlation coefficient. |
| per_class_auc_roc | ARRAY(DOUBLE) | Areas under the Receiver Operating Characteristic (ROC) curve for each class, calculated using the One-vs-Rest (OVR) methodology. |
| macro_auc_roc | DOUBLE | Average area under the ROC curve across all classes. |
| weighted_auc_roc | DOUBLE | Average area under the ROC curve across all classes, weighted by class count. |

## sys.machine_learning_model_options

This table contains options defined for each machine learning model. The database stores these options as key-value pairs.

| Column Name | Column Type | Column Description |
|---|---|---|
| machine_learning_model_id | UUID | UUID of the machine learning model (sys.machine_learning_models). |
| machine_learning_model_key | CHAR | Machine learning model configuration option key. |
| machine_learning_model_value | CHAR | Machine learning model configuration option value. |

## sys.machine_learning_models

This table contains the machine learning models that are defined in the database.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | Universally Unique IDentifier (UUID) of the machine learning model. |
| name | CHAR | Name of the machine learning model. |
| schema | CHAR | Schema of the machine learning model. |
| machine_learning_model_type | CHAR | Type of the machine learning model. |
| database_id | UUID | UUID of the database that contains the machine learning model definition (sys.databases). |
| on_select | CHAR | The SELECT SQL statement used to create this model. |
| creator_id | UUID | The UUID of the user or group who created the machine learning model (sys.users/sys.groups). |

## sys.mlp_models

This table contains all model parameters for Multi-Layer Perceptron (MLP) Models in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| machine_learning_model_id | UUID | Universally Unique IDentifier (UUID) of the machine learning model (sys.machine_learning_models). |
| coefficients | ARRAY(DOUBLE) | List of coefficients associated with the MLP model. |
| num_arguments | INT | Number of arguments in the machine learning model data. |
| average_loss | DOUBLE | Average value of the loss function. |

## sys.multiple_linear_regression_models

This table contains the y-intercept and coefficient of determination values for the multiple linear regression machine learning models.

| Column Name | Column Type | Column Description |
|---|---|---|
| machine_learning_model_id | UUID | Universally Unique IDentifier (UUID) of the machine learning model (sys.machine_learning_models). |
| y_intercept | DOUBLE | y-intercept of the regression. |
| slopes | ARRAY(DOUBLE) | Slopes for each variable in the regression. |
| r2 | DOUBLE | R^2 value. |
| adjusted_r2 | DOUBLE | Adjusted R^2 value. |
| rmse | DOUBLE | Root mean square error. |
| mae | DOUBLE | Mean absolute error. |
| mape | DOUBLE | Mean absolute percentage error. |
| aic | DOUBLE | Akaike information criterion value. |
| bic | DOUBLE | Bayesian information criterion value. |
| optimizer_used | CHAR | Optimizer used during training: ‘closed_form’, ‘fista’, or ‘irls_huber’. NULL for models trained before this column was added. |
| iterations_used | INT | Number of iterations the iterative optimizer used during training. NULL for the closed-form path or for models trained before this column was added. |
| converged | BOOLEAN | Whether the iterative optimizer converged before reaching its iteration cap. NULL for the closed-form path or for models trained before this column was added. |
| huber_outlier_count | LONG | Number of training rows whose final residual exceeded the effective Huber threshold (delta * sigma). Populated only when lossFunction=‘huber’. |

## sys.naive_bayes_models

This table contains all model parameters for Naive Bayes Classification Models in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| machine_learning_model_id | UUID | Universally Unique IDentifier (UUID) of the machine learning model (sys.machine_learning_models). |

| Column Name | Column Type | Column Description |
|---|---|---|
| num_arguments | INT | Number of arguments in the machine learning model data. |
| result_probability_table | CHAR | Name of the internal result probability table. |
| feature_result_matrix_table | CHAR | Name of the internal feature result matrix table. |
| accuracy | DOUBLE | Fraction of training data that the Naive Bayes model correctly classifies. |
| classes | ARRAY(CHAR) | Distinct output classes from metrics computation. |
| confusion_matrix | ARRAY(ARRAY(LONG)) | Confusion matrix, where the element ith row and jth column denotes the number of actual class i that were predicted to be j. |
| per_class_precision | ARRAY(DOUBLE) | Precisions per class using One-vs-Rest (OVR) calculations. |
| per_class_recall | ARRAY(DOUBLE) | Recalls per class using OVR calculations. |
| per_class_f1 | ARRAY(DOUBLE) | F1 scores per class using OVR calculations. |
| macro_precision | DOUBLE | Average precision over all classes. |
| macro_recall | DOUBLE | Average recall over all classes. |
| macro_f1 | DOUBLE | Average F1 score over all classes. |
| weighted_precision | DOUBLE | Average precision over all classes, weighted by class count. |
| weighted_recall | DOUBLE | Average recall over all classes, weighted by class count. |
| weighted_f1 | DOUBLE | Average F1 score over all classes, weighted by class count. |
| mcc | DOUBLE | Matthews correlation coefficient. |

## sys.nonlinear_regression_models

This table contains all model parameters for Nonlinear Regression Models in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| machine_learning_model_id | UUID | Universally Unique IDentifier (UUID) of the machine learning model (sys.machine_learning_models). |

| Column Name | Column Type | Column Description |
|---|---|---|
| coefficients | ARRAY(DOUBLE) | List of coefficients associated with the nonlinear regression model. |
| num_arguments | INT | Number of arguments in the machine learning model data. |
| r2 | DOUBLE | R^2 value. |
| adjusted_r2 | DOUBLE | Adjusted R^2 value. |
| rmse | DOUBLE | Root mean square error. |
| mae | DOUBLE | Mean absolute error. |
| mape | DOUBLE | Mean absolute percentage error. |
| aic | DOUBLE | Akaike information criterion value. |
| bic | DOUBLE | Bayesian information criterion value. |
| constraints | CHAR | The SQL Boolean predicate over `a1..aN` that the model uses for training. This value is NULL when you create the model without this option set to the `OPTIONS` value, or for models the system trains before the addition of this column. |
| accepted_steps | LONG | Count of optimizer steps that satisfy the constraint predicate during training. This value is NULL when you create the model without this option set to the `OPTIONS` value. |
| rejected_steps | LONG | Count of optimizer steps that violate the constraint predicate and that the model rejects during training. This value is NULL when you create the model without this option set to the `OPTIONS` value. |
| final_lambda | DOUBLE | Final Levenberg-Marquardt damping factor at the training termination. This value is NULL for Adam-trained models (set the `lossFunction` option to a function that is different from the default least-squares form) or when you create the model without this option set to the `OPTIONS` value. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| constraint_infeasible | BOOLEAN | Determines whether the constraint is infeasible. This value is `true` if training terminates because the optimizer hit the number of consecutive constraint-rejected steps that you specify using the `maxConsecutiveRejections` option without an accept (constraint surface is unreachable from the chosen starting point). This value is NULL when you create the model without this option set to the `OPTIONS` value. |

## sys.polynomial_regression_models

This table contains all model parameters for Polynomial Regression Models in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| machine_learning_model_id | UUID | Universally Unique IDentifier (UUID) of the machine learning model (sys.machine_learning_models). |
| coefficients | ARRAY(DOUBLE) | List of model coefficients associated with the polynomial regression model. |
| y_intercept | DOUBLE | y-intercept of the regression. |
| num_arguments | INT | Number of arguments in the machine learning model data. |
| r2 | DOUBLE | R^2 value. |
| adjusted_r2 | DOUBLE | Adjusted R^2 value. |
| rmse | DOUBLE | Root mean square error. |
| mae | DOUBLE | Mean absolute error. |
| mape | DOUBLE | Mean absolute percentage error. |
| aic | DOUBLE | Akaike information criterion value. |
| bic | DOUBLE | Bayesian information criterion value. |
| optimizer_used | CHAR | Optimizer used during training: ‘closed_form’, ‘fista’, or ‘irls_huber’. NULL for models trained before this column was added. |
| iterations_used | INT | Number of iterations the iterative optimizer used during training. NULL for the closed-form path or for models trained before this column was added. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| converged | BOOLEAN | Whether the iterative optimizer converged before reaching its iteration cap. NULL for the closed-form path or for models trained before this column was added. |
| huber_outlier_count | LONG | Number of training rows whose final residual exceeded the effective Huber threshold (delta * sigma). Populated only when lossFunction='huber'. |

## sys.principal_component_analysis_models

This table contains all model parameters for Principal Component Analysis (PCA) Models in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| machine_learning_model_id | UUID | Universally Unique IDentifier (UUID) of the machine learning model (sys.machine_learning_models). |
| coefficients | ARRAY(DOUBLE) | List of coefficients associated with the PCA model. |
| num_features | INT | Number of features returned by the PCA model. |
| importance | ARRAY(DOUBLE) | Importance of each of the output features that represents the data. |
| means | ARRAY(DOUBLE) | Means of each of the feature columns in the data. |
| standard_deviations | ARRAY(DOUBLE) | Standard deviations of each of the feature columns in the data. |
| num_components | INT | Number of principal components retained by the model. |
| whiten | BOOLEAN | Whether the model scales component scores by the inverse square root of eigenvalues. |
| eigenvalues | ARRAY(DOUBLE) | Eigenvalues for each principal component. |

## sys.random_forest_models

This table contains all model parameters for Random Forest Models in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| machine_learning_model_id | UUID | Universally Unique IDentifier (UUID) of the machine learning model (sys.machine_learning_models). |
| vote_expression | CHAR | The vote expression that retrieves information from the child decision trees. |
| vote_expression_confidence | CHAR | The vote expression that retrieves information from the child decision trees and returns confidences. |
| num_arguments | INT | Number of arguments in the machine learning model data. |
| num_children | INT | Number of child trees in the forest. |
| feature_importances | ARRAY(DOUBLE) | Feature importances for each input feature. |
| oob_score | DOUBLE | Out-of-bag score of the random forest model. |
| accuracy | DOUBLE | Fraction of training data that the random forest model correctly classifies. |
| classes | ARRAY(CHAR) | Distinct output classes from metrics computation. |
| confusion_matrix | ARRAY(ARRAY(LONG)) | Confusion matrix, where the element ith row and jth column denotes the number of actual class i that were predicted to be j. |
| per_class_precision | ARRAY(DOUBLE) | Precisions per class using One-vs-Rest (OVR) calculations. |
| per_class_recall | ARRAY(DOUBLE) | Recalls per class using OVR calculations. |
| per_class_f1 | ARRAY(DOUBLE) | F1 scores per class using OVR calculations. |
| macro_precision | DOUBLE | Average precision over all classes. |
| macro_recall | DOUBLE | Average recall over all classes. |
| macro_f1 | DOUBLE | Average F1 score over all classes. |
| weighted_precision | DOUBLE | Average precision over all classes, weighted by class count. |
| weighted_recall | DOUBLE | Average recall over all classes, weighted by class count. |
| weighted_f1 | DOUBLE | Average F1 score over all classes, weighted by class count. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| mcc | DOUBLE | Matthews correlation coefficient. |
| per_class_auc_roc | ARRAY(DOUBLE) | Areas under the Receiver Operating Characteristic (ROC) curve for each class, calculated using the One-vs-Rest (OVR) methodology. |
| macro_auc_roc | DOUBLE | Average area under the ROC curve across all classes. |
| weighted_auc_roc | DOUBLE | Average area under the ROC curve across all classes, weighted by class count. |

## sys.regression_tree_models

This table contains all model parameters for Regression Tree Models in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| machine_learning_model_id | UUID | Universally Unique IDentifier (UUID) of the machine learning model (sys.machine_learning_models). |
| case_statement | CHAR | The case statement that defines the regression tree. |
| num_arguments | INT | Number of arguments in the machine learning model data. |
| r2 | DOUBLE | R^2 value. |
| adjusted_r2 | DOUBLE | Adjusted R^2 value. |
| rmse | DOUBLE | Root mean square error. |
| mae | DOUBLE | Mean absolute error. |
| mape | DOUBLE | Mean absolute percentage error. |
| feature_importances | ARRAY(DOUBLE) | Feature importances for each input feature. |

## sys.simple_linear_regression_models

This table contains the slope, y-intercept, and coefficient of determination values for single linear regression machine learning models.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| machine_learning_model_id | UUID | Universally Unique IDentifier (UUID) of the machine learning model (sys.machine_learning_models). |
| slope | DOUBLE | Slope of the regression. |
| y_intercept | DOUBLE | The y-intercept of the regression. |
| r2 | DOUBLE | R^2 value. |
| adjusted_r2 | DOUBLE | Adjusted R^2 value. |
| rmse | DOUBLE | Root mean square error. |
| mae | DOUBLE | Mean absolute error. |
| mape | DOUBLE | Mean absolute percentage error. |
| aic | DOUBLE | Akaike information criterion value. |
| bic | DOUBLE | Bayesian information criterion value. |

## sys.stacking_models

This table contains all model parameters for Stacking Models in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| machine_learning_model_id | UUID | Universally Unique IDentifier (UUID) of the machine learning model (sys.machine_learning_models). |
| num_arguments | INT | Number of arguments in the machine learning model data. |
| accuracy | DOUBLE | Fraction of training data that the stacking model correctly classifies. |
| classes | ARRAY(CHAR) | Distinct output classes from metrics computation. |
| confusion_matrix | ARRAY(ARRAY(LONG)) | Confusion matrix, where the element ith row and jth column denotes the number of actual class i that were predicted to be j. |
| per_class_precision | ARRAY(DOUBLE) | Precisions per class using One-vs-Rest (OVR) calculations. |
| per_class_recall | ARRAY(DOUBLE) | Recalls per class using OVR calculations. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| per_class_f1 | ARRAY(DOUBLE) | F1 scores per class using OVR calculations. |
| macro_precision | DOUBLE | Average precision over all classes. |
| macro_recall | DOUBLE | Average recall over all classes. |
| macro_f1 | DOUBLE | Average F1 score over all classes. |
| weighted_precision | DOUBLE | Average precision over all classes, weighted by class count. |
| weighted_recall | DOUBLE | Average recall over all classes, weighted by class count. |
| weighted_f1 | DOUBLE | Average F1 score over all classes, weighted by class count. |
| mcc | DOUBLE | Matthews correlation coefficient. |
| r2 | DOUBLE | R^2 value. |
| adjusted_r2 | DOUBLE | Adjusted R^2 value. |
| rmse | DOUBLE | Root mean square error. |
| mae | DOUBLE | Mean absolute error. |
| mape | DOUBLE | Mean absolute percentage error. |

## sys.support_vector_machine_models

This table contains all model parameters for Support Vector Machine (SVM) Models in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| machine_learning_model_id | UUID | Universally Unique IDentifier (UUID) of the machine learning model (sys.machine_learning_models). |
| coefficients | ARRAY(DOUBLE) | List of coefficients associated with the SVM model. |
| num_arguments | INT | Number of arguments in the machine learning model data. |
| negative_case | CHAR | Case when the SVM model classifies data as negative. |

| Column Name | Column Type | Column Description |
|---|---|---|
| positive_case | CHAR | Case when the SVM model classifies data as positive. |
| classes | ARRAY(CHAR) | Target classes for the SVM model. |
| accuracy | DOUBLE | Fraction of training data that the SVM model correctly classifies. |
| metrics_classes | ARRAY(CHAR) | Distinct output classes from metrics computation. |
| confusion_matrix | ARRAY(ARRAY(LONG)) | Confusion matrix, where the element ith row and jth column denotes the number of actual class i that were predicted to be j. |
| per_class_precision | ARRAY(DOUBLE) | Precisions per class using One-vs-Rest (OVR) calculations. |
| per_class_recall | ARRAY(DOUBLE) | Recalls per class using OVR calculations. |
| per_class_f1 | ARRAY(DOUBLE) | F1 scores per class using OVR calculations. |
| macro_precision | DOUBLE | Average precision over all classes. |
| macro_recall | DOUBLE | Average recall over all classes. |
| macro_f1 | DOUBLE | Average F1 score over all classes. |
| weighted_precision | DOUBLE | Average precision over all classes, weighted by class count. |
| weighted_recall | DOUBLE | Average recall over all classes, weighted by class count. |
| weighted_f1 | DOUBLE | Average F1 score over all classes, weighted by class count. |
| mcc | DOUBLE | Matthews correlation coefficient. |
| per_class_auc_roc | ARRAY(DOUBLE) | Areas under the Receiver Operating Characteristic (ROC) curve for each class, calculated using the One-vs-Rest (OVR) methodology. |
| macro_auc_roc | DOUBLE | Average area under the ROC curve across all classes. |
| weighted_auc_roc | DOUBLE | Average area under the ROC curve across all classes, weighted by class count. |

## sys.survival_regression_models

This table contains all model parameters for Survival Regression Models in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| machine_learning_model_id | UUID | Universally Unique IDentifier (UUID) of the machine learning model (sys.machine_learning_models). |
| family | CHAR | Survival regression family with supported values: 'cox' (Cox proportional hazards (PH)) or 'aft' (accelerated failure time). |
| aft_distribution | CHAR | Accelerated Failure Time (AFT) distribution with supported values: 'weibull', 'lognormal', or 'loglogistic'. When you set the `family` option to 'cox', this value is empty. |
| ties | CHAR | Cox proportional hazards ties handling with supported values: 'efron' or 'breslow'. When you set the `family` option to 'aft', this value is empty. |
| coefficients | ARRAY(DOUBLE) | Linear-predictor coefficients (one per feature). This value uses the partial-likelihood coefficients for Cox PH, and the log-time location coefficients for AFT. |
| aft_intercept | DOUBLE | AFT intercept (mu). When you set the `family` option to 'cox', this value is NULL. |
| aft_scale | DOUBLE | AFT scale parameter (sigma). When you set the `family` option to 'cox', this value is NULL. |
| final_log_likelihood | DOUBLE | Partial log-likelihood at convergence when you set the `family` option to 'cox', or full log-likelihood when you set that option to 'aft'. |
| num_arguments | INT | Number of feature columns in the machine learning model data. |
| concordance_index | DOUBLE | The Concordance Index. If the model does not compute metrics, this value is NULL. |

## sys.undersampling_models

This table contains the parameters and the output table name for an Undersampling Preprocessing model. The output table named in the `output_table` column contains sampled rows that downstream classifiers can train against.

| Column Name | Column Type | Column Description |
|---|---|---|
| machine_learning_model_id | UUID | Universally Unique IDentifier (UUID) of the machine learning model (sys.machine_learning_models). |
| class_column | CHAR | Name of the column with the value that defines the class for sampling. |
| strategy | CHAR | Sampling strategy with values: ‘random’ or ‘stratified’. |
| sampling_ratio | DOUBLE | Final majority or minority row count ratio relative to the target class. |
| output_table | CHAR | Name of the output table in the `temp` schema. Read this table to access the sampled rows. The system drops this table when you execute the `DROP MLMODEL` SQL statement. |
| target_class | CHAR | Class label that defines the target row count, specified as either the smallest class (when targetClass=‘auto’) or the explicitly named class. |
| stratum_column | CHAR | Name of the column defining strata when you set the `strategy` option to ‘stratified’. When you set the `strategy` option to ‘random’, this value is empty. |

## sys.vector_autoregression_models

This table contains all model parameters for Vector Autoregression Models in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| machine_learning_model_id | UUID | Universally Unique IDentifier (UUID) of the machine learning model (sys.machine_learning_models). |
| coefficients | ARRAY(DOUBLE) | List of coefficients associated with the vector autoregression model. |
| coefficient_of_determination | DOUBLE | R^2 value of the autoregression, if calculated, otherwise NULL. |
| optimizer_used | CHAR | Optimizer used during training: ‘closed_form’ or ‘fista’. NULL for models trained before this column was added. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| iterations_used | INT | Number of FISTA iterations the optimizer used during training. NULL for the closed-form path or for models trained before this column was added. |
| converged | BOOLEAN | Whether the FISTA optimizer converged before reaching its iteration cap. NULL for the closed-form path or for models trained before this column was added. |

# Model Context Protocol

## sys.mcp_tools

This table contains all of the Model Context Protocol (MCP) tools in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | Universally Unique IDentifier (UUID) of the MCP tool. |
| database_id | UUID | Universally Unique IDentifier (UUID) of the database containing the MCP tool. This value is NULL for system tools. |
| schema | CHAR | Name of the schema. |
| name | CHAR | Name of the MCP tool. |
| argument_names | ARRAY(CHAR) | The argument names of the MCP tool, specified as an array. |
| argument_types | ARRAY(CHAR) | The argument types of the MCP tool, specified as an array. |
| argument_nullability | ARRAY(BOOLEAN) | Whether the argument types for the MCP tool are nullable, specified as an array. |
| language | CHAR | Programming language of the MCP tool. |
| description | CHAR | Description of the MCP tool. |
| toolset | CHAR | Toolset where the MCP tool belongs. |
| definition | CHAR | Function definition of the MCP tool. |
| tool_type | CHAR | Type of the MCP tool with values: `MCP TOOL` for user-defined tools and `SYSTEM MCP TOOL` for system tools. |
| creator_id | UUID | Universally Unique IDentifier (UUID) of the user who created the MCP tool. This value is NULL for system tools. |

© 2026 Ocient, Inc

| Column Name | Column Type | Column Description |
|---|---|---|
| created_at | TIMESTAMP | Timestamp that represents the MCP tool was created. This value is NULL for system tools. |

# Monitoring

## sys.active_operator_instances

This table contains information about operator instances that are active in the database.

| Column Name | Column Type | Column Description |
|---|---|---|
| database_name | CHAR | The name of the database associated with the query to which the operator belongs. |
| user_name | CHAR | The username associated with the query to which the operator belongs. |
| query_id | UUID | A unique identifier of the query to which the operator belongs. |
| operator_id | UUID | A unique identifier of the finalized operator. |
| node_id | UUID | The unique identifier of the node that stores the information about this operator. |
| silo_id | LONG | The unique identifier of the silo that stores the information about this operator. |
| core_id | LONG | The unique identifier of the virtual machine core that stores the information about this operator. |
| op_runtime_id | LONG | The unique identifier for the operator instance that the system assigns at runtime. |
| op_instance_type | CHAR | The name of the type for this operator instance. |

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| bloom_filtered_rows | LONG | The rows filtered by Bloom filters. |
| rows_received | LONG | The number of rows fetched by the operator instance. |
| rows_processed | LONG | The number of rows processed by this operator instance during execution. |
| rows_emitted | LONG | The number of rows returned by the operator instance. |
| blocks_emitted | LONG | The number of data blocks returned by the operator instance. |
| first_block_receive_time | TIMESTAMP | The timestamp that specifies the return of the first data block. |
| first_block_emitted_time | TIMESTAMP | The timestamp that specifies the return of the first data block. |
| num_cycles | LONG | The number of cycles that run on this operator instance. |
| num_oom_cycles | LONG | The number of run cycles that an operator received for processing out-of-memory issues. |
| num_failed_oom_cycles | LONG | The number of out-of-memory cycles received that failed to do any work. |
| num_no_work_oom_cycles | LONG | The number of out-of-memory cycles received that reported they had no work to do. |
| run_count | LONG | The number of times that the scheduler has reviewed this operator and `isRunnable` is set to `true`. |
| no_work_cycles | LONG | The number of times that the read and write cycle executed and performed no work. |

| Column Name | Column Type | Column Description |
|---|---|---|
| backed_up_cycles | LONG | The number of times a cycle stopped because a backup of the parent exists. |
| leaf_branch_blocked_cycles | LONG | The number of times a cycle stopped on a leaf operator because of multi-child scheduling heuristics. |
| num_eof_cycles | LONG | The number of end-of-file cycles received. |
| normal_run_time_in_ms | DOUBLE | The time, in milliseconds, of the normal run for the operator instance. |
| dispatch_queue_time_in_ms | DOUBLE | The time spent, in milliseconds, processing incoming message events for the operator instance. |
| oom_run_time_in_ms | DOUBLE | The time, in milliseconds, of the out-of-memory issue for the operator instance. |
| max_hp_mem_usage | LONG | The maximum heap memory usage by the operator instance. |
| num_blocks_written | LONG | The number of data blocks written to temporary disk. |
| num_blocks_read | LONG | The number of data blocks read from temporary disk. |
| num_fragments_written | LONG | The number of written memory fragments. |
| num_fragments_read | LONG | The number of read memory fragments. |
| cycles_over_1_sec | LONG | The count of cycles that ran over 1 second for this operator instance. |
| cycles_over_3_sec | LONG | The count of cycles that ran over 3 seconds for this operator instance. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| long_dispatch_queue_events | LONG | The count of dispatch queue events processed by the operator with a runtime greater than 0.5 seconds. |
| total_bin_stream_allocated_bytes | LONG | The total amount of memory allocated in output blocks for variable-length column data. |
| total_bin_stream_used_bytes | LONG | The total amount of memory used in output blocks for variable-length column data. |
| total_col_stream_allocated_bytes | LONG | The total amount of memory allocated in output blocks for fixed-length column data. |
| total_col_stream_used_bytes | LONG | The total amount of memory used in output blocks for fixed-length column data. |
| blocked_received | LONG | The total number of input data blocks received by this operator instance. |
| blocked_created | LONG | The total number of non-trivial output data blocks created by this operator instance. |
| received_block_bin_stream_unused_space_bytes | LONG | The total amount of wasted space across all binary streams in received data blocks (includes over-allocations as well as projected columns and dead memory). This number is NULL unless configuration parameters allow recording this statistic for each block because the calculation is expensive. |
| received_block_col_stream_unused_space_bytes | LONG | The total amount of wasted space across all column streams in received data blocks (includes over-allocations as well as projected columns and dead memory). This number is NULL unless configuration parameters allow recording |

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| | | this statistic for each block because the calculation is expensive. |
| mandatory_alloc_attempts | LONG | The count of cycles where the scheduler enabled mandatory allocation. |
| mandatory_alloc_success_count | LONG | The count of cycles where the scheduler enabled mandatory allocation and this operator broke an out-of-memory deadlock. |
| max_num_pending_blocks | LONG | The maximum number of pending blocks across all partitions during the lifetime of this operator. |
| max_num_consecutive_backup_cycles | LONG | The maximum number of consecutive scheduler cycles where this operator has a backup. The scheduler can use this information to help detect certain resource deadlocks. |
| longest_time_since_unblocked_cycle | LONG | The maximum time between successful attempts to run this operator from the scheduler. The scheduler can use this information to help detect certain resource deadlocks. |
| compiled_level | LONG | The level within a hierarchy of distinct operators to execute. A single plan operator can be compiled into this hierarchy. |
| additional_json | CHAR | Additional statistics for an operator instance in JSON format. |
| num_bloom_filters_sent | LONG | The number of Bloom filters the operator sent to its peers. |
| num_bloom_filters_received | LONG | The number of Bloom filters the operator received from its peers. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| num_key_lists_sent | LONG | The number of potential index join key lists the operator sent to its peers. |
| num_key_lists_received | LONG | The number of potential index join key lists the operator received from its peers. |
| max_hash_table_rows | LONG | The maximum number of rows present in any hash table used by this operator instance. |
| plan_operator_estimated_output_cardinality | LONG | The number of rows the optimizer estimated for this plan operator to emit. |
| num_delayed_exceptions_generated | LONG | The number of rows this operator generated with delayed exception information. |
| num_pending_blocks_spilled | LONG | The number of queued pending data blocks this operator spilled to disk. |
| max_normal_cycle_time_ms | DOUBLE | The time, in milliseconds, of the longest normal run cycle for the operator instance. |
| max_oom_cycle_time_ms | DOUBLE | The time, in milliseconds, of the longest out-of-memory run cycle for the operator instance. |
| num_rows_received_per_plan_child | ARRAY(LONG) | The number of rows this operator received from each of its children in the plan. |
| initialization_time | TIMESTAMP | The timestamp that represents when the operator began work. |
| num_cycles_blocked_by_temp_disk | LONG | The count of cycles that the operator spent waiting for input and output from the temporary disk. |
| num_cycles_blocked_by_external_pending_blocks | LONG | The count of cycles that the operator spent waiting for |

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| | | input and output from external pending blocks. |
| blobstore_callback_time_ms | DOUBLE | The time, in milliseconds, the system spends processing callbacks for temporary disk input and output for the operator instance. |
| num_bounding_box_lists_sent | LONG | The number of geospatial bounding box list filters the operator sent to its peers. |
| num_bounding_box_lists_received | LONG | The number of geospatial bounding box list filters the operator received from its peers. |
| target_rows_per_cycle | LONG | The number of rows this operator expects to process in a single cycle without exceeding time limits. |
| applied_dynamic_filter_stats | CHAR | Additional statistics about dynamic pushdown filters in JSON format. |
| is_runnable | BOOLEAN | Whether the operator has available data to process. |
| current_num_pending_blocks | LONG | The current number of pending blocks across all partitions of this operator. |

## sys.active_query_scheduler_info

This table contains information about how the scheduler schedules each query to execute within the virtual machine (VM).

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| query_id | UUID | The Universally Unique IDentifier (UUID) of the query that the scheduler currently schedules to execute. |
| node_id | UUID | The UUID of the node that executes this query. |

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| silo_id | LONG | The identifier of the silo that executes this query on its associated node. |
| core_id | LONG | The identifier of the VM core that executes this query on its associated silo. |
| virtual_runtime | DOUBLE | A unitless fairness metric the scheduler uses to determine the query to schedule next. Comparisons of this value are only meaningful across concurrently executing queries with identical `node_id`, `silo_id`, `core_id`, and `current_priority` values. |
| current_priority | DOUBLE | The current scheduling priority of this query on its VM core. |
| total_cycles | LONG | The number of times this VM core has attempted to schedule this query. |
| successful_cycles | LONG | The number of times this VM core has attempted to schedule this query and completed some amount of work. |
| no_work_cycles | LONG | The number of times this VM core has attempted to schedule this query and no operators were prepared to do work. |
| failed_cycles | LONG | The number of times this VM core has attempted to schedule this query, some operators attempted to do work, and all operators failed to complete any amount of work. |
| failed_oom_cycles | LONG | The number of times this VM core has attempted to schedule this query, some operators attempted to do work, all operators failed to complete any amount of work, and at least one operator on the query has reported that it is out of memory. |
| num_greedy_cycles | LONG | The number of times this VM core has attempted to schedule this query, which is the exclusive highest priority query currently managed by this VM core. |
| num_try_chilled_ops_cycles | LONG | The number of times this VM core attempted to schedule this query and polled operators that have been marked |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| | | as `chilled`, meaning they are unlikely to be prepared to do work. |
| num_successful_try_chilled_ops_cycles | LONG | The number of times this VM core attempted to schedule this query, polled operators that have been marked ‘chilled’, and successfully completed some amount of work. |
| total_op_inst_cycle_time | DOUBLE | The approximate total CPU time, in milliseconds, that the operators in this query have been scheduled to execute on this VM core. |
| total_op_inst_dispatch_queue_time | DOUBLE | The approximate total CPU time, in milliseconds, that operators associated with this query have spent processing incoming message events. |
| total_runtime | DOUBLE | The approximate execution time, in milliseconds, that this VM core has managed this query. |
| total_bytes_spilled | LONG | The approximate total temporary disk amount that the VM core uses during query execution. |

## sys.all_operator_instances

This table contains information about operator instances that have been created by the virtual machine.

| Column Name | Column Type | Column Description |
|---|---|---|
| database_name | VARCHAR | The name of the database associated with the query to which the operator belongs. |
| user_name | VARCHAR | The username associated with the query to which the operator belongs. |
| query_id | UUID | A Universally Unique IDentifier (UUID) of the query to which the operator belongs. |
| operator_id | UUID | The UUID of the finalized operator. |

| Column Name | Column Type | Column Description |
|---|---|---|
| node_id | UUID | The UUID of the node that stores information about this operator. |
| silo_id | BIGINT | The identifier of the silo that stores information about this operator. |
| core_id | BIGINT | The identifier of the virtual machine core that stores information about this operator. |
| op_runtime_id | BIGINT | The identifier for the operator instance that the system assigns at runtime. |
| op_instance_type | VARCHAR | The name of the type for this operator instance. |
| bloom_filtered_rows | BIGINT | The rows filtered by Bloom filters. |
| rows_received | BIGINT | The number of rows fetched by the operator instance. |
| rows_processed | BIGINT | The number of rows processed by this operator instance during execution. |
| rows_emitted | BIGINT | The number of rows returned by the operator instance. |
| blocks_emitted | BIGINT | The number of data blocks returned by the operator instance. |
| finalization_time | TIMESTAMP | The timestamp that represents when the operator completed all work. |
| first_block_receive_time | TIMESTAMP | The timestamp that specifies the receipt of the first data block. |
| first_block_emitted_time | TIMESTAMP | The timestamp that specifies the return of the first data block. |
| num_cycles | BIGINT | The number of cycles that run on this operator instance. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| num_oom_cycles | BIGINT | The number of run cycles that an operator received for processing out-of-memory issues. |
| num_failed_oom_cycles | BIGINT | The number of out-of-memory cycles received that failed to do any work. |
| num_no_work_oom_cycles | BIGINT | The number of out-of-memory cycles received with no work to do. |
| run_count | BIGINT | The number of times that the scheduler has reviewed this operator and `isRunnable` is set to `true`. |
| no_work_cycles | BIGINT | The number of times that the read and write cycle executed and performed no work. |
| backed_up_cycles | BIGINT | The number of times a cycle stopped because a backup of the parent exists. |
| leaf_branch_blocked_cycles | BIGINT | The number of times a cycle stopped on a leaf operator because of multi-child scheduling heuristics. |
| num_eof_cycles | BIGINT | The number of end-of-file cycles received. |
| normal_run_time_in_ms | DOUBLE | The time, in milliseconds, of the normal run for the operator instance. |
| dispatch_queue_time_in_ms | DOUBLE | The time, in milliseconds, spent processing incoming message events for the operator instance. |
| oom_run_time_in_ms | DOUBLE | The time, in milliseconds, of the out-of-memory issue for the operator instance. |
| max_hp_mem_usage | BIGINT | The maximum heap memory usage by the operator instance. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| num_blocks_written | BIGINT | The number of data blocks written to temporary disk. |
| num_blocks_read | BIGINT | The number of data blocks read from temporary disk. |
| num_fragments_written | BIGINT | The number of written memory fragments. |
| num_fragments_read | BIGINT | The number of read memory fragments. |
| cycles_over_1_sec | BIGINT | The count of cycles that ran over 1 second for this operator instance. |
| cycles_over_3_sec | BIGINT | The count of cycles that ran over 3 seconds for this operator instance. |
| long_dispatch_queue_events | BIGINT | The count of dispatch queue events processed by the operator with a runtime greater than 0.5 seconds. |
| total_bin_stream_allocated_bytes | BIGINT | The total amount of memory allocated in output blocks for variable-length column data. |
| total_bin_stream_used_bytes | BIGINT | The total amount of memory used in output blocks for variable-length column data. |
| total_col_stream_allocated_bytes | BIGINT | The total amount of memory allocated in output blocks for fixed-length column data. |
| total_col_stream_used_bytes | BIGINT | The total amount of memory used in output blocks for fixed-length column data. |
| blocked_received | BIGINT | The total number of input data blocks received by this operator instance. |
| blocked_created | BIGINT | The total number of non-trivial output data blocks created by this operator instance. |
| received_block_bin_stream_unused_space_bytes | BIGINT | The total amount of wasted space across all binary streams in received data |

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| | | blocks (includes over-allocations as well as projected columns and dead memory). This number is NULL unless configuration parameters allow recording this statistic for each block because the calculation is expensive. |
| received_block_col_stream_unused_space_bytes | BIGINT | The total amount of wasted space across all column streams in received data blocks (includes over-allocations as well as projected columns and dead memory). This number is NULL unless configuration parameters allow recording this statistic for each block because the calculation is expensive. |
| mandatory_alloc_attempts | BIGINT | The count of cycles where the scheduler enabled mandatory allocation. |
| mandatory_alloc_success_count | BIGINT | The count of cycles where the scheduler enabled mandatory allocation and this operator broke an out-of-memory deadlock. |
| max_num_pending_blocks | BIGINT | The maximum number of pending blocks across all partitions during the lifetime of this operator. |
| max_num_consecutive_backup_cycles | BIGINT | The maximum number of consecutive scheduler cycles where this operator has a backup. The scheduler can use this information to help detect certain resource deadlocks. |
| longest_time_since_unblocked_cycle | BIGINT | The maximum time between successful attempts to run this operator from the scheduler. The scheduler can use this information to help |

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| | | detect certain resource deadlocks. |
| compiled_level | BIGINT | The level within a hierarchy of distinct operators to execute. The system can compile a single plan operator into this hierarchy. |
| additional_json | VARCHAR | Additional statistics for an operator instance in JSON format. |
| num_bloom_filters_sent | BIGINT | The number of Bloom filters the operator sent to its peers. |
| num_bloom_filters_received | BIGINT | The number of Bloom filters the operator received from its peers. |
| num_key_lists_sent | BIGINT | The number of potential index join key lists the operator sent to its peers. |
| num_key_lists_received | BIGINT | The number of potential index join key lists the operator received from its peers. |
| max_hash_table_rows | BIGINT | The maximum number of rows present in any hash table used by this operator instance. |
| plan_operator_estimated_output_cardinality | BIGINT | The number of rows the optimizer estimated for this plan operator to emit. |
| num_delayed_exceptions_generated | BIGINT | The number of rows this operator generated with delayed exception information. |
| num_pending_blocks_spilled | BIGINT | The number of queued pending data blocks this operator spilled to disk. |
| max_normal_cycle_time_ms | DOUBLE | The time, in milliseconds, of the longest normal run cycle for the operator instance. |
| max_oom_cycle_time_ms | DOUBLE | The time, in milliseconds, of the longest out-of-memory |

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| | | run cycle for the operator instance. |
| num_rows_received_per_plan_child | BIGINT[] | The number of rows this operator received from each of its children in the plan. |
| initialization_time | TIMESTAMP | The timestamp that represents when the operator began work. |
| num_cycles_blocked_by_temp_disk | BIGINT | The count of cycles that the operator spent waiting for input and output from the temporary disk. |
| num_cycles_blocked_by_external_pending_blocks | BIGINT | The count of cycles that the operator spent waiting for input and output from external pending blocks. |
| blobstore_callback_time_ms | DOUBLE | The time, in milliseconds, the system spends processing callbacks for temporary disk input and output for the operator instance. |
| num_bounding_box_lists_sent | BIGINT | The number of geospatial bounding box list filters the operator sent to its peers. |
| num_bounding_box_lists_received | BIGINT | The number of geospatial bounding box list filters the operator received from its peers. |
| target_rows_per_cycle | BIGINT | The number of rows this operator expects to process in a single cycle without exceeding time limits. |
| applied_dynamic_filter_stats | VARCHAR | Additional statistics about dynamic pushdown filters in JSON format. |
| is_runnable | BOOLEAN | Whether the operator has available data to process. |
| current_num_pending_blocks | BIGINT | The current number of pending blocks across all partitions of this operator. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| is_active | BOOLEAN | Whether the operator is currently active or has finalized. |

## sys.completed_operator_instances

This table contains information about operator instances that have finalized in the virtual machine.

| Column Name | Column Type | Column Description |
|---|---|---|
| database_name | VARCHAR | The database associated with the query to which the operator belongs. |
| user_name | VARCHAR | The user associated with the query to which the operator belongs. |
| query_id | UUID | A unique identifier of the query to which the operator belongs. |
| operator_id | UUID | A unique identifier of the finalized operator. |
| node_id | UUID | The unique identifier of the node that stores the information about this operator. |
| silo_id | BIGINT | The unique identifier of the silo that stores the information about this operator. |
| core_id | BIGINT | The unique identifier of the virtual machine core that stores the information about this operator. |
| op_runtime_id | BIGINT | The unique identifier for the operator instance that the system assigns at runtime. |
| op_instance_type | VARCHAR | The name of the type for this operator instance. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| bloom_filtered_rows | BIGINT | The rows filtered by Bloom filters. |
| rows_received | BIGINT | The number of rows fetched by the operator instance. |
| rows_processed | BIGINT | The number of rows processed by this operator instance during execution. |
| rows_emitted | BIGINT | The number of rows returned by the operator instance. |
| blocks_emitted | BIGINT | The number of data blocks returned by the operator instance. |
| finalization_time | TIMESTAMP | The timestamp that represents when the operator completed all work. |
| first_block_receive_time | TIMESTAMP | The timestamp that specifies the receipt of the first data block. |
| first_block_emitted_time | TIMESTAMP | The timestamp that specifies the return of the first data block. |
| num_cycles | BIGINT | The number of cycles that run on this operator instance. |
| num_oom_cycles | BIGINT | The number of run cycles that an operator received for processing out-of-memory issues. |
| num_failed_oom_cycles | BIGINT | The number of out-of-memory cycles received that failed to do any work. |
| num_no_work_oom_cycles | BIGINT | The number of out-of-memory cycles received that reported they had no work to do. |
| run_count | BIGINT | The number of times that the scheduler has reviewed this operator and `isRunnable` is set to `true`. |
| no_work_cycles | BIGINT | The number of times that the read and write cycle |

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| | | executed and performed no work. |
| backed_up_cycles | BIGINT | The number of times a cycle stopped because a backup of the parent exists. |
| leaf_branch_blocked_cycles | BIGINT | The number of times a cycle stopped on a leaf operator because of multi-child scheduling heuristics. |
| num_eof_cycles | BIGINT | The number of end-of-file cycles received. |
| normal_run_time_in_ms | DOUBLE | The time, in milliseconds, of the normal run for the operator instance. |
| dispatch_queue_time_in_ms | DOUBLE | The time spent, in milliseconds, processing incoming message events for the operator instance. |
| oom_run_time_in_ms | DOUBLE | The time, in milliseconds, of the out-of-memory issue for the operator instance. |
| max_hp_mem_usage | BIGINT | The maximum heap memory usage by the operator instance. |
| num_blocks_written | BIGINT | The number of data blocks written to temporary disk. |
| num_blocks_read | BIGINT | The number of data blocks read from temporary disk. |
| num_fragments_written | BIGINT | The number of written memory fragments. |
| num_fragments_read | BIGINT | The number of read memory fragments. |
| cycles_over_1_sec | BIGINT | The count of cycles that ran over 1 second for this operator instance. |
| cycles_over_3_sec | BIGINT | The count of cycles that ran over 3 seconds for this operator instance. |

| | | input and output from external pending blocks. |
| blobstore_callback_time_ms | DOUBLE | The time, in milliseconds, the system spends processing callbacks for temporary disk input and output for the operator instance. |
| num_bounding_box_lists_sent | BIGINT | The number of geospatial bounding box list filters the operator sent to its peers. |
| num_bounding_box_lists_received | BIGINT | The number of geospatial bounding box list filters the operator received from its peers. |
| target_rows_per_cycle | BIGINT | The number of rows this operator expects to process in a single cycle without exceeding time limits. |
| applied_dynamic_filter_stats | VARCHAR | Additional statistics about dynamic pushdown filters in JSON format. |

## sys.completed_queries

This table contains information about queries that finished execution in the database.

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| query_id | UUID | A Universally Unique IDentifier (UUID) of the executed query. |
| user | VARCHAR | The name of the user that executed the query. |
| database_name | VARCHAR | The name of the database that runs this query. |
| database_id | UUID | The unique identifier of the database this query ran in. |
| sql | VARCHAR | The executed SQL statement. |

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| sql_text_length | BIGINT | The length of the SQL statement. |
| referenced_tables | VARCHAR[] | The tables and views referenced by the query. |
| total_time | BIGINT | The total time in milliseconds the query took to run. This time includes generation_time, optimization_time, and execution_time. |
| generation_time | BIGINT | The time in milliseconds it took to generate the query before any processing happened. |
| optimization_time | BIGINT | The time in milliseconds the optimizer processed the query and built an optimized plan for the query. |
| execution_time | BIGINT | Time in milliseconds the query was executed by the database on the LTS nodes to return the query result. |
| timestamp_start | TIMESTAMP | A timestamp that represents the point in time when the query entered the system. |
| parsing_time | BIGINT | The time in milliseconds the query was parsing. |
| cache_lookup_time | BIGINT | The time in milliseconds the query spent in lookup up matching cached result sets. |
| validation_time | BIGINT | The time in milliseconds the query was validating. |
| plangen_time | BIGINT | The time in milliseconds the query plan was being generated. |
| queue_time | BIGINT | The time in milliseconds the query was queued in |

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| | | the system before any processing happened. |
| timestamp_optimization_start | TIMESTAMP | A timestamp that represents the point in time when optimization of the query started. |
| timestamp_execution_start | TIMESTAMP | A timestamp that represents the point in time when execution of the query started. |
| tree_probe_time | BIGINT | The time in milliseconds taken by the VM tree probe during query execution. |
| vm_initialization_time | BIGINT | Time in milliseconds the query was initializing on all participating nodes during execution. |
| timestamp_first_byte_sent | TIMESTAMP | A timestamp that represents the point in time when the first byte of the result set from the query was returned to the application. |
| timestamp_complete | TIMESTAMP | A timestamp that represents the point in time when the execution of the query completed from the client’s perspective. |
| timestamp_execution_complete | TIMESTAMP | A timestamp that represents the point in time when the internal execution of the query completed. |
| awaiting_client_eof_fetch_time | BIGINT | Time in milliseconds that represents the difference between when the client fetched the eof for the query and when the eof was queued internally. |
| rows_returned | BIGINT | The number of rows returned by the query. |
| bytes_returned | BIGINT | The number of bytes returned by the query. |

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| rows_inserted | BIGINT | The number of rows that the query inserts. This value is NULL when the database does not insert any rows. The value is 0 when the database does not identify any rows to insert from a `CREATE TABLE AS SELECT` or `INSERT AS SELECT` SQL statement. |
| rows_deleted | BIGINT | The number of rows that the query deletes. This value is NULL when the database does not delete any rows. The value is 0 when the database does not identify any rows to delete from a `DELETE FROM TABLE` SQL statement. |
| update_subquery_execution_time | BIGINT | The time in milliseconds taken by the virtual machine (VM) to execute a subquery that identifies the rows for insertion or deletion. This value is NULL when you execute a SQL statement that is not one of these statements: `CREATE TABLE AS SELECT`, `INSERT AS SELECT`, or `DELETE FROM TABLE`. |
| transferred_bytes_per_second | BIGINT | The transfer rate in bytes per second for the result set of the query. |
| code | INT | The SQL code returned at the end of the query. |
| state | VARCHAR | The SQL state returned at the end of the query. |
| reason | VARCHAR | A message associated with the SQL code and SQL state. |
| initial_priority | DOUBLE | Priority based on the service class, session, and query-level limits. |

| Column Name | Column Type | Column Description |
|---|---|---|
| initial_effective_priority | DOUBLE | initial_priority adjusted for total cost and memory usage. |
| final_effective_priority | DOUBLE | Final dynamically adjusted priority. |
| cost_estimate | DOUBLE | The cost estimate of the optimizer. |
| concurrency_service_class_name | VARCHAR | Name of the service class this query executes in. |
| concurrency_service_class_id | UUID | The unique identifier of the service class used for the query. |
| priority_adjust_factor | DOUBLE | The percentage amount by which the database adjusts the priority. |
| priority_adjust_time | INT | How frequently the database adjusts the priority during query execution. |
| cached_query | BOOLEAN | Flag that indicates whether the result was returned from the result set cache. |
| resultset_cached | BOOLEAN | Flag that indicates whether the result of the query was stored in the result set cache. |
| temp_disk_consumed | BIGINT | The approximate total temporary disk usage, in bytes, during query execution. |
| protocol_version | VARCHAR | The version of the client-server protocol for this connection. |
| client_ip | VARCHAR | The IP address of the client that executed the query. |
| client_name | VARCHAR | The name of the client that executed the query. |
| client_session_id | VARCHAR | The session id of the client that executed the query. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| num_client_threads | INT | The maximum number of client threads determined by the server. |
| node_id | UUID | The unique identifier of the node that stores the information about this query. |
| participating_nodes | VARCHAR[] | The nodes that participated in the execution of this query. |
| ocient_db_version | VARCHAR | The Ocient® database version used to run this query. |
| ocient_db_commit | VARCHAR | The Ocient database git commit used to run this query. |
| ocient_db_dirtied_commit | VARCHAR | The dirtied Ocient database git commit used to run this query. |
| max_temp_disk_usage | INT | The maximum temporary disk usage for this query, expressed as a percentage. |
| max_elapsed_time | INT | The maximum elapsed time for this query, in seconds. |
| max_rows_returned | BIGINT | The maximum number of rows this query can return. |
| num_root_operator_instances | INT | The number of created root operator instances. |
| approx_system_peak_vm_node_heap_mem_bytes | BIGINT | The max observed heap memory in use during execution on a single non-SQL vm node. The memory in use is not necessarily associated with this query. |
| approx_system_peak_vm_cluster_heap_mem_bytes | BIGINT | The max observed heap memory in use during execution totaled across all non-SQL vm nodes. The memory in use is not necessarily associated with this query. |

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| approx_system_peak_vm_node_huge_mem_bytes | BIGINT | The max observed huge page memory in use during execution on a single non-SQL vm node. The memory in use is not necessarily associated with this query. |
| approx_system_peak_vm_cluster_huge_mem_bytes | BIGINT | The max observed huge page memory in use during execution totaled across all non-SQL vm nodes. The memory in use is not necessarily associated with this query. |
| approx_system_peak_sql_node_heap_mem_bytes | BIGINT | The max observed heap memory in use during execution on the sql node. The memory in use is not necessarily associated with this query. |
| approx_system_peak_sql_node_huge_mem_bytes | BIGINT | The max observed huge page memory in use during execution on the sql node. The memory in use is not necessarily associated with this query. |
| driver_version | VARCHAR | The version of the client driver. |
| join_order_optimization_time | BIGINT | The time, in milliseconds, the join order of the query was optimized. |
| join_order_optimization_algorithm | VARCHAR | The algorithm used for optimizing the join order of the query. |
| tags | VARCHAR[] | The list of tags specified for the query. |
| default_schema | VARCHAR | The default schema associated with the client that executed the query. |
| transaction_id | UUID | The transaction scope UUID for statements executed inside an explicit transaction (with autocommit set to `OFF`). |

| Column Name | Column Type | Column Description |
|---|---|---|
| | | This value is NULL for autocommit statements. |
| transaction_prefix_len | INT | The number of high-order bits of transaction scope UUID that identify the transaction group. This value is NULL for autocommit statements. |
| parent_query_id | UUID | The Universally Unique IDentifier (UUID) of the parent query that spawned this child query. This value is NULL if the query is a top-level query. |

## sys.metric_levels

This table contains settings for metric levels.

| Column Name | Column Type | Column Description |
|---|---|---|
| match | CHAR | Metric name match. |
| match_type | CHAR | The type of match for the name of the metric. |
| level | CHAR | Metric level. |
| node_id | UUID | The unique node identifier for this setting. This setting might be NULL for system-wide metrics. |

## sys.node_status

This table contains the status of nodes in the system and the core node monitoring metrics.

| Column Name | Column Type | Column Description |
|---|---|---|
| node_id | UUID | The Universally Unique IDentifier (UUID) of the node. |
| operational_status | CHAR | The operational status of the node. Values are ACTIVE, STARTING, STOPPING, ERROR, UNKNOWN, or UNREACHABLE. |
| loadavg_1 | DOUBLE | Average load on the node over the last 1 minute. Represents the average number of processes in the |

| Column Name | Column Type | Column Description |
|---|---|---|
| | | system run queue. |
| loadavg_5 | DOUBLE | Average load on the node over the last 5 minutes. Represents the average number of processes in the system run queue. |
| loadavg_15 | DOUBLE | Average load on the node over the last 15 minutes. Represents the average number of processes in the system run queue. |
| max_rss | LONG | Maximum resident set size (RSS) of the process on the node in bytes. |
| heap | LONG | Heap memory allocated on the node in bytes. |
| software_start | TIMESTAMP | Timestamp for the last start of the Ocient software on the node. |
| system_start | TIMESTAMP | Timestamp for the last start of the node hardware. |

## sys.op_inst_debug_info

This table contains information about the debug information for the operator instance.

| Column Name | Column Type | Column Description |
|---|---|---|
| operator_id | UUID | The Universally Unique IDentifier (UUID) of the operator |
| node_id | UUID | The unique identifier of the node that stores the information about this operator. |
| silo_id | LONG | The unique identifier of the silo that stores the information about this operator. |
| vm_core_id | LONG | The unique identifier of the virtual machine core that stores the information about this operator. |
| runtime_id | INT | The process-wide unique identifier of this operator instance. |
| key | CHAR | The debug information (debugInfo) key. |
| value | CHAR | The debugInfo value. |
| op_inst_type | CHAR | Type of the operator Instance. |
| query_id | UUID | The UUID of the query that owns the operator. |

## sys.osn_acquisitions

This table contains information about client identifiers for Ownership Storage Number (OSN) acquisitions.

| Column Name | Column Type | Column Description |
|---|---|---|
| node_id | UUID | The Universally Unique IDentifier (UUID) of the node. |
| client_id | UUID | The query identifier of the OSN acquisition. |
| osn | LONG | The locked OSN. |
| acquisition_time | TIMESTAMP | Timestamp that represents when the OSN was acquired. |

## sys.plans

This table contains information about the plan for each SQL statement. Not all SQL statements have a corresponding plan (e.g., some DDL statements, SQL statements that have failed parsing or optimization).

| Column Name | Column Type | Column Description |
|---|---|---|
| query_id | UUID | The unique identifier of the SQL query that executed. |
| user | VARCHAR | The name of the user that executed the SQL query. |
| database_name | VARCHAR | The name of the database that executes this SQL query. |
| timestamp_start | TIMESTAMP | A timestamp that represents the point in time when the query entered the system. |
| plan | VARCHAR | The plan for the SQL query. |

## sys.queries

This table contains information about queries that the database is currently executing.

| Column Name | Column Type | Column Description |
|---|---|---|
| query_id | UUID | A Universally Unique IDentifier (UUID) of the query that is currently running. |
| user | CHAR | The name of the user that executes the query. |

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| database_name | CHAR | The name of the database that runs this query. |
| database_id | UUID | A unique identifier of the database this query is running in. |
| status | CHAR | The statuses represent how the virtual machine (VM) tracks a specific query. The statuses are: AWAITING_SLOT (The query waits for a service class slot for optimization or execution.), OPTIMIZING (The Ocient System optimizes the query. If the system cannot optimize the query, the query skips this status and changes to the QUEUED status.), QUEUED (The system initializes the query in the VM.), RUNNING (The system executes the query in the VM, either by compiling the result from the Foundation Nodes or by fetching the results from the cache.), and FINALIZING (The query is complete.). |
| sql | CHAR | The SQL statement that is executing. |
| sql_text_length | LONG | The length of the SQL statement. |
| referenced_tables | ARRAY(CHAR) | The tables and views referenced by the query. |
| total_time | LONG | The total time in milliseconds the query has run. This time includes generation_time, optimization_time, and execution_time. |
| generation_time | LONG | The time in milliseconds the query was generated or is still generating. This |

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| | | number might increase if generation is in progress. |
| optimization_time | LONG | The time in milliseconds the optimizer processed or is still processing the query. This number might be 0 if optimization of the query has not started yet. This number might increase if optimization is in progress. |
| execution_time | LONG | Time in milliseconds the query executes. This number might be 0 if execution of the query has not started yet. This number might increase if execution of the query is still in progress. |
| timestamp_start | TIMESTAMP | A timestamp that represents the point in time when the query entered the system. |
| parsing_time | LONG | Time in milliseconds the query was parsing or is still parsing. This number might be 0 if parsing of the query has not started yet. This number might increase if the query is still parsing. |
| cache_lookup_time | LONG | The time in milliseconds the query spent in lookup up matching cached result sets. |
| validation_time | LONG | Time in milliseconds the query was validating or is still being validated. This number might be 0 if validation of the query has not started yet. This number might increase if the query is still validating. |
| plangen_time | LONG | Time in milliseconds the query plan was being generated or is still generating. This number |

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| | | might be 0 if generation of the query plan has not started yet. This number might increase if the query plan is still generating. |
| queue_time | LONG | Time in milliseconds the query was queued or is still queuing. This number might be 0 if queuing of the query has not started yet. This number might increase if the query is still in the queue. |
| timestamp_optimization_start | TIMESTAMP | A timestamp that represents the point in time when optimization of the query started. This value might be 0 if optimization has not started yet. |
| timestamp_execution_start | TIMESTAMP | A timestamp that represents the point in time when execution of the query started. This value might be 0 if execution has not started yet. |
| tree_probe_time | LONG | Time in milliseconds the query was in the VM tree probe stage during execution. This number might be 0 if VM tree probe has not started yet. This number might increase if the probe is still happening. |
| vm_initialization_time | LONG | Time in milliseconds the query was initializing on all participating nodes during execution. This number might be 0 if the VM has not begin initializing the query for execution yet. |
| timestamp_first_byte_sent | TIMESTAMP | A timestamp that represents the point in time when the first byte of the result set from the query was returned to the application. This value |

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| | | might be 0 if execution of the query has not started yet or no bytes have been transferred yet. |
| rows_returned | LONG | The number of rows returned by the query. This value might be 0 if no rows have been transferred so far. |
| bytes_returned | LONG | The number of bytes returned by the query. This value might be 0 if no rows have been transferred so far. |
| rows_inserted | LONG | The number of rows that the query inserts. This value is NULL when the database does not insert any rows. The value is 0 when the database does not identify any rows to insert from a `CREATE TABLE AS SELECT` or `INSERT AS SELECT` SQL statement. |
| rows_deleted | LONG | The number of rows that the query deletes. This value is NULL when the database does not delete any rows. The value is 0 when the database does not identify any rows to delete from a `DELETE FROM TABLE` SQL statement. |
| update_subquery_execution_time | LONG | The time in milliseconds taken by the VM to execute a subquery that identifies the rows for insertion and deletion. This value is NULL when you execute a SQL statement that is not one of these statements: `CREATE TABLE AS SELECT`, `INSERT AS SELECT`, or `DELETE FROM TABLE`. |
| initial_priority | DOUBLE | Priority based on the service class, session, and |

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| | | query level limits. |
| initial_effective_priority | DOUBLE | initial_priority adjusted for total cost and memory usage. |
| effective_priority | DOUBLE | Current dynamically adjusted priority. |
| estimated_time | INT | The estimate of the optimizer for the time in milliseconds to process the query. |
| estimated_result_rows | LONG | The estimate of the optimizer for the number of rows in the result set. |
| estimated_result_size | LONG | The estimate of the optimizer for the size of the result set in bytes. |
| concurrency_service_class_name | CHAR | Name of the service class this query executes in. |
| concurrency_service_class_id | UUID | The unique identifier of the service class used for the query. |
| priority_adjust_factor | DOUBLE | The percentage amount by which the database adjusts the priority. |
| priority_adjust_time | INT | How frequently the database adjusts the priority during query execution. |
| cached_query | BOOLEAN | Flag that indicates whether the result is returned from the result set cache. |
| temp_disk_consumed | LONG | The approximate total temporary disk usage, in bytes, during query execution. |
| server_ip | IPV4 | The IP address of the SQL node that executed the query. |
| protocol_version | CHAR | The version of the client-server protocol for this |

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| | | connection. |
| driver_version | CHAR | The version of the client driver. |
| client_ip | CHAR | The IP address of the client that executed the query. |
| client_name | CHAR | The name of the client that executed the query. |
| client_session_id | CHAR | The session id of the client that executed the query. |
| num_client_threads | INT | The maximum number of client threads determined by the server. |
| node_id | UUID | The unique identifier of the node that provided the information about this query. |
| participating_nodes | ARRAY(CHAR) | The nodes that are currently known to be participating in the execution of this query. If the query is not in the RUNNING state, this list might not include all nodes that participate. |
| max_temp_disk_usage | INT | The maximum temporary disk usage for this query, expressed as a percentage. |
| max_elapsed_time | INT | The maximum elapsed time for this query, in seconds. |
| max_rows_returned | LONG | The maximum number of rows this query can return. |
| num_root_operator_instances | INT | The number of created root operator instances. |
| approx_system_peak_vm_node_heap_mem_bytes | LONG | The max observed heap memory in use during execution on a single non-SQL vm node. The memory in use is not necessarily associated with this query. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| approx_system_peak_vm_cluster_heap_mem_bytes | LONG | The max observed heap memory in use during execution totaled across all non-SQL vm nodes. The memory in use is not necessarily associated with this query. |
| approx_system_peak_vm_node_huge_mem_bytes | LONG | The max observed huge page memory in use during execution on a single non-SQL vm node. The memory in use is not necessarily associated with this query. |
| approx_system_peak_vm_cluster_huge_mem_bytes | LONG | The max observed huge page memory in use during execution totaled across all non-SQL vm nodes. The memory in use is not necessarily associated with this query. |
| approx_system_peak_sql_node_heap_mem_bytes | LONG | The max observed heap memory in use during execution on the sql node. The memory in use is not necessarily associated with this query. |
| approx_system_peak_sql_node_huge_mem_bytes | LONG | The max observed huge page memory in use during execution on the sql node. The memory in use is not necessarily associated with this query. |
| join_order_optimization_time | LONG | The time, in milliseconds, the join order of the query was optimized. |
| join_order_optimization_algorithm | CHAR | The algorithm used for optimizing the join order of the query. |
| tags | ARRAY(CHAR) | The list of tags specified for the query. |
| default_schema | CHAR | The default schema associated with the client that executed the query. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| transaction_id | UUID | The UUID of the transaction where this statement executes. This value is NULL when the statement is not part of an explicit transaction. For `COMMIT` and `ROLLBACK` SQL statements, the value is the scope for the commit or rollback. |
| transaction_prefix_len | INT | The transaction scope prefix length. This value is NULL when the statement is not part of an explicit transaction. |
| timestamp_last_fetch | TIMESTAMP | A timestamp that represents the point in time when the application most recently fetched result data for this query. This value might be 0 if the application has not fetched any result data yet. |
| max_fetch_gap | LONG | The longest observed gap, in milliseconds, between consecutive result-data fetches by the application. This gap includes the still-open gap after the most recent fetch, so a large value indicates an application that has stopped consuming results. |
| parent_query_id | UUID | The Universally Unique IDentifier (UUID) of the parent query that spawned this child query. This value is NULL if the query is a top-level query. |

## sys.result_cache

This table contains queries that have cached results in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| node_id | UUID | The Universally Unique IDentifier (UUID) of the node that holds the cache results. |
| query_id | UUID | The UUID of the query. |
| database_id | UUID | The database of the query. |
| service_class_id | UUID | The UUID of the service class of the query. |
| timestamp | LONG | The timestamp in seconds after the UNIX epoch when the result set entered the cache. |
| time | CHAR | The human-readable time when the result set entered the cache. |
| time_remaining | LONG | The amount of time remaining, in seconds, before the system purges the cached result set. This value is NULL if no finite system-level purge timeout applies, which is the case when at least one service class has defined an unlimited `cache_max_time` value. |
| referenced_tables | ARRAY(CHAR) | All referenced tables in this query. |

## sys.retention_policies

The `retention_policies` table shows the tables that have a retention policy enabled in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| table_id | UUID | The Universally Unique IDentifier (UUID) of the table. |
| retention_interval | VARCHAR | The retention interval for the retention policy. |
| execution_interval | VARCHAR | The execution interval for the retention policy. |

## sys.sample_segment_io_pipelines

This table contains information about a sample of segment I/O processing plans used for the database table I/O during query execution.

| Column Name | Column Type | Column Description |
|---|---|---|
| completed_time | TIMESTAMP | The time when this segment pipeline was completed. |

| Column Name | Column Type | Column Description |
|---|---|---|
| database_name | VARCHAR | The database associated with the query to which the I/O operator belongs. |
| user_name | VARCHAR | The name of the user associated with the query to which the I/O operator belongs. |
| query_id | UUID | The Universally Unique IDentifier (UUID) of the query to which the I/O operator belongs. |
| operator_uuid | UUID | The UUID of the I/O operator in the query plan. |
| operator_id | BIGINT | An identifier of the I/O operator in the VM node that owns it. |
| node_id | UUID | The UUID of the node on which the I/O operator was executed. |
| silo_id | BIGINT | The identifier of the silo on which this I/O operator was executed. |
| segment_storage_id | UUID | The UUID for the segment associated with this I/O pipeline. |
| table_id | UUID | The UUID for the database table where this segment belongs. |
| segment_bounds_lower_inclusive | BIGINT | The lower bound (inclusive) on the row numbers processed in this pipeline. |
| segment_bounds_upper_exclusive | BIGINT | The upper bound (exclusive) on the row numbers processed in this pipeline. |
| pipeline | VARCHAR | A text representation of this segment I/O pipeline. |

## sys.scheduled_tasks

This table contains the details of scheduled tasks in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | The scheduled task identifier. |
| admin_owner_id | UUID | The identifier of the node that is managing the scheduled task. |
| task_type | CHAR | The type of the task. |
| execution_interval_ms | LONG | The interval, in milliseconds, between task executions. |

## sys.schemas

This table contains the details of schemas in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | The Universally Unique IDentifier (UUID) of the schema. |
| name | CHAR | The name of the schema. |
| database_id | UUID | The UUID of the database for the schema. |
| created_at | TIMESTAMP | The timestamp that represents when the schema was created. |
| updated_at | TIMESTAMP | The timestamp that represents when the schema was updated. |
| creator_id | UUID | The UUID of the creator for the schema. |
| is_implicit | BOOLEAN | Denotes the implicit creation of this schema after the creation of another object. |

## sys.service_role_status

This table contains the status of each service role on the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| node_id | UUID | The Universally Unique IDentifier (UUID) of the node. |
| service_role_id | UUID | The UUID of the service role (sys.service_roles). |
| service_role_name | CHAR | The human-readable name of the service role on the node. |
| status | CHAR | The current status of the role on this node. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

## sys.storage_device_metrics

This table contains monitoring metrics collected on each storage device that is controlled by Ocient.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | CHAR | Unique and persistent serial number of the drive. This serial number is not a Universally Unique IDentifier (UUID). |
| key | CHAR | Name of the measured statistic on the drive. |
| value | CHAR | Value of the named statistic on the drive. |
| transient | BOOLEAN | When the value is true, the value indicates that it is transient in nature and is reset when the node is restarted. |
| node_id | UUID | The UUID of the node that contains the storage device. |
| cluster_id | UUID | The UUID of the storage cluster (sys.clusters) where the node of the device belongs. This value is NULL if the node is not a member of a storage cluster. |

## sys.storage_device_status

This table contains real-time information about the storage devices for each online node.

| Column Name | Column Type | Column Description |
|---|---|---|
| node_id | UUID | The Universally Unique IDentifier (UUID) of the node that contains the storage device. |
| device_id | INT | Identifier of the drive. |
| role_name | CHAR | The name of the role or roles active on the node that contains the storage device. |
| id | CHAR | Unique and persistent serial number of the drive. This serial number is not a UUID. |
| pci_address | CHAR | PCI address where the drive is mounted. |
| device_model | CHAR | Model information about the drive. |
| manufacturer | CHAR | Manufacturer information about the drive. |
| firmware_version | CHAR | Firmware version that is active on the drive. |
| capacity | LONG | Capacity, in bytes, of the drive. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| utilization | LONG | Utilization, in bytes, of the drive. |
| endurance_percentage_used | DOUBLE | Value from 0 to 1 that represents an estimate of the percentage of the drive used, as it applies to drive endurance. |
| device_status | CHAR | Human-readable version of the drive status. Values are `ACTIVE`, `FAILED`, or `NOT PRESENT`. |
| assigned_drive_slots | ARRAY(INT) | List of drive slots assigned to this device. The list might be empty if no slots are assigned to a device. |
| encryption_drive_locking_supported | BOOLEAN | Indicates whether encryption drive locking (e.g., OPAL) is supported on the device. |
| encryption_drive_locking_enabled | BOOLEAN | Indicates whether encryption drive locking (e.g., OPAL) is enabled on the device. |
| encryption_drive_locking_status | CHAR | Indicates the status of drive locking (e.g., OPAL): `LOCKED` or `UNLOCKED`. If drive locking is not supported, this value is `UNLOCKED`. |
| silo_id | LONG | The identifier of the silo where this device is located. |
| cluster_id | UUID | The UUID of the storage cluster (sys.clusters) where the node of the device belongs. This value is NULL if the node is not a member of a storage cluster. |

## sys.subtasks

This table contains the status and details of subtasks in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | The task identifier. |
| name | CHAR | The name of the task. |
| task_type | CHAR | The type of the task. |
| execution_type | CHAR | The type of the task execution. |
| location_type | CHAR | The type of the location where the task must run. |
| location_id | CHAR | The location where the task must run. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| task_options | CHAR | The task arguments. |
| start_time | TIMESTAMP | The start time of the task. |
| end_time | TIMESTAMP | The end time of the task. |
| last_poll_time | TIMESTAMP | The last time that the task was polled for a status. |
| duration | LONG | The duration, in milliseconds, of the task. |
| status | CHAR | The current status of the task. |
| details | CHAR | The details or results of the status for the current task. |
| task_owner_id | UUID | The identifier of the node that is running the task. |
| admin_owner_id | UUID | The identifier of the node that is monitoring the task. |
| parent_task_id | UUID | The identifier of the parent task for the current task. |
| root_task_id | UUID | The identifier of the root task for the current task. |
| database_id | UUID | The database identifier. |
| parallelization | CHAR | The parallelization type of the task. |
| state | BINARY | The internal state of the task. |
| scope | UUID | The identifier of the scope for the current task. |

## sys.tasks

The `tasks` table shows the root tasks that have been started in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | Task identifier |
| name | VARCHAR | Task name |
| task_type | VARCHAR | Task type |
| execution_type | VARCHAR | Task execution type |
| location_type | VARCHAR | Location type where the task must run |
| location_id | VARCHAR | Location where the task must run |
| task_options | VARCHAR | Task arguments |
| start_time | TIMESTAMP | Task start time |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| end_time | TIMESTAMP | Task end time |
| last_poll_time | TIMESTAMP | Last time the task was polled for status |
| duration | BIGINT | Task duration in milliseconds |
| status | VARCHAR | Current task status |
| details | VARCHAR | Current task status details or results |
| task_owner_id | UUID | Identifier of the node that is running the task |
| admin_owner_id | UUID | Identifier of the node that is monitoring the task |
| parallelization | VARCHAR | Parallelization type of the task |
| scope | UUID | Identifier of the scope of the task |

# Network

## sys.channel_endpoint_parameters

This table contains details for the endpoints defined on the nodes in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | Universally Unique IDentifier (UUID) of the channel endpoint. |
| node_id | UUID | UUID of the node where the endpoint is located (sys.nodes). |
| name | CHAR | Name of the channel endpoint. |
| endpoint_type | CHAR | Type of the channel endpoint (FULL or EXTERNAL). |
| port | INT | Port that the channel endpoint is using. |
| ip_address | CHAR | IP address of the channel endpoint. |
| context_type | CHAR | Context type of the channel endpoint |
| listener_type | CHAR | Listener type of the channel endpoint |
| initiator_type | CHAR | Initiator type of the channel endpoint. |

## sys.network_interface_models

This table contains the network devices registered on the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | Universally Unique IDentifier (UUID) of the NIC. |
| manufacturer | CHAR | Manufacturer of the NIC. |
| model_name | CHAR | Model name of the NIC. |
| pci_id | CHAR | PCI identifier. |
| pci_subsys_id | CHAR | PCI Subsystem identifier. |
| driver_type | CHAR | Driver type of NIC. |
| bits_per_second | LONG | Bits per second. |

## sys.network_interface_usage_types

This table contains the uses of each network device in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| network_interface_id | UUID | Universally Unique IDentifier (UUID) of the network interface (sys.network_interfaces). |
| network_interface_model_id | UUID | UUID of the network interface model (sys.network_interface_models). |
| network_type | CHAR | Usage type of NIC (ADMIN, DATA, EXTERNAL, LOCAL_HSI). |

## sys.node_network_interfaces

This table contains the network interfaces on each node.

| Column Name | Column Type | Column Description |
|---|---|---|
| network_interface_model_id | UUID | Universally Unique IDentifier (UUID) of the network interface model (sys.network_interface_models). |
| network_interface_id | UUID | UUID of the network interface. |
| node_id | UUID | UUID of the node where this interface exists (sys.nodes). |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| interface_type | CHAR | Type of interface (PHYSICAL, BOND_SLAVE, BOND_MASTER). |
| address | CHAR | MAC address of the NIC. |
| name | CHAR | Name of the NIC. |
| netmask | CHAR | Netmask of the NIC. |
| gateway | CHAR | Gateway of the NIC. |
| pci_address | CHAR | PCI address of the NIC. |
| master_interface_name | CHAR | Master interface name of the NIC. |
| bond_type | CHAR | Network bond type of the NIC. |

### sys.service_role_channel_endpoints

This table contains the channel endpoint parameters that are enabled for each network type and service role.

| Column Name | Column Type | Column Description |
|---|---|---|
| service_role_id | UUID | The Universally Unique IDentifier (UUID) of the service role of this endpoint (sys.service_roles). |
| channel_endpoint_parameters_id | UUID | UUID of the parameters for this endpoint (sys.channel_endpoint_parameters). |
| network_type | CHAR | Network type for this endpoint (ADMIN, DATA, EXTERNAL, LOCAL_HSI). |

## Pipelines

### sys.pipeline_current_throughput

This table contains the current throughput of rows and bytes ingested (MB) by the data pipeline.

| Column Name | Column Type | Column Description |
|---|---|---|
| pipeline_id | UUID | Universally Unique IDentifier (UUID) of the pipeline (sys.pipelines) loading this |

| Column Name | Column Type | Column Description |
|---|---|---|
| | | partition. |
| records_throughput_per_second | DOUBLE | The throughput of the data pipeline measured as the current records loaded per second. |
| megabytes_throughput_per_second | DOUBLE | The throughput of the data pipeline measured as the current megabytes loaded per second. |

## sys.pipeline_errors

While running a pipeline, you might experience errors. These errors are often due to a mismatch between the expectation of the pipeline and the source data. System or networking errors can also occur while the pipeline is running. The sys.pipeline_errors system catalog table lists extraction, transformation, and pipeline errors.

| Column Name | Column Type | Column Description |
|---|---|---|
| pipeline_id | UUID | Universally Unique IDentifier (UUID) of the pipeline (sys.pipelines) that loads this partition. |
| extractor_task_id | UUID | UUID of the task associated with this pipeline run (sys.subtasks). |
| error_index | BIGINT | Error indexes start at 1 and increase monotonically as the Ocient System finds them. |
| error_type | VARCHAR | The type of error. Values are EXTRACTION, TRANSFORMATION, and PIPELINE_ERROR. |
| error_code | VARCHAR | This 5-character code identifies the type of error. |
| source_name | VARCHAR | For file loads, this value is the absolute path of the file that includes the S3 bucket. For Apache® Kafka® loads, the value is the topic name and partition number. |
| error_message | VARCHAR | The error message. |
| partition_id | VARCHAR | The identifier of the partition. For file loads, the value is the stream source identifier where the file is located. For Apache Kafka loads, this value is the partition number. |
| record_number | BIGINT | The one-based index of the processed record in the source file or Kafka partition defined in the `source_name` column. This index does not account for headers or skipped lines. |
| record_offset | BIGINT | The one-based offset in bytes of the record data in the source file for file loads or the Kafka offset for Kafka loads. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| | | This offset is -1 for files with non-row-based storage formats (such as Apache® Parquet™). |
| field_index | INT | The zero-based index of the expression in the `SELECT` clause of the `CREATE PIPELINE` SQL statement. |
| column_name | VARCHAR | The name of the column in the target table. |
| created_at | TIMESTAMP | Timestamp that represents when this error was created. |

## sys.pipeline_errors_historical

This view shows pipeline errors for pipelines that have been dropped from the system. The view is the historical equivalent of sys.pipeline_errors.

| Column Name | Column Type | Column Description |
|---|---|---|
| pipeline_id | UUID | Universally Unique IDentifier (UUID) of the pipeline that loads this partition. |
| extractor_task_id | UUID | UUID of the task associated with this pipeline run (sys.subtasks). |
| error_index | BIGINT | Error indexes start at 1 and increase monotonically as the Ocient System finds them. |
| error_type | VARCHAR | The type of error. Values are `EXTRACTION` (extraction), `TRANSFORMATION` (transformation), and `PIPELINE_ERROR` (pipeline error). |
| error_code | VARCHAR | This 5-character code identifies the type of error. |
| source_name | VARCHAR | For file loads, this value is the absolute path of the file that includes the Amazon® Web Services℠ (AWS℠) S3 bucket. For Kafka loads, the value is the topic name and partition number. |
| error_message | VARCHAR | The error message. |
| partition_id | VARCHAR | The identifier of the partition. For file loads, the value is the stream source identifier where the file is located. For Kafka loads, this value is the partition number. |
| record_number | BIGINT | The index of the processed record in the source file or Kafka partition defined in the `source_name` column. This index starts at 1. The index does not account for headers or skipped lines. |
| record_offset | BIGINT | The offset, in bytes, of the record data in the source file for file loads or the Kafka offset for Kafka loads. The offset |

| Column Name | Column Type | Column Description |
|---|---|---|
| | | starts at 1. This offset is -1 for files with non-row-based storage formats (such as Apache Parquet). |
| field_index | INT | The index of the expression in the `SELECT` clause of the `CREATE PIPELINE` SQL statement. This index starts at 0. |
| column_name | VARCHAR | The name of the column in the target table. |
| created_at | TIMESTAMP | Timestamp that represents when this error was created. |

## sys.pipeline_events

While your pipeline is running, the pipeline generates events in the sys.pipeline_events system catalog table to mark significant checkpoints when something has occurred. For details about the lists of files, see the sys.pipeline_files system catalog table. Pipeline events include messages from many different tasks. These events are the background processes that execute across different Loader Nodes during pipeline operation. For details about tasks, you can query the sys.tasks and sys.subtasks system catalog tables.

| Column Name | Column Type | Column Description |
|---|---|---|
| pipeline_id | UUID | Universally Unique IDentifier (UUID) of the pipeline (sys.pipelines). |
| task_id | UUID | UUID of the task associated with this pipeline run (sys.subtasks). |
| user_id | UUID | The user who initiated the event (sys.users). |
| event_type | VARCHAR | The type of the event. You can generate events with these types: CREATED, REPLACED, RENAMED, STARTED, STOPPING, STOPPED, QUIESCING, and QUIESCED. The Ocient System generates events with these types automatically: FILE_LISTING_STARTED, FILE_LISTING_GENERATED, FILE_LISTING_COMPLETED, COMPLETED, FAILED, EXTRACTION_STARTED, EXTRACTION_COMPLETED, EXTRACTION_FAILED, EXTRACTION_RESOURCE_EXHAUSTED, SKIPPING_PARTIALLY_LOADED_FILE, and KAFKA_PARTITION_REBALANCE. |
| event_message | VARCHAR | Message that provides more details about the event. |
| event_timestamp | TIMESTAMP | Timestamp that represents when this event occurred. |

## sys.pipeline_events_historical

This view shows pipeline events for pipelines that have been dropped from the system. The view is the historical equivalent of sys.pipeline_events.

| Column Name | Column Type | Column Description |
|---|---|---|
| pipeline_id | UUID | Universally Unique IDentifier (UUID) of the pipeline. |
| task_id | UUID | UUID of the task associated with this pipeline run (sys.subtasks). |
| user_id | UUID | The user who initiated the event (sys.users). |
| event_type | VARCHAR | The type of the event. You can generate events with these types: CREATED, REPLACED, RENAMED, STARTED, STOPPING, and STOPPED. The Ocient System generates events with these types automatically: FILE_LISTING_STARTED, FILE_LISTING_GENERATED, FILE_LISTING_COMPLETED, COMPLETED, FAILED, EXTRACTION_STARTED, EXTRACTION_COMPLETED, EXTRACTION_FAILED, EXTRACTION_RESOURCE_EXHAUSTED, SKIPPING_PARTIALLY_LOADED_FILE, and KAFKA_PARTITION_REBALANCE. |
| event_message | VARCHAR | Message that provides more details about the event. |
| event_timestamp | TIMESTAMP | Timestamp that represents when this event occurred. |

## sys.pipeline_files

For file-based loads, the sys.pipeline_files system catalog table contains one row for each file that shows the status of the file.

| Column Name | Column Type | Column Description |
|---|---|---|
| pipeline_id | UUID | Universally Unique IDentifier (UUID) of the pipeline (sys.pipelines). |
| extractor_task_id | UUID | The unique identifier of the task requested to load this file (sys.subtasks). |
| name | VARCHAR | Name of the file. |
| create_timestamp | TIMESTAMP | Timestamp that represents when this file is created. |
| modified_timestamp | TIMESTAMP | Timestamp that represents when this file is last modified. |
| size | BIGINT | Size of the file. |

| Column Name | Column Type | Column Description |
|---|---|---|
| status | VARCHAR | The status of the file that updates throughout the process of a pipeline load. Values are: PENDING (listed file but not assigned to an extractor task), QUEUED (assigned to an extractor task but not confirmed the existence of the file), LOADING (confirmed existence of the file and began loading), LOADED (loaded data with complete success), LOADED_WITH_ERRORS (loaded data with at least one error), FAILED (failed to load), and SKIPPED (skipped loading the file). |
| file_index | BIGINT | Index of the file. |

## sys.pipeline_files_historical

This view shows pipeline files (terminal and pending) for pipelines that have been dropped from the system. The view is the historical equivalent of sys.pipeline_files.

| Column Name | Column Type | Column Description |
|---|---|---|
| pipeline_id | UUID | Universally Unique IDentifier (UUID) of the pipeline. |
| extractor_task_id | UUID | The UUID of the task requested to load this file (sys.subtasks). |
| name | VARCHAR | Name of the file. |
| create_timestamp | TIMESTAMP | Timestamp that represents when this file is created. |
| modified_timestamp | TIMESTAMP | Timestamp that represents when this file is last modified. |
| size | BIGINT | Size of the file. |
| status | VARCHAR | The status of the file that updates throughout the process of a pipeline load. Values are: PENDING (system listed the file but has not assigned it to an extractor task), QUEUED (system has assigned to an extractor task but has not confirmed the existence of the file), LOADING (system has confirmed the existence of the file and began loading), LOADED (system has loaded data with complete success), LOADED_WITH_ERRORS (system has loaded data with at least one error), FAILED (system has failed to load), and SKIPPED (system has skipped loading the file). |
| file_index | BIGINT | Index of the file. |

## sys.pipeline_files_pending

For file-based loads, the sys.pipeline_files system catalog table contains one row for each file that shows the status of the file.

| Column Name | Column Type | Column Description |
|---|---|---|
| pipeline_id | UUID | Universally Unique IDentifier (UUID) of the pipeline (sys.pipelines). |
| name | VARCHAR | The name of the file. |
| create_timestamp | TIMESTAMP | The timestamp that represents when this file is created. |
| modified_timestamp | TIMESTAMP | The timestamp that represents when this file is last modified. |
| size | BIGINT | The size of the file. |
| file_index | BIGINT | The index of the file. |
| file_transaction_id | BIGINT | The identifier of the file transaction that produced this file. |

## sys.pipeline_functions

This table contains all of the pipeline functions in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | The Universally Unique IDentifier (UUID) of the pipeline function. |
| name | CHAR | The name of the pipeline function. |
| database_id | UUID | The UUID of the database for this pipeline function (sys.databases). |
| language | CHAR | The language used to write the pipeline function. |
| return_type | CHAR | The return type of the pipeline function. |
| return_type_nullable | BOOLEAN | The nullable property of the return type for the pipeline function. |
| definition | CHAR | The definition of the pipeline function. |
| creator_id | UUID | The UUID of the user or group who created the pipeline function (sys.users/sys.groups). |
| created_at | TIMESTAMP | The timestamp when this pipeline function was created. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| altered_at | TIMESTAMP | The timestamp when this pipeline function was last updated. |
| argument_names | ARRAY(CHAR) | The argument names of the pipeline function, specified as an array. |
| argument_types | ARRAY(CHAR) | The argument types of the pipeline function, specified as an array. |
| argument_nullability | ARRAY(BOOLEAN) | Whether the argument types for the pipeline function are nullable, specified as an array. |
| imported_libraries | ARRAY(CHAR) | The import statements for the pipeline function, specified as an array. |

## sys.pipeline_metrics

Find metrics that measure the performance and activity of a pipeline in the sys.pipeline_metrics view. This table contains one row for each metric at a specified point in time. Metrics are either instantaneous or incremental. Instantaneous metrics reflect the current value of a counter at the time of the metric collection. Incremental metrics increase over time and reflect the cumulative value for a specified counter. The first snapshot of a metric appears when it is initialized. Afterward, the system updates the metric every 10 seconds. Each metric has a scope that defines its uniqueness. Do not aggregate metrics across different scopes. The scope columns are pipeline_id, extractor_task_id, partition_id, sink_index, file_index, work_unit_id, work_unit_attempt, and epoch_id. If the value of any of these columns is NULL, the scope applies to all values in that dimension.

| Column Name | Column Type | Column Description |
|---|---|---|
| pipeline_id | UUID | UUID of the pipeline (sys.pipelines) loading this partition. |
| extractor_task_id | UUID | UUID of the task associated with this pipeline run (sys.subtasks). |
| partition_id | VARCHAR | The partition identifier. For file-based loads, this identifier is the stream source identifier. For Kafka loads, this identifier is the partition number. |
| sink_index | BIGINT | The one-based index of the table in the `CREATE PIPELINE` SQL statement or NULL for metrics that are not table-specific. |
| name | VARCHAR | The name of the metric. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| value | BIGINT | The value of the metric. |
| updated_at | TIMESTAMP | Timestamp that represents when this metric was updated. |
| file_index | BIGINT | Index of the file. |
| work_unit_id | BIGINT | The work unit identifier of the unit of work dispatched to the extractor engine. |
| work_unit_attempt | BIGINT | The work unit attempt of the unit of work dispatched to the extractor engine. |
| epoch_id | BIGINT | The epoch identifier that represents when this metric was collected. |

## sys.pipeline_metrics_current

This table contains the most updated metrics for the data pipeline that measure the performance and activity of a pipeline in the sys.pipeline_metrics view. The scope columns are pipeline_id, extractor_task_id, partition_id, sink_index, file_index, work_unit_id, work_unit_attempt, and epoch_id. If the value of any of these columns is NULL, the scope applies to all values in that dimension.

| Column Name | Column Type | Column Description |
|---|---|---|
| pipeline_id | UUID | Universally Unique IDentifier (UUID) of the pipeline (sys.pipelines) loading this partition. |
| extractor_task_id | UUID | UUID of the task associated with this pipeline run (sys.subtasks). |
| partition_id | VARCHAR | The partition identifier. For file-based loads, this identifier is the stream source identifier. For Apache Kafka loads, this identifier is the partition number. |
| sink_index | BIGINT | The one-based index of the table in the `CREATE PIPELINE` SQL statement or NULL for metrics that are not table-specific. |
| name | VARCHAR | The name of the metric. |
| value | BIGINT | The value of the metric. |
| updated_at | TIMESTAMP | The timestamp that represents when this metric was updated. |
| file_index | BIGINT | The index of the file. |

| Column Name | Column Type | Column Description |
|---|---|---|
| work_unit_id | BIGINT | The work unit identifier of the unit of work dispatched to the extractor engine. |
| work_unit_attempt | BIGINT | The work unit attempt of the unit of work dispatched to the extractor engine. |
| epoch_id | BIGINT | The epoch identifier that represents when this metric was collected. |

## sys.pipeline_metrics_historical

This view shows pipeline metrics for pipelines that have been dropped from the system. The view is the historical equivalent of sys.pipeline_metrics.

| Column Name | Column Type | Column Description |
|---|---|---|
| pipeline_id | UUID | Universally Unique IDentifier (UUID) of the pipeline loading this partition. |
| extractor_task_id | UUID | UUID of the task associated with this pipeline run (sys.subtasks). |
| partition_id | VARCHAR | The partition identifier. For file-based loads, this identifier is the stream source identifier. For Kafka loads, this identifier is the partition number. |
| sink_index | BIGINT | The index of the table in the `CREATE PIPELINE` SQL statement or NULL for metrics that are not table-specific. This index starts at 1. |
| name | VARCHAR | The name of the metric. |
| value | BIGINT | The value of the metric. |
| updated_at | TIMESTAMP | Timestamp that represents when this metric was updated. |
| file_index | BIGINT | Index of the file. |
| work_unit_id | BIGINT | The work unit identifier of the unit of work dispatched to the extractor engine. |
| work_unit_attempt | BIGINT | The work unit attempt of the unit of work dispatched to the extractor engine. |
| epoch_id | BIGINT | The epoch identifier that represents when this metric was collected. |

## sys.pipeline_metrics_info

Find the full list of available metrics in the sys.pipeline_metrics_info built-in view. This static table provides metric units, type, and descriptions.

| Column Name | Column Type | Column Description |
|---|---|---|
| name | VARCHAR | Name of the metric. |
| units | VARCHAR | Units of the metric. |
| metric_type | VARCHAR | Type of the metric. One of INCREMENTAL or INSTANTANEOUS. |
| description | VARCHAR | Description of the metric. |

## sys.pipeline_partitions

For Apache Kafka partition-based loads, the sys.pipeline_partitions system catalog table contains one row for each partition, which contains the current offsets and record counts.

| Column Name | Column Type | Column Description |
|---|---|---|
| pipeline_id | UUID | Universally Unique IDentifier (UUID) of the pipeline (sys.pipelines) loading this partition. |
| partition_number | BIGINT | The partition number on the Kafka topic. |
| group_id | VARCHAR | The group identifier (group.id) of the pipeline that loads this partition. |
| topic_name | VARCHAR | The name of the Kafka topic where this partition belongs. |
| max_offset | BIGINT | The current maximum offset on this partition. |
| last_committed_durable_offset | BIGINT | The last committed offset on the partition that was indicated as durable by the Ocient System. This offset might lag slightly behind the actual durability of tables. |
| lag | BIGINT | The number of records yet to be processed in a partition, calculated as the difference between the maximum offset and the last committed durable offset. |
| records_processed | INT | The number of records processed (but not necessarily made durable) for this partition. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| records_failed | BIGINT | The number of failed records for this partition. |
| updated_at | TIMESTAMP | The timestamp when the Ocient System last updated the details of this partition. |

## sys.pipeline_tables

This table contains all of the table identifiers currently associated with pipeline objects in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| pipeline_id | UUID | Universally Unique IDentifier (UUID) of the pipeline (sys.pipelines). |
| table_id | UUID | UUID of the table (sys.tables). |
| table_index | INT | The one-based index of the table in the `CREATE PIPELINE` SQL statement. |

## sys.pipeline_tasks

The Ocient System implements the internals of a pipeline using distributed tasks. Each pipeline has a unique pipeline identifier pipeline_id. Every time that a START PIPELINE SQL statement is executed, the Ocient System generates a run_pipeline task that serves as the main coordinator task. This task automatically partitions the source data into smaller units and creates a run_extractor task for each one. Then, the Ocient System sends each run_extractor task and executes it on a Loader Node. In the sys.pipeline_tasks system catalog table, you can see the run_pipeline and run_extractor tasks.

| Column Name | Column Type | Column Description |
|---|---|---|
| pipeline_id | UUID | Universally Unique IDentifier (UUID) of the pipeline. |
| task_id | UUID | Task identifier |
| execution_type | VARCHAR | The type of the task. |
| parent_task_id | UUID | Identifier of the parent task of the task |
| location_type | VARCHAR | The type of location where the task must run. |
| location_id | VARCHAR | The identifier for the location where the task must run. |

| Column Name | Column Type | Column Description |
|---|---|---|
| task_owner_id | UUID | Identifier of the node that is running the task |
| admin_owner_id | UUID | Identifier of the node that is monitoring the task |
| status | VARCHAR | Current task status |
| details | VARCHAR | The details or results of the status for the current task. |
| start_time | TIMESTAMP | The start time of the task. |
| end_time | TIMESTAMP | The end time of the task. |
| duration | BIGINT | Task duration in milliseconds |

## sys.pipelines

This table contains all of the pipelines in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | Universally Unique IDentifier (UUID) of the pipeline. |
| name | CHAR | Name of the pipeline. |
| database_id | UUID | UUID of the database of the pipeline (sys.databases). |
| loading_mode | CHAR | Specifies whether the pipeline runs in a one-time (BATCH), one-time transactional (TRANSACTIONAL), or continuous (CONTINUOUS) way. |
| source_type | CHAR | Source of the data (S3, KAFKA, FILESYSTEM). |
| data_format | CHAR | Structure of the data (CSV, DELIMITED, JSON, BINARY, PARQUET, XML, ASN1, AVRO). |
| created_at | TIMESTAMP | Timestamp that indicates when this pipeline was created. |
| altered_at | TIMESTAMP | Timestamp that indicates when this pipeline was last updated. |
| creator_id | UUID | The UUID of the user or group who created the pipeline (sys.users/sys.groups). |
| status | CHAR | Status of the pipeline (QUEUED, RUNNING, STOPPED, COMPLETED, FAILED, QUIESCING, QUIESCED). |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| status_message | CHAR | Status message of the pipeline. |
| task_id | UUID | Universally Unique IDentifier (UUID) of the task (sys.tasks). |
| rolehostd_version | CHAR | The rolehostd version in which this table was created |
| pending_files_count | LONG | The number of files with the `PENDING` status (sys.pipeline_files). |
| queued_files_count | LONG | The number of files with the `QUEUED` status (sys.pipeline_files). |
| loading_files_count | LONG | The number of files with the `LOADING` status (sys.pipeline_files). |
| loaded_files_count | LONG | The number of files with the `LOADED` status (sys.pipeline_files). |
| loaded_with_errors_files_count | LONG | The number of files with the `LOADED_WITH_ERRORS` status (sys.pipeline_files). |
| failed_files_count | LONG | The number of files with the `FAILED` status (sys.pipeline_files). |
| skipped_files_count | LONG | The number of files with the `SKIPPED` status (sys.pipeline_files). |
| transaction_id | UUID | The UUID of the transaction scope if this pipeline runs in a one-time transactional way. |

# Security

## sys.security_settings

This table contains security settings.

| Column Name | Column Type | Column Description |
|---|---|---|
| database_id | UUID | The database for this setting. This might be NULL for system-wide settings |
| group_id | UUID | The group for this setting when the setting is for a group |
| password_minimum_length | INT | Minimum password length. |
| password_complexity_level | INT | Password complexity requirement. |

| Column Name | Column Type | Column Description |
|---|---|---|
| password_lifetime_days | INT | Password lifetime in days. |
| password_no_repeat_count | INT | Password repetition count. |
| password_invalid_attempt_limit | INT | Invalid password attempt limit. |

# Security Integrations

## sys.oidc_integrations

This table enumerates the configuration for OpenID Connect Single Sign-On integrations (i.e. OKTA®). You can modify this configuration using the ALTER DATABASE <database> ALTER SSO INTEGRATION oidc DDL statement where <database> is the name of your database.

| Column Name | Column Type | Column Description |
|---|---|---|
| security_integration_id | UUID | The id of this OpenID Connect (OIDC) Single Sign-On integration. |
| database_id | UUID | The id of the database using this Single Sign-On authorization to this integration. |
| disabled | BOOLEAN | When true, all new connections made using this Single Sign-On integration will fail. |
| default_group | CHAR | The group which all users of this Single Sign-On intergation are granted membership to. |
| issuer | CHAR | The complete URL for the OAuth 2.0 / OpenID Connect Authorization Server. This is the expected “iss” claim in an access token. |
| client_id | CHAR | The provider-supplied ID of this Single Sign-On integration. |
| public_client | BOOLEAN | When true, PKCE is used in place of a client authentication method |
| enable_id_token_authentication | BOOLEAN | When true, a fat ID Token is sufficient to connect to the database. |
| user_id_claims | ARRAY(CHAR) | The id token claim(s) used to identify users in audit trails. |
| additional_scopes | ARRAY(CHAR) | Request scopes for authorization requests. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| additional_audiences | ARRAY(CHAR) | Additional token audience to accept when validating tokens. This is useful for Authorization Servers without a token exchange capability. |
| groups_claim_ids | ARRAY(CHAR) | The token claims that can be used to map the user to a Database group. You must provide `groups_claim_ids` if `groups_claim_mappings` is provided. |
| groups_claim_mappings | CHAR | The mappings from Provider group => Database group. |
| roles_claim_ids | ARRAY(CHAR) | The token claims that can be used to map the user to a Database role. You must provide `roles_claim_ids` if `roles_claim_mappings` is provided. |
| roles_claim_mappings | CHAR | The mappings from Provider role => Database role. |
| blocked_groups | ARRAY(CHAR) | Provider groups that are restricted from connecting to the database. |
| blocked_roles | ARRAY(CHAR) | Provider roles that are restricted from connecting to the database. |
| allowed_groups | ARRAY(CHAR) | Provider groups that are allowed to connect to the database. |
| allowed_roles | ARRAY(CHAR) | Provider roles that are allowed to connect to the database. |
| enable_debug_flow | BOOLEAN | |
| redirect_host | CHAR | Specifies the redirect host used in authorization requests. |
| redirect_ssl | BOOLEAN | Whether to use SSL for redirect URIs. |
| request_scopes | ARRAY(CHAR) | All request scopes for authorization requests. |
| scopes_on_refresh | BOOLEAN | Whether to include the scope list in the initial refresh-token request. The default value is `false`. |
| allow_offline_access | BOOLEAN | Whether to include `access_type=offline` and `prompt=consent` in the authorization URL. The default value is `false`. |

## sys.oidc_sessions

The sys.oidc_sessions table contains information about active database connections established using an OpenID Connect (oidc) Single Sign-On integration.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | The unique identifier for this session. |
| user | CHAR | The Fully Qualified User Name (FQUN) of this user. |
| database_id | UUID | The id of the database associated with this session. |
| security_integration_id | UUID | The id of the OpenID Connect (OIDC) Single Sign-On integration that authorized. |
| has_access_token | BOOLEAN | True if the identity provider supplied an Access Token. |
| has_refresh_token | BOOLEAN | True if the identity provider supplied a Refresh Token. |
| compact_id_token | CHAR | The JWS compact serialization form of the ID Token. |
| id_token_json | CHAR | The ID Token claims. |

## sys.security_integrations

This table contains the OIDC security integrations installed on the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | UUID of the OIDC security integration. |
| database_id | UUID | UUID of the database associated with this security integration (sys.databases). |
| integration_type | CHAR | The type of the security integration (SSO, SCIM, LDAP, etc.). |
| table_descriptor | CHAR | An indirect pointer to the table where you can view the objects of this integration. |
| sso_integration_name | CHAR | SSO integration name, if the security integration is of type SSO |
| is_database_default | BOOLEAN | When true, the security integration is used as the default SSO integration for the database. |

## sys.sessions

This table contains information about active client connections.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | The unique identifier for this session. |
| user | CHAR | The Fully Qualified User Name (FQUN) of this user. |
| sso_protocol | CHAR | The Single Sign-On (SSO) protocol used to authorize the connection request. Null if basic password authentication was used. Tables exists for each SSO protocol using the following naming scheme: “<protocol>_sessions”. For example, all sessions created using the OpenID Connect (oidc) protocol will be listed in the “sys.oidc_sessions” table. |
| database_id | UUID | The id of the database associated with this session. |
| default_schema | CHAR | The default schema used for queries submitted by this user. |
| created_at_timestamp | LONG | The number of seconds from epoch the session was established. |
| duration | LONG | The number of seconds since the session was established. |
| expires_at_timestamp | LONG | The number of seconds from epoch the session expires. |
| refresh_expires_at_timestamp | LONG | The number of seconds from epoch the refresh token expires. |
| is_renewable | BOOLEAN | When the value is `true`, the database attempts to extend the session when it expires. |
| client_ip | CHAR | The IP address of the client. |
| client_name | CHAR | The human-readable name of the client. |
| client_session_id | CHAR | An opaque identifier provided by client implementations. Used to correlate events across application boundaries. |
| protocol_version | CHAR | The version of the client-server protocol for this connection. |
| driver_version | CHAR | The version of the client driver. |
| tls_enabled | BOOLEAN | True if TLS is enabled for this client connection. |
| node_id | UUID | The unique identifier of the node the client is connected to. |

| Column Name | Column Type | Column Description |
|---|---|---|
| connectivity_pool_id | UUID | The unique identifier of the connectivity pool the client is connected on. |
| group_names | CHAR | Names of all groups in the session. |
| role_names | CHAR | Names of all roles in the session. |
| active_service_class_names | CHAR | Names of all active service classes in the session. |
| inactive_service_class_names | CHAR | Names of all inactive service classes in the session. |

# Statistics

## sys.average_bb_sizes

This table contains the average size of bounding boxes in the database for geospatial data types.

| Column Name | Column Type | Column Description |
|---|---|---|
| table_id | UUID | Universally Unique IDentifier (UUID) of the table (sys.tables). |
| column_id | UUID | UUID of the column (sys.columns). |
| avg_width | DOUBLE | Average width of bounding boxes in this column. |
| avg_height | DOUBLE | Average height of bounding boxes in this column. |

## sys.average_column_sizes

This table contains the average size of each column in the database.

| Column Name | Column Type | Column Description |
|---|---|---|
| table_id | UUID | Universally Unique IDentifier (UUID) of the table (sys.tables). |
| column_id | UUID | UUID of the column (sys.columns). |
| size | DOUBLE | Average size of the column. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

## sys.column_cardinalities

This table contains estimates of the number of unique values in each column in the database. These estimates might not reflect recent loading or deletion activity.

| Column Name | Column Type | Column Description |
|---|---|---|
| table_id | UUID | The Universally Unique IDentifier (UUID) of the table (sys.tables). |
| column_id | UUID | UUID of the column (sys.columns). |
| cardinality | LONG | The estimate of the number of unique values in this column. |
| stats_type | CHAR | Represents the type of values, either ‘COLUMN’ or ‘INNER_ARRAY’. |
| num_included_rows | LONG | The estimate of the total number of non-NULL rows (where this column value is not NULL) in the table that are included in this distinct estimate. |
| num_excluded_rows | LONG | The estimate of the total number of rows in the table that are not included in this distinct estimate. |

## sys.column_distributions

This table contains some statistical characteristics of the calculated Kernel Density Distribution of data in the database columns.

| Column Name | Column Type | Column Description |
|---|---|---|
| table_id | UUID | Universally Unique IDentifier (UUID) of the table (sys.tables). |
| column_id | UUID | UUID of the column (sys.columns). |
| bandwidth | DOUBLE | Smoothing parameter for the distribution. |
| minimum_value | DOUBLE | Minimum value found in the distribution. |
| maximum_value | DOUBLE | Maximum value found in the distribution. |
| stats_type | CHAR | Represents the type of values in the distribution, either ‘TABLE’ or ‘INNER_ARRAY’. |
| num_samples | LONG | The number of sampled row values included in the Kernel Density Distribution. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

## sys.columns_compression_info

This table contains column-level compression statistics for fixed-length columns. The system calculates statistics from the column data across all segments.

| Column Name | Column Type | Column Description |
|---|---|---|
| node_id | UUID | Universally Unique IDentifier (UUID) of the node that owns the segments included in these statistics. |
| table_id | UUID | UUID of the table of this column (sys.tables). |
| ordinal | INT | Ordinal of the column. |
| is_deltadelta_enabled | BOOLEAN | Specifies whether deltadelta compression is enabled. |
| is_rle_enabled | BOOLEAN | Specifies whether RLE compression scheme is enabled. |
| is_ne_enabled | BOOLEAN | Specifies whether the NULL elimination compression scheme is enabled. |
| raw_size | LONG | Size of the data in bytes before compression. |
| compressed_size | LONG | Size of the data in bytes after compression. |
| num_deltadelta_blocks | LONG | Number of data blocks compressed using the deltadelta compression. |
| num_rle_blocks | LONG | Number of data blocks compressed using the RLE (Run-Length Encoding) compression scheme. |
| num_nerle_blocks | LONG | Number of data blocks compressed using a combination of the RLE and NE (NULL Elimination) compression schemes. |
| num_uncompressed_blocks | LONG | Number of uncompressed data blocks. |
| num_total_blocks | LONG | Total number of data blocks. |
| id | UUID | UUID of the column |
| name | CHAR | Name of the column |

## sys.segments_compression_info

This table contains segment-level compression statistics. The system calculates statistics from the data within the specified segment. All block statistics apply only to fixed-length

columns within the segment. Non-block specific statistics (e.g., size information) include both fixed and variable-length columns.

| Column Name | Column Type | Column Description |
|---|---|---|
| table_id | UUID | Universally Unique IDentifier (UUID) of the table relevant to this segment (sys.tables). |
| segment_id | UUID | UUID for the segment. |
| num_deltadelta_blocks | LONG | Number of data blocks compressed using deltadelta compression |
| num_rle_blocks | LONG | Number of data blocks compressed using RLE (Run-Length Encoding) compression scheme |
| num_nerle_blocks | LONG | Number of data blocks compressed using a combination of RLE and NE (Null Elimination) compression schemes |
| num_uncompressed_blocks | LONG | Number of uncompressed data blocks |
| num_total_blocks | LONG | Total number of data blocks |
| raw_size | LONG | Size of the data part before any compression and without any parity data |
| compressed_size | LONG | Size of the data part after compression and without any parity data + Size of the manifest part |
| compressed_data_part_size | LONG | Size of the data part after compression and without any parity data |
| num_cluster_keys | LONG | Number of unique cluster keys in the segment |
| num_time_buckets | LONG | Number of time buckets in the segment |

## sys.stats_files

This table contains information about the on-disk cache for each Foundation Node of the local table probability density functions (PDFs) and array PDFs.

| Column Name | Column Type | Column Description |
|---|---|---|
| node_id | UUID | The Universally Unique IDentifier (UUID) of the node. References id in sys.nodes. |
| table_id | UUID | The UUID of the table. References id in sys.tables. |
| file_id | UUID | The UUID of the file. |

| Column Name | Column Type | Column Description |
|---|---|---|
| file_type | CHAR | The type of this file. Values are ARRAY_PDF, TABLE_PDF, or TABLE_CDE. |
| file_size | LONG | Size in bytes of the file. |
| column_ordinal | LONG | Ordinal of the column where the stats file applies. The ordinal references sys.columns for the specified table. The value is NULL when file_type is TABLE_PDF. |
| updated_at | TIMESTAMP | Timestamp of the last update to this file. |
| is_stale | BOOLEAN | Whether any rows are present on disk that were not present when this stats file was last updated |
| rows_computed_from | LONG | Number of rows present on the node when this stats file was last updated |
| marked_stale_at | TIMESTAMP | Timestamp of this file being marked stale. |

## sys.table_cardinalities

This table contains estimates of the number of rows in the individual tables in the database. These estimates might not reflect recent loading or deletion activity.

| Column Name | Column Type | Column Description |
|---|---|---|
| table_id | UUID | Universally Unique IDentifier (UUID) of the table (sys.tables). |
| cardinality | LONG | Estimate of the number of rows in this table. |

## sys.vl_columns_compression_info

This table contains column-level compression statistics for variable-length columns. The system calculates statistics from the column data across all segments.

| Column Name | Column Type | Column Description |
|---|---|---|
| node_id | UUID | Universally Unique IDentifier (UUID) of the node that owns the segments included in these statistics. |
| table_id | UUID | UUID of the table (sys.tables). |
| ordinal | INT | Ordinal of the column. |
| is_compression_enabled | BOOLEAN | Whether compression is enabled. |

| Column Name | Column Type | Column Description |
|---|---|---|
| raw_size | LONG | Size of the data in bytes before compression. |
| compressed_size | LONG | Size of the data in bytes after compression. |
| num_lz4_rows | LONG | Number of lz4 compressed rows. |
| num_uncompressed_rows | LONG | Number of uncompressed rows. |
| num_null_rows | LONG | Number of NULL rows. |
| num_total_rows | LONG | Total number of rows. |
| id | UUID | UUID of the column |
| name | CHAR | Name of the column |

# Storage

## sys.addendum_directories

This table contains all addendum directories with details about their associated directories and metadata.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | The identifier of the addendum directory within the storage cluster state. |
| associated_directory_group_id | CHAR | The group identifier of the associated directory. |
| associated_directory_ida_offset | INT | The IDA offset (the logical segment in a segment directory group) of the associated directory. |
| parent_segment_group_id | CHAR | The segment group identifier of the associated parent segment (sys.segment_groups). |
| parent_ida_offset | INT | The IDA offset of the associated parent segment. |
| segment_part_inventory_name | UUID | The name of the segment part inventory for the addendum part. This name references the id column of the segment_part_inventory system catalog table. |

| Column Name | Column Type | Column Description |
|---|---|---|
| segment_part_inventory_storage_id | CHAR | The storage identifier of the segment part inventory. |
| num_deleted_rows | LONG | If the segment part inventory houses a delete part, this number is the number of rows subtracted from the parent segment. |
| is_replica_for_ida_offset | INT | The IDA offset of the parent segment that this segment part inventory replicates. |

## sys.current_osn

This table contains the current Ownership Sequence Number (OSN) for each cluster on the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| start_osn | CHAR | The start OSN for the cluster. |
| end_osn | CHAR | The end OSN for the cluster. |
| cluster_id | UUID | The Universally Unique IDentifier (UUID) of the cluster. |

## sys.data_usage

This table contains information about the amount of queryable data for each table and file type.

| Column Name | Column Type | Column Description |
|---|---|---|
| segment_type | VARCHAR | The type of the segment. |
| database_name | VARCHAR | The name of the database for the table. |
| schema | VARCHAR | The schema of the table. |
| name | VARCHAR | The name of the table. |
| num_segments | BIGINT | The number of segments of a specific segment type. |
| total_rows | BIGINT | The total number of rows for segments of a specific segment type. |
| avg_rows_per_segment | DOUBLE | The average amount of rows per segment for a segment of a specific segment type. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| total_size_gb | DOUBLE | The total size in gigabytes for all segments of a specific segment type. |
| avg_size_mb | DOUBLE | The average size in megabytes for segments of a specific segment type. |

## sys.degraded_segment_groups

This table contains information about degraded segment groups in addition to the clusters and tables where they are located.

| Column Name | Column Type | Column Description |
|---|---|---|
| cluster_id | UUID | The unique identifier of the cluster. |
| cluster_name | VARCHAR | The name of the cluster. |
| segment_group_status | VARCHAR | The segment group status. |
| database_name | VARCHAR | The name of the database for the table. |
| schema | VARCHAR | The schema of the table. |
| name | VARCHAR | The name of the table. |
| degraded_segment_groups | BIGINT | The total number of damaged segment groups in a cluster. |

## sys.merge_eligibilities

This table computes and displays a count of segment groups and segment directory groups eligible for merging for each table in the Ocient System.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | Universally Unique IDentifier (UUID) of the table (sys.tables). |
| database_name | VARCHAR | Name of the database for the table. |
| schema | VARCHAR | Name of the schema. |
| name | VARCHAR | Name of the table. |
| segment_groups_merge_eligible | BIGINT | The count of segment groups eligible for merging in the table. |

## sys.merge_policies

This table computes and displays the effective merge policy (enabled or disabled) for each table in the system. The system bases the policy on the default configuration and any overrides that are present for each table.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | Universally Unique IDentifier (UUID) of the table (sys.tables). |
| database_name | VARCHAR | Name of the database for the table. |
| schema | VARCHAR | Name of the schema. |
| name | VARCHAR | Name of the table. |
| table_lts_property_string | VARCHAR | Additional properties assigned to control the Foundation role (formerly “LTS role”) behavior for the table. |
| effective_table_merge_policy | VARCHAR | The effective merge policy applied to this table based on the value of the global `feature_directory_merge` feature flag and an optional table merge policy override. |

## sys.orphaned_segments

This table contains information about orphaned segments in the cluster.

| Column Name | Column Type | Column Description |
|---|---|---|
| storage_id | UUID | The Universally Unique IDentifier (UUID) for the orphaned segment. |
| owner | LONG | The identifier of the owner for this orphaned segment. |
| segment_type | CHAR | The type of the segment (TKT, PAGE, etc.). |
| node_id | UUID | The UUID of the node where the system stores the orphaned segment. |
| cluster_id | UUID | The UUID of the storage cluster (sys.clusters) where the node of the segment belongs. This value is NULL if the node is not a member of a storage cluster. |

## sys.segment_directories

This table contains all segment directories with details about parents, associated buckets, and metadata.

| Column Name | Column Type | Column Description |
|---|---|---|
| segment_group_id | CHAR | The identifier of the segment group (sys.segment_groups). |
| ida_offset | INT | The unique index of the segment. |
| storage_id | UUID | The storage identifier of the segment directory. |
| owner | LONG | The owner identifier of this stored segment. |
| table_id | UUID | Universally Unique IDentifier (UUID) of the table (sys.tables). |
| begin_time | LONG | Start time of the bucket of this segment directory in the time bucket column of its table. |
| end_time | LONG | End time of the bucket of this segment directory in the time bucket column of its table. |
| depth | INT | The depth of the segment group. A non-zero value indicates a segment directory group. |
| parent_segment_group_id | CHAR | The parent identifier of the segment directory group (sys.segment_groups). |
| parent_ida_offset | INT | The unique index of the parent segment, if it exists. |
| parent_storage_id | UUID | The storage identifier of the parent segment directory, if it exists. |

| Column Name | Column Type | Column Description |
|---|---|---|
| parent_owner | LONG | The owner of the parent storage identifier. A zero value indicates an unowned storage identifier. Whereas a non-zero value indicates a segment owned after rebuild. |
| row_count | LONG | If the directory depth equals 1, then this count is the number of rows in the base leaf segment (not factoring in any DELETE SQL statements). If the depth is greater than 1, then this count is the total number of rows spanned by the intermediate directory. |
| created_time | TIMESTAMP | Specifies the time, in nanoseconds, when this segment group was created. |
| rolehostd_version | CHAR | The version of the rolehostd binary at the time of the segment group generation. |

## sys.segment_group_transfers

This table contains all segment group transfers between clusters.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | Universally Unique IDentifier (UUID) of the segment group transfer. |
| src_cluster_id | UUID | UUID of the source cluster (sys.clusters). |
| dst_cluster_id | UUID | UUID of the destination cluster (sys.clusters). |
| status | CHAR | The status of the transfer. |
| segment_group_ids | ARRAY(CHAR) | List of the identifiers of segment groups in this transfer (sys.segment_groups). |
| src_committed_osn | CHAR | The Ownership Storage Number (OSN) in which the segment groups are considered fully transferred from the source cluster. |
| dst_committed_osn | CHAR | The OSN in which the segment groups are considered fully transferred from the destination cluster. |

## sys.segment_groups

This table contains all segment groups stored on the cluster with details about the ownership, associated table, data structure, and other metadata.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | CHAR | The identifier of the segment group. |
| cluster_id | UUID | Universally Unique IDentifier (UUID) of the internal cluster of this segment group. |
| segment_type | CHAR | Type of the segment (TKT, PAGE, etc.). |
| status | CHAR | The availability and health status of the segment group. |
| primary_owner | UUID | For a replicated segment group, the UUID of the node that serves the segment (sys.nodes). |
| loader_id | UUID | The streamloader node that wrote the segment group (sys.nodes). |
| table_id | UUID | UUID of the table (sys.tables). |
| scope_id | UUID | UUID of the storage scope (sys.storage_scopes). |
| block_size | LONG | Disk block size used to store segments in this group in bytes. |
| begin_time | LONG | Inclusive minimum bucket value, specified as an integer, for all rows in this segment group. If the bucket column is a date or time value, this column has the same unit of measure as defined by the TimeKey column and you can convert or compare it to other dates or times with the appropriate conversion functions. When you specify a TIMESTAMP TimeKey, the value represents nanoseconds after the epoch. |
| end_time | LONG | Inclusive maximum bucket value, specified as an integer, for all rows in this segment group. If the bucket column is a date or time value, this column has the same unit of measure as defined by the TimeKey column and you can convert or compare it to other dates or times with the appropriate conversion functions. When you specify a TIMESTAMP TimeKey, the value represents nanoseconds after the epoch. |
| begin_timestamp | TIMESTAMP | Inclusive minimum bucket value, specified as a TIMESTAMP, for all rows in this segment group. If the bucket column is a unitless integer, this column is NULL. |
| end_timestamp | TIMESTAMP | Inclusive maximum bucket value, specified as an integer, for all rows in this segment group. If the bucket column is a unitless integer, this column is NULL. |
| coding_algorithm | CHAR | Coding algorithm used to erasure code this group (NO_CODING, PQ_PARITY, REED_SOLOMON). |
| coding_block_size | INT | The unit size that is erasure coded in bytes. |

| Column Name | Column Type | Column Description |
|---|---|---|
| coding_threshold | INT | The number of coding blocks required to rebuild all blocks in a coding line. |
| coding_width | INT | The number of coding blocks in a coding line. |
| replication | INT | The number of replicas of each segment in the group. |
| parity_cycle | INT | Parity cycle that the system calculates by multiplying by the coding_width to return the number of segments in the segment group. |
| created_time | TIMESTAMP | Specifies the time, in nanoseconds, when this segment group was created. |
| rolehostd_version | CHAR | The version of the rolehostd binary at the time of the segment group generation. |
| commit_hash | CHAR | The commit hash of the rolehostd binary at the time of the segment group generation. |
| timestamp | CHAR | The build timestamp or commit timestamp of the rolehostd binary at the time of the segment group generation. |
| build_user | CHAR | The build user of the rolehostd binary at the time of the segment group generation. |
| depth | INT | The depth of the segment directory group. A non-zero value indicates a segment directory group. |
| removal_type | CHAR | The method by which a segment group was removed. |
| visibility | CHAR | The visibility of the segment group. |
| regeneration_group | UUID | The UUID of the regeneration group. |
| regeneration_types | ARRAY(CHAR) | Type of regeneration with these values: `REINDEX` for reindexing and `REAGG` for reaggregation. |

## sys.segment_part_inventory

This table contains information about the inventory of markers for segments. For example, a marker denotes whether the database can delete a specific segment part. One segment can have multiple inventories, whereas each inventory contains only one marker.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | The universally unique identifier (UUID) of the inventory that stores the markers for segments. |
| ida_offset | INT | The IDA offset (the logical part of the segment) denotes the position within the segment. |
| parent_segment_group_id | CHAR | The identifier of the segment group where the parent segment is located. |
| parent_ida_offset | INT | The IDA offset where the parent segment is located within the segment group. |
| num_deleted_rows | LONG | The number of deleted rows. |
| operation_id | UUID | The UUID of the query where the Ocient System creates the inventory (the `DELETE` SQL statement). The system shares this UUID across all inventories created in the same operation. |
| subsuming_type | CHAR | The type of the marker within the inventory. |
| node_id | UUID | The UUID of the node that contains the latest segment with the part. |

## sys.segment_part_redundancy_info

This table contains the redundancy strategy for each table and the segment part type.

| Column Name | Column Type | Column Description |
|---|---|---|
| table_id | UUID | Universally Unique IDentifier (UUID) of the table (sys.tables). |
| part_name | CHAR | Name of the segment part. |
| redundancy_type | CHAR | The redundancy strategy for this part (COPY, PARITY). |

## sys.segment_parts

This table contains the segment parts associated with each segment group. These segment parts belong to queryable segments. The table does not display parts that belong to quarantined segments or segments not yet activated.

| Column Name | Column Type | Column Description |
|---|---|---|
| segment_group_id | CHAR | The identifier of the segment group (sys.segment_groups). |
| ida_offset | INT | Unique index of the segment. The original copy of this segment part belongs to this segment. |
| name | CHAR | Name of the segment part. |
| part_type | CHAR | Partial identifier of a segment part (DATA, INDEX, MANIFEST, STATS). |
| size | LONG | Size of the segment part in bytes. |
| segment_ida_offset | INT | Unique index of a segment within a segment group. |
| segment_lba_offset | LONG | Offset of this segment part within the Logical Block Address (LBA) on disk. |

## sys.segments

This table contains the individual segments stored in each storage cluster including basic information about the segment and the segment group where the segment belongs. The table contains queryable segments only. Quarantined segments or segments not yet activated do not appear in this table (they are present in the sys.stored_segments table).

| Column Name | Column Type | Column Description |
|---|---|---|
| segment_group_id | CHAR | The identifier of the segment group (sys.segment_groups). |
| segment_type | CHAR | Type of the segment (TKT or PAGE). |
| ida_offset | INT | Unique index of the segment in the segment group. |
| row_count | LONG | Count of accessible rows in the segment. If the count is unknown, the value is NULL. |
| storage_id | UUID | Universally Unique IDentifier (UUID) for the stored segment (sys.stored_segments.storage_id). |
| table_id | UUID | Universally Unique IDentifier (UUID) of the table (sys.tables). |
| segment_size | LONG | Size of the segment in bytes. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| root_segment_directory_group_id | CHAR | The identifier of the root-level segment directory group to which this segment belongs. For root-level directories and non-subsumed segments, this value is the same as the `segment_group_id` column. |
| root_segment_directory_group_ida_offset | INT | The unique index of the directory in the root-level directory group to which this segment belongs. |
| begin_time | LONG | Inclusive minimum bucket value, specified as an integer, for all rows in this segment. If the bucket column is a date or time value, this column has the same unit of measure as defined by the TimeKey column and you can convert or compare it to other dates or times with the appropriate conversion functions. When you specify a TIMESTAMP TimeKey, the value represents nanoseconds after the epoch. |
| end_time | LONG | Inclusive maximum bucket value, specified as an integer, for all rows in this segment. If the bucket column is a date or time value, this column has the same unit of measure as defined by the TimeKey column and you can convert or compare it to other dates or times with the appropriate conversion functions. When you specify a TIMESTAMP TimeKey, the value represents nanoseconds after the epoch. |
| begin_timestamp | TIMESTAMP | Inclusive minimum bucket value, specified as a TIMESTAMP, for all rows in this segment. If the bucket column is a unitless integer, this column is NULL. |
| end_timestamp | TIMESTAMP | Inclusive maximum bucket value, specified as an integer, for all rows in this segment. If the bucket column is a unitless integer, this column is NULL. |
| owner | LONG | Owner identifier of this stored segment. |

| Column Name | Column Type | Column Description |
|---|---|---|
| num_deleted_rows | LONG | Number of rows deleted from this segment. |
| page_size_with_replication | LONG | Specifies the replication of stored pages. |

## sys.stop_osn_reap_requests

This table contains the list of active requests that guard the Ownership Sequence Number (OSN) from reaping. Each request guards the OSN that was current at creation (guard_osn): the cluster might reap older OSNs, but never ones newer than the guard. Guarding ends for an OSN after the system removes all requests guarding it.

| Column Name | Column Type | Column Description |
|---|---|---|
| request_id | UUID | The Universally Unique IDentifier (UUID) of the request. |
| created_at | TIMESTAMP | The timestamp that represents when the request was created. |
| description | CHAR | The description of the request. |
| cluster_id | UUID | The UUID of the cluster. |
| guard_osn | LONG | The OSN this request guards. Reaping might advance the cluster start OSN up to this value but never past it. |

## sys.storage_capacity

This table contains information about storage capacity for each node.

| Column Name | Column Type | Column Description |
|---|---|---|
| node_id | UUID | Universally Unique IDentifier (UUID) of the node (sys.nodes). |
| capacity_bytes | LONG | Approximate storage capacity of the node in bytes. |
| cluster_id | UUID | UUID of the cluster (sys.clusters). |

## sys.storage_device_files

This table contains the list of all files for each storage device.

| Column Name | Column Type | Column Description |
|---|---|---|
| node_id | UUID | The Universally Unique IDentifier (UUID) of the node. |
| device_id | INT | The numeric identifier of the drive. |
| storage_id | UUID | The UUID of the file. |
| owner | LONG | Owner of the storage identifier. The zero value indicates an unowned storage identifier. A non-zero value indicates a segment owned after the rebuild. |
| segment_type | CHAR | The type of the segment (TKT, PAGE, etc.). |
| parent_id | UUID | The UUID of the parent file (for addendum parts). |
| normalized_drive_slot | INT | Theoretical drive slot, if applicable, that was computed from the segment group identifier. The Ocient System expects to allocate the file to this slot. |
| abnormal_placement | BOOLEAN | Specifies whether the Ocient System places the segment abnormally. If this value is `true`, the segment is not located on the drive slot that was computed from the segment group identifier. |
| segment_group_id | CHAR | The identifier of the segment group (sys.segment_groups). |
| cluster_id | UUID | The UUID of the storage cluster (sys.clusters) where the node of the device belongs. This value is NULL if the node is not a member of a storage cluster. |

## sys.storage_scopes

This table contains the storage scopes defined in the system with the number of rows, page groups, and segment groups in each storage scope.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | Universally Unique IDentifier (UUID) of the storage scope. |
| row_count | LONG | The number of rows that have been currently loaded onto the scope. |
| num_page_groups | LONG | The number of page groups currently present in the scope. |
| num_tkt_segment_groups | LONG | Number of TKT segment groups currently present in the scope. |

| Column Name | Column Type | Column Description |
|---|---|---|
| scope_prefix_len | INT | The prefix length of the scope. |
| transaction_timeout | LONG | The transaction timeout of the scope. |
| creation_timestamp | TIMESTAMP | The timestamp when the scope was created. |
| last_activity_timestamp | TIMESTAMP | The timestamp when the scope was last updated. |
| cluster_id | UUID | UUID of the cluster (sys.clusters). |

## sys.storage_spaces

This table contains information for all defined storage spaces.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | Universally Unique IDentifier (UUID) of the storage space. |
| name | CHAR | Name of the storage space. |
| is_system_storage_space | BOOLEAN | Is this storage space the system storage space |
| block_size | INT | Unit size that is erasure coded in bytes. |
| total_width | INT | The coding width. (The N in an M of N parity configuration.) |
| parity_width | INT | Within a coding line, the number of blocks dedicated to storing parity information. |
| parity_type | CHAR | The methodology used to compute parity blocks (P+Q, XOR, REED SOLOMON, REPLICATION, NONE). |
| parity_cycles | INT | Parity cycles calculated by multiplying by total_width to return the number of segments in the segment group. |
| page_replication | INT | The total number of page replicas, which includes the original page. |

## sys.storage_used

This table contains information about storage utilization for each node.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| node_id | UUID | Universally Unique IDentifier (UUID) of the node (sys.nodes). |
| table_id | UUID | UUID of the table (sys.tables). |
| used_bytes | LONG | Approximate storage utilization of the table on the node in bytes. |
| cluster_id | UUID | UUID of the cluster (sys.clusters). |

## sys.stored_leaf_segment_part_inventory

This table contains the physical location for the inventory of markers for all segments.

| Column Name | Column Type | Column Description |
|---|---|---|
| segment_group_id | CHAR | The identifier of the segment group (sys.segment_groups). |
| cluster_id | UUID | Universally Unique IDentifier (UUID) of the cluster (sys.clusters). |
| ida_offset | INT | Index of the segment in the segment group. |
| storage_id | UUID | UUID of the stored segment. |
| owner | LONG | Owner identifier of the stored segment. |
| root_directory_group_id | CHAR | Root segment directory identifier, if it has been subsumed. |
| node_id | UUID | UUID of the node (sys.nodes). |
| start_osn | CHAR | The starting Ownership Sequence Number (OSN) for the latest OSN range of the inventory of markers. |
| end_osn | CHAR | The ending OSN for the latest OSN range of the inventory of markers. |
| kind | CHAR | The kind of segment (DISK, VIRTUAL). |
| visibility | CHAR | The visibility of the inventory of markers. |
| toc_name | UUID | UUID of the inventory of markers. A NULL UUID denotes the main inventory of markers of the segment. |
| row_count | LONG | The number of rows in the base leaf segment (not factoring in any DELETE SQL statements). |

© 2026 Ocient, Inc

## sys.stored_segments

This table contains details for each segment that is saved to disk.

| Column Name | Column Type | Column Description |
|---|---|---|
| segment_group_id | CHAR | The identifier of the segment group (sys.segment_groups). |
| cluster_id | UUID | Universally Unique IDentifier (UUID) of the cluster (sys.clusters). |
| ida_offset | INT | Index of the segment in the segment group. |
| storage_id | UUID | UUID of this stored segment. |
| owner | LONG | Owner identifier of this stored segment. |
| node_id | UUID | UUID of the node (sys.nodes). |
| status | CHAR | The current status of the segment (MISSING, INTACT, etc.). |
| kind | CHAR | The kind of segment (DISK, VIRTUAL). |
| start_osn | CHAR | The start OSN for the latest OSN range of the segment. |
| end_osn | CHAR | The end OSN for the latest OSN range of the segment. |
| visibility | CHAR | The visibility of the stored segment. Valid values are VISIBLE (segment is queryable), QUARANTINED (segment is not queryable), HIDDEN (segment is hidden), and INVALID (segment is invalid). During segment generation, the Ocient System can make segments hidden or invalid for a short period before the segments become queryable. |
| abnormal_placement | BOOLEAN | Whether the segment is placed abnormally. |
| row_count | LONG | Count of rows in the segment. |
| segment_size | LONG | Size of the segment in bytes. |

## sys.unhealthy_segments

This table contains information about nodes with damaged, missing, or invalid segments.

| Column Name | Column Type | Column Description |
|---|---|---|
| node_id | UUID | The unique identifier of the node. |

| Column Name | Column Type | Column Description |
|---|---|---|
| node_name | VARCHAR | The name of the node. |
| status | VARCHAR | The status of the stored segment. Values include INTACT, MISSING, and DAMAGED. |
| num_unhealthy_segments | BIGINT | The total number of unhealthy segments in the node. |

# System

## sys.clusters

This table contains all clusters defined in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | Universally Unique IDentifier (UUID) of the cluster (sys.clusters.id). |
| name | CHAR | Name of the cluster. |
| cluster_type | CHAR | Type of the cluster. |
| storage_space_ids | ARRAY(UUID) | UUIDs of the storage spaces used in this cluster (sys.storage_spaces.id). |

## sys.compute_configurations

This table contains the compute configurations for nodes and clusters in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| cluster_id | UUID | Universally Unique IDentifier (UUID) of the cluster that this node belongs to (sys.clusters.id). |
| node_id | UUID | UUID of the node (sys.nodes.id). |
| level | LONG | Execution level for this node or cluster. |
| csn | LONG | Compute sequence number. |

## sys.locks

This table contains information of the currently queued and granted lock requests.

| Column Name | Column Type | Column Description |
|---|---|---|
| request_id | UUID | The unique identifier of the lock. |
| owner_identifier | CHAR | The unique identifier of the owner of the lock. Should be of format `<node uuid with lowercase chars>.<locking system>.<locking reason>.<process uuid>` |
| lock_scope_id | CHAR | An identifier on the scope of the lock, should be of format `<system>.<type>.<target unique identifier>` |
| lock_type | CHAR | Whether the lock is to READ or WRITE on the elements in its scope. |
| status | CHAR | The status of the lock, QUEUED means that it is waiting to be accepted, GRANTED means it is currently active. |
| create_time | LONG | The creation time, in milliseconds, of the lock relative to the underlying RAFT Consensus Log. This value is not a UNIX timestamp. |
| last_refresh_time | LONG | The time, in milliseconds, when the lock was last refreshed relative to the underlying RAFT Consensus Log. This value is not a UNIX timestamp |
| priority_id | UUID | The identifier for lock prioritization. |
| create_timestamp | TIMESTAMP | The timestamp that represents when the lock was created on the Raft leader. |
| last_refresh_timestamp | TIMESTAMP | The timestamp that represents when the lock was most recently refreshed on the Raft leader. |

## sys.lts_cluster_info

This table contains the storage clusters defined in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| cluster_id | UUID | Universally Unique IDentifier (UUID) of the storage cluster (sys.clusters.id). |
| storage_space_ids | ARRAY(UUID) | UUIDs of the storage spaces used in this cluster (sys.storage_spaces.id). |

## sys.node_clusters

This table contains nodes that are members of each cluster.

| Column Name | Column Type | Column Description |
|---|---|---|
| cluster_id | UUID | Universally Unique IDentifier (UUID) of the cluster that this node belongs to. |
| node_id | UUID | UUID of the node. |
| ordinal | INT | Ordinal of this node. |

## sys.nodes

This table contains all nodes defined in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | Universally Unique IDentifier (UUID) of the node. |
| unique_node_number | INT | Ordinal number assigned to the node. |
| name | CHAR | Name of the node. |
| status | CHAR | Status of the node (ACCEPTED, UNACCEPTED, INVALID). |
| hostname | CHAR | Hostname of the node. |
| software_version | CHAR | Version of the software running on this node. |
| kernel_version | CHAR | Version of the kernel running on this node. |
| system_version | CHAR | Version of Linux® running on this node. |
| system_memory | LONG | Amount of available system memory in bytes. |
| sockets | INT | Number of CPU sockets. |
| cores_per_socket | INT | Number of cores per CPU socket. |
| hugepages_1gb | INT | Number of configured 1GB huge pages. |
| hugepages_2mb | INT | Number of configured 2MB huge pages. |
| hyperthreaded | BOOLEAN | Whether the node is hyperthreaded. |

## sys.service_roles

This table contains the service roles defined on each node.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | Universally Unique IDentifier (UUID) of the service role. |
| service_role_type | CHAR | Type of the service role. |
| node_id | UUID | UUID of the node. (sys.nodes.id) |
| level | CHAR | Execution level of the node. |

# System Information

## sys.function_signatures

This table contains all function signatures defined in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | Universally Unique IDentifier (UUID) of the function signature. |
| name | CHAR | Name of the function. |
| return_type | CHAR | Return type of the function. |
| arg_types | ARRAY(CHAR) | The types of all arguments in the function. |
| function_type | CHAR | Type of the function. |

## sys.reserved_words

This table contains all reserved words defined in Ocient.

| Column Name | Column Type | Column Description |
|---|---|---|
| reserved_word | CHAR | A word that is a reserved keyword for use by Ocient. |

## sys.sql_messages

This table contains information about the SQL errors and warnings that the Ocient System can produce.

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| name | CHAR | SQL error or warning name. |
| code | INT | SQL error or warning code. |
| state | CHAR | SQL error or warning state. |
| reason | CHAR | Description of the SQL error or warning. |
| is_error | BOOLEAN | Whether or not this SQL message is an error or warning. |

## sys.system_information

This table contains information about the Ocient System.

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| id | UUID | Universally Unique Identifier (UUID) for the overall system. |
| name | CHAR | The name of the system. This system assigns this name randomly using a UUID by default. You can change the name using the `ALTER SYSTEM RENAME` SQL statement. |
| current_compatible_software_version | INT | The minimum software version for the system compatibility. |
| allowed_compatible_software_version | INT | The software version that prevents the use of features in the newest version of the system to keep backward compatibility with the specified version in the `current_compatible_software_version` column. |
| feature_directory_merge | CHAR | The value of the `directory merge` feature flag for segment directory groups. |

## sys.system_table_columns

This table contains all columns for tables available in the system catalog.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | The Universally Unique IDentifier (UUID) of this column (sys.columns). |
| name | CHAR | The name of this column. |
| data_type | CHAR | The data type of the column. |
| nullable | BOOLEAN | Whether or not this column is nullable. |
| ordinal | LONG | The ordinal of this column. |
| schema_name | CHAR | The name of the schema to which this column belongs. |
| table_name | CHAR | The name of the table to which this column belongs. |
| description | CHAR | Description of the column. |

## sys.system_table_constraints

This table contains all constraints for tables available in the system catalog.

| Column Name | Column Type | Column Description |
|---|---|---|
| constraint_name | CHAR | The name of this constraint. |
| constraint_type | CHAR | The type of the constraint with valid values: `PRIMARY_KEY` or `FOREIGN_KEY`. |
| schema_name | CHAR | The name of the schema to which this constraint belongs. |
| table_name | CHAR | The name of the table to which this constraint belongs. |
| column_names | ARRAY(CHAR) | The names of the columns where the constraint applies. |
| referenced_schema_name | CHAR | The schema of the referenced table. This value is NULL for non-foreign key constraints. |
| referenced_table_name | CHAR | The name of the referenced table. This value is NULL for non-foreign key constraints. |
| referenced_column_names | ARRAY(CHAR) | The names of the columns where the referenced constraint applies. This value is NULL for non-foreign key constraints. |

### sys.system_tables

This table contains all tables available in the system catalog.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | Universally Unique IDentifier (UUID) of the table (sys.tables). |
| schema | CHAR | Schema of the table. |
| name | CHAR | Name of the table. |
| table_type | CHAR | Type of the table. |
| category | CHAR | Category of the table. |
| description | CHAR | Description of the table. |

## User Management

### sys.group_roles

This table contains roles that belong to each group.

| Column Name | Column Type | Column Description |
|---|---|---|
| group_id | UUID | Universally Unique IDentifier (UUID) of the group (sys.groups). |
| role_id | UUID | UUID of the role (sys.roles). |

### sys.groups

This table contains information, including the service class, related to each group.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | Universally Unique IDentifier (UUID) of the group. |
| name | CHAR | Name of the group. |
| database_id | UUID | UUID of the database (sys.databases). |
| service_class_id | UUID | UUID of the service class of this group (sys.service_classes). |

## sys.privileges

This table contains information related to the privileges granted in Ocient.

| Column Name | Column Type | Column Description |
|---|---|---|
| timestamp | TIMESTAMP | Timestamp of the grant given. |
| grantor | CHAR | The user who granted this privilege. |
| grantee | CHAR | The user who received this privilege. |
| privilege | CHAR | The privilege for the grant. |
| privilege_target | CHAR | The type of object to which the privilege applies. This value is NULL if the privilege applies to the granted object. |
| object_type | CHAR | The type of object on which this privilege was granted. |
| object_id | UUID | Universally Unique IDentifier (UUID) of the object. |
| grantable | BOOLEAN | Whether the user can grant this privilege to another user. |

## sys.rights

This table contains information related to the rights granted in Ocient.

| Column Name | Column Type | Column Description |
|---|---|---|
| entity_type | CHAR | Owner of the right (user, group, role). |
| entity_id | UUID | Universally Unique IDentifier (UUID) of the owner. |
| target_type | CHAR | Type of the target. |
| target_id | UUID | UUID of the target. |
| value | CHAR | The right being given (CREATE, READ, UPDATE, DELETE, SECURITY). |

## sys.roles

This table contains roles in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | Universally Unique IDentifier (UUID) of the role. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| database_id | UUID | UUID of the database of this role (sys.databases). |
| name | CHAR | Name of this role. |
| description | CHAR | Detailed description of this role. |

## sys.user_groups

This table contains the users that belong to groups in Ocient.

| Column Name | Column Type | Column Description |
|---|---|---|
| user_id | UUID | Universally Unique IDentifier (UUID) of the user (sys.users). |
| group_id | UUID | UUID of the group where the user belongs (sys.groups). |

## sys.user_roles

This table contains roles associated with each user.

| Column Name | Column Type | Column Description |
|---|---|---|
| user_id | UUID | Universally Unique IDentifier (UUID) of the user (sys.users). |
| role_id | UUID | UUID of the role (sys.roles). |

## sys.users

This table contains information about users in Ocient.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | Universally Unique IDentifier (UUID) of the user. |
| user_name | CHAR | Username. |
| database_id | UUID | UUID of the database. |
| first_name | CHAR | First name of the user. |
| last_name | CHAR | Last name of the user. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| email | CHAR | Email address of the user. |
| password_updated_at | TIMESTAMP | Timestamp that represents the date and time for the last time the password for this user was updated |
| state | CHAR | State. |
| invalid_login_attempts | INT | Number of invalid login attempts after the last successful login. |
| password_days_remaining | INT | Number of days remaining until the password expires. If you do not configure the password expiration, this value is NULL. |

# Workload Management

## sys.service_classes

This table shows information about the service classes used for workload management in Ocient. For more details on workload management, see the corresponding section of the user documentation.

| Column Name | Column Type | Column Description |
|---|---|---|
| id | UUID | The ID of the service class. |
| database_id | UUID | The ID of the database that has the service class. |
| name | CHAR | The name of the service class. |
| max_temp_disk_usage | LONG | The maximum temporary disk usage for a query running with this service class. |
| max_elapsed_time | LONG | The maximum time, in seconds, that a query running with this service class can run. |
| max_concurrent_queries | LONG | The maximum number of queries that can run concurrently with this service class. |
| max_rows_returned | LONG | The maximum number of rows a query running with this service class can return. |
| max_query_memory_bytes | LONG | The per-VM-node memory limit, in bytes, for a query running with this service class. -1 means unlimited. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| max_query_cpu_seconds | LONG | The per-VM-node CPU-time limit, in seconds, for a query running with this service class. -1 means unlimited. |
| scheduling_priority | DOUBLE | The initial priority for a query running with this service class. |
| cache_max_bytes | LONG | The maximum number of bytes in a result set, if it is eligible for cache storage, for a query running with this service class. |
| cache_max_time | LONG | The maximum amount of time, in seconds, that the system caches rows for a query running with this service class. |
| max_elapsed_time_for_caching | LONG | The maximum amount of time, in seconds, that a query running with this service class can run and have its result set cached. This value must be higher than the `max_elapsed_time` value. |
| max_columns_in_result_set | LONG | The maximum number of columns allowed in the result set of a query running with this service class. |
| priority_adjustment_factor | DOUBLE | The amount that the system adjusts the query priority in each time interval, as specified by the `priority_adjustment_time` value, for a query running with this service class. |
| priority_adjustment_time | LONG | The frequency, in seconds, of each priority adjustment for a query running with this service class. |
| min_priority | DOUBLE | The minimum value of the adjusted priority for a query running with this service class. |
| max_priority | DOUBLE | The maximum value of the adjusted priority for a query running with this service class. |
| statement_text | CHAR | Specifies the comparison string to use for matching statement text to queries. This string takes the format specified by the statement_text_matcher_type field. |
| statement_text_matcher_type | CHAR | Specifies the type of string comparison to use for matching statement text to queries. This value must be LIKE or REGEX and is required if you specify a ‘statement_text’ field. |
| half_parallelism | BOOLEAN | Determines whether the VM uses half of the available cores for each operator in this query rather than the maximum possible parallelism. Setting this value can reduce overhead and |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| | | latency for queries, but it significantly decreases data throughput. So, updating this value should be rare outside of Ocient Support work. |
| load_balance_shuffle | BOOLEAN | Determines whether the optimizer includes a load-balancing network operator above I/O for each query. This field can add latency to queries, but it will likely increase data throughput. If unset, the choice is left to the optimizer. So, updating this value should be rare outside of Ocient Support work. |
| parallelism | INT | Determines the number of parallel cores to use for each operator in the VM. This value must be nonzero. If unset, the choice is left to the VM. So, updating this value should be rare outside of Ocient Support work. |
| minimize_query_debug_records | BOOLEAN | This value determines whether the optimizer and VM should attempt to limit debug metrics and logging for queries associated with this service class. Limiting query observability may improve performance for workloads running many queries per second. |
| memory_optimal_strategy | BOOLEAN | This value determines whether the optimizer and VM should attempt to lower the memory requirements of a query regardless of potential execution time penalties. So, updating this value should be rare outside of Ocient Support work. |
| is_system_managed | BOOLEAN | This value indicates whether or not the service class is a system managed service class. |

## sys.service_classes_for_user

The `service_classes_for_user` table shows groups that each user belongs to and the service class for each group.

| Column Name | Column Type | Column Description |
|---|---|---|
| user_name | VARCHAR | Username. |
| group_name | VARCHAR | Name of the group. |
| service_class_name | VARCHAR | The name of the service class. |

# Information Schema

Explore the collection of system views that provide metadata about the Ocient System, such as table, data pipeline, and index information.

The system catalog exposes a set of system views in the `information_schema` schema that contain metadata about the Ocient® System. Most of these views follow the SQL standard with additional views specific to the system.

## Alphabetical List of Views

- `information_schema.columns`
- `information_schema.constraint_column_usage`
- `information_schema.data_types`
- `information_schema.databases`
- `information_schema.geometry_columns`
- `information_schema.groups`
- `information_schema.index_recommendations`
- `information_schema.indexes`
- `information_schema.information_schema_catalog_name`
- `information_schema.key_column_usage`
- `information_schema.mcp_tools`
- `information_schema.node_storage`
- `information_schema.nodes`
- `information_schema.parameters`
- `information_schema.pipeline_status`
- `information_schema.pipeline_status_historical`
- `information_schema.pipeline_table_metrics`
- `information_schema.pipelines`

# System View Descriptions

## information_schema.columns

The `columns` view shows information for all columns in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| table_catalog | VARCHAR | Name of the database. |
| table_schema | VARCHAR | Name of the schema. |
| table_name | VARCHAR | Name of the table. |
| column_name | VARCHAR | Name of the column. |
| ordinal_position | BIGINT | Ordinal of the column with respect to its table. |
| data_type | VARCHAR | Data type of the column (INT, CHAR, BOOLEAN, etc.). |
| is_nullable | VARCHAR | Specifies whether the values in this column can be NULL. |
| column_default | VARCHAR | The default expression of this column, if it exists. |

## information_schema.constraint_column_usage

The `constraint_column_usage` view identifies all columns in the system that are used by some constraint, which follows the SQL standard `information_schema.constraint_column_usage` specification. For a foreign key constraint,

the view identifies the columns that the foreign key references (in the referenced table). For a unique or primary key constraint, the view identifies the constrained columns.

| Column Name | Column Type | Column Description |
|---|---|---|
| table_catalog | VARCHAR | The name of the database that contains the table that contains the column that is used by the constraint. |
| table_schema | VARCHAR | The name of the schema that contains the table that contains the column that is used by the constraint. |
| table_name | VARCHAR | The name of the table that contains the column that is used by the constraint. |
| column_name | VARCHAR | The name of the column that is used by the constraint. |
| constraint_catalog | VARCHAR | The name of the database that contains the constraint. |
| constraint_schema | VARCHAR | The name of the schema that contains the constraint. |
| constraint_name | VARCHAR | The name of the constraint. |

## information_schema.data_types

The `data_types` view shows all data types in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| data_type | VARCHAR | Data type. |

## information_schema.databases

The `databases` view shows all databases where the current user has access.

| Column Name | Column Type | Column Description |
|---|---|---|
| database_name | VARCHAR | Name of the database. |
| created_at | TIMESTAMP | Timestamp that specifies when the database was created. |

## information_schema.geometry_columns

The `geometry_columns` view shows information about all geometry type columns in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| f_table_catalog | VARCHAR | Name of the database. |
| f_table_schema | VARCHAR | Name of the schema. |
| f_table_name | VARCHAR | Name of the table. |
| f_geometry_column | VARCHAR | Name of the column. |
| coord_dimension | INT | The coordinate dimension. |
| srid | INT | The ID of the spatial reference system. |
| type | VARCHAR | Data type of the column (POINT, LINESTRING, POLYGON, etc.). |

## information_schema.groups

The `groups` view shows all groups in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| database_name | VARCHAR | Name of the database. |
| group_name | VARCHAR | Name of the group. |

## information_schema.index_recommendations

This view contains index recommendations.

| Column Name | Column Type | Column Description |
|---|---|---|
| table_name | VARCHAR | Name of the table. |
| column_name | VARCHAR | Name of the column. |
| create_index_sql | VARCHAR | SQL statement to create the recommended index. |

## information_schema.indexes

The `indexes` view shows all indexes used in the system.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| table_catalog | VARCHAR | Name of the database. |
| table_schema | VARCHAR | Name of the schema. |
| table_name | VARCHAR | Name of the table. |
| index_name | VARCHAR | Name of the index. |
| index_type | VARCHAR | Type of the index. |
| column_name | VARCHAR | Name of the column. |

## information_schema.information_schema_catalog_name

The `information_schema_catalog_name` view shows the current database.

| Column Name | Column Type | Column Description |
|---|---|---|
| catalog_name | VARCHAR | Name of the database. |

## information_schema.key_column_usage

The `key_column_usage` view identifies all columns in the system that are restricted by a primary key, unique, or foreign key constraint, which follows the SQL standard `information_schema.key_column_usage` specification.

| Column Name | Column Type | Column Description |
|---|---|---|
| constraint_catalog | VARCHAR | The name of the database that contains the constraint. |
| constraint_schema | VARCHAR | The name of the schema that contains the constraint. |
| constraint_name | VARCHAR | The name of the constraint. |
| table_catalog | VARCHAR | The name of the database that contains the table that contains the restricted column. |
| table_schema | VARCHAR | The name of the schema that contains the table that contains the restricted column. |
| table_name | VARCHAR | The name of the table that contains the restricted column. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| column_name | VARCHAR | The name of the restricted column. |
| ordinal_position | INT | The ordinal position of the column within the constraint key. The position starts at 1. |
| position_in_unique_constraint | INT | For a foreign-key constraint, the ordinal position of the referenced column within its unique constraint. The position starts at 1. NULL for non-foreign-key constraints. |

## information_schema.mcp_tools

The `mcp_tools` view shows information for all Model Context Protocol (MCP) tools in the system, including user-defined and system tools.

| Column Name | Column Type | Column Description |
|---|---|---|
| tool_catalog | VARCHAR | Name of the database. |
| tool_schema | VARCHAR | Name of the schema. |
| tool_name | VARCHAR | Name of the MCP tool. |
| tool_type | VARCHAR | Type of the MCP tool with values: `MCP TOOL` for user-defined tools and `SYSTEM MCP TOOL` for system tools. |
| language | VARCHAR | Programming language of the MCP tool. |
| description | VARCHAR | Description of the MCP tool. |
| toolset | VARCHAR | Toolset where the MCP tool belongs. |
| created_at | TIMESTAMP | Timestamp that represents the MCP tool was created. This value is NULL for system tools. |
| creator_id | UUID | Universally Unique IDentifier (UUID) of the user who created the MCP tool. This value is NULL for system tools. |

## information_schema.node_storage

The `node_storage` view provides a unified per-node summary of storage metrics. The view combines physical device capacity and utilization from the `sys.storage_device_status` system catalog table with queryable (active) storage usage from the `sys.storage_used` system catalog table. The system deduplicates devices by serial number to avoid double-counting across roles.

| Column Name | Column Type | Column Description |
|---|---|---|
| node_name | VARCHAR | Name of the node. |
| total_capacity_bytes | BIGINT | Total physical device capacity, in bytes, summed across all deduplicated devices on the node. |
| physical_used_bytes | BIGINT | Physical storage used, in bytes, derived from device-level utilization metrics. |
| physical_used_percentage | DOUBLE | Ratio of physical storage used to total capacity (0.0 to 1.0). This value is NULL when total capacity is zero. |
| queryable_used_bytes | BIGINT | Storage used by active, queryable table data, in bytes. This value is 0 for nodes that do not participate in a Foundation cluster. |
| queryable_used_percentage | DOUBLE | Ratio of queryable storage used to total device capacity (0.0 to 1.0). This value is NULL when total capacity is zero. |
| active_devices | BIGINT | Number of storage devices with the ACTIVE status on the node. |
| failed_devices | BIGINT | Number of storage devices with the FAILED status on the node. |

## information_schema.nodes

The `nodes` view shows all nodes defined in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| name | VARCHAR | Name of the node. |
| service_role_types | VARCHAR[] | The type of service roles on this node. |
| operational_status | VARCHAR | The operational status of the node. Values are ACTIVE, STARTING, STOPPING, ERROR, UNKNOWN, or UNREACHABLE. |
| software_version | VARCHAR | Version of the software running on this node. |

## information_schema.parameters

The `parameters` view shows information for the parameters of all stored procedures in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| specific_catalog | VARCHAR | Name of the routine’s database. |
| specific_schema | VARCHAR | Name of the routine’s schema. |
| specific_name | VARCHAR | Name of the routine. |
| ordinal_position | INT | Ordinal position of the parameter. |
| parameter_mode | VARCHAR | IN or OUT. Only IN is supported. |
| is_result | BOOLEAN | True if the row represents the return result. The return result has ordinal 0 and its name and data type are NULL. |
| as_locator | BOOLEAN | Not implemented. Always false. |
| parameter_name | VARCHAR | Name of the parameter. NULL if and only if is_result is true. |
| from_sql_specific_catalog | NULL | Not implemented. Always NULL. |
| from_sql_specific_schema | NULL | Not implemented. Always NULL. |
| from_sql_specific_name | NULL | Not implemented. Always NULL. |
| to_sql_specific_catalog | NULL | Not implemented. Always NULL. |
| to_sql_specific_schema | NULL | Not implemented. Always NULL. |
| to_sql_specific_name | NULL | Not implemented. Always NULL. |
| data_type | VARCHAR | Data type of the parameter. NULL if and only if is_result is true. |
| character_maximum_length | NULL | Not implemented. Always NULL. |
| character_octet_length | NULL | Not implemented. Always NULL. |
| character_set_catalog | NULL | Database name of the character set. Always NULL. |
| character_set_schema | NULL | Schema name of the character set. Always NULL. |
| character_set_name | NULL | Name of the character set. Always NULL. |
| collation_catalog | NULL | Database name of the collation. Always NULL. |
| collation_schema | NULL | Schema name of the collation. Always NULL. |
| collation_name | NULL | Name of the collation. Always NULL. |
| numeric_precision | NULL | Precision of the parameter. Always NULL. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| numeric_precision_radix | NULL | Radix of the precision of the parameter. Always NULL. |
| numeric_scale | NULL | Scale of the parameter. Always NULL. |
| datetime_precision | NULL | Precision of a datetime of the parameter. Always NULL. |
| interval_type | NULL | Type of interval of the parameter. Always NULL. |
| interval_precision | NULL | Precision of interval of the parameter. Always NULL. |
| udt_catalog | NULL | Name of the udt database. Always NULL. |
| udt_schema | NULL | Name of the udt schema. Always NULL. |
| udt_name | NULL | Name of the udt. Always NULL. |
| scope_catalog | NULL | Name of the scope database. Always NULL. |
| scope_schema | NULL | Name of the scope schema. Always NULL. |
| scope_name | NULL | Name of the scope. Always NULL. |
| maximum_cardinality | NULL | Maximum cardinality of the result set from the routine, or NULL if not known. |
| dtd_identifier | NULL | Not implemented. Always NULL. |
| declared_data_type | NULL | Data type declared to be returned by the routine. Always NULL. |
| declared_numeric_precision | NULL | Precision declared to be of the parameter. Always NULL. |
| declared_numeric_scale | NULL | Numeric scale declared for the parameter. Always NULL. |
| parameter_default | NULL | Default value of the parameter. Always NULL because Ocient stored procedures do not have optional parameters. |

## information_schema.pipeline_status

To view dynamic information about the status of the pipeline, query from information_schema.pipeline_status, or you can use the SHOW PIPELINE_STATUS command.

| Column Name | Column Type | Column Description |
|---|---|---|
| database_name | VARCHAR | Name of the database where the pipeline was created. |
| pipeline_name | VARCHAR | The name of this pipeline. |
| table_names | VARCHAR[] | An array of fully-qualified table names where the pipeline loads data. |
| status | VARCHAR | Status of the pipeline (RUNNING, STOPPED, COMPLETED, FAILED, QUIESCING, QUIESCED). |
| status_message | VARCHAR | The corresponding event message of the last event that the Ocient System sees for this pipeline from the event_message column of the sys.pipeline_events system catalog table. |
| duration_seconds | INT | Duration, in seconds, of how long the pipeline has been running. |
| files_processed | BIGINT | The number of files that have been processed for file-based loads. (includes files with these statuses: LOADED, LOADED_WITH_ERRORS, and SKIPPED) |
| files_failed | BIGINT | The number of files that have failed and have a file status of FAILED for file-based loads. |
| files_remaining | BIGINT | The number of remaining files for file-based loads. (includes these file statuses: PENDING, QUEUED, and LOADING) |
| files_total | BIGINT | The total number of files for file-based loads. |
| fraction_complete | FLOAT | The estimated fraction completion as a value from 0.0 to 1.0 for file-based batch or transactional loads. The calculation is files processed or failed divided by the total files. |
| records_processed | BIGINT | The number of records that the pipeline has processed. The pipeline attempts to process and load a record. This number can be greater than the value of records_loaded due to the deduplication of records that the system processes twice or where record-level errors occur. |
| records_loaded | BIGINT | The number of records that have successfully loaded into the system. This number reflects the records in the system and does not include records that failed to load or were eliminated as duplicates. |
| records_failed | BIGINT | Number of records that have failed. |
| bytes_ingested | BIGINT | The total number of bytes of raw ingest data retrieved from the source. |

## information_schema.pipeline_status_historical

To view information about the status of dropped pipelines, query from information_schema.pipeline_status_historical. This system view is the historical equivalent of information_schema.pipeline_status.

| Column Name | Column Type | Column Description |
|---|---|---|
| database_name | VARCHAR | Name of the database where the pipeline was created. |
| pipeline_name | VARCHAR | The name of this pipeline. |
| status | VARCHAR | Status of the pipeline (RUNNING, STOPPED, COMPLETED, FAILED). |
| status_message | VARCHAR | The corresponding event message of the last event that the Ocient System sees for this pipeline from the `event_message` column of the `sys.pipeline_events` system catalog table. |
| duration_seconds | INT | Duration, in seconds, of how long the pipeline ran. |
| files_processed | BIGINT | The number of files that have been processed for file-based loads. (includes files with these statuses: LOADED, LOADED_WITH_ERRORS, and SKIPPED) |
| files_failed | BIGINT | The number of files that have failed and have a file status of FAILED for file-based loads. |
| files_remaining | BIGINT | The number of remaining files for file-based loads. (includes PENDING, QUEUED, and LOADING status files) |
| files_total | BIGINT | The total number of files for file-based loads. |
| fraction_complete | FLOAT | The estimated fraction completion as a value from 0.0 to 1.0 for file-based batch or transactional loads. The calculation is files processed or failed divided by the total files. |
| records_processed | BIGINT | The number of records that the pipeline has processed. |
| records_loaded | BIGINT | The number of records that have successfully loaded into the system. |
| records_failed | BIGINT | Number of records that have failed. |
| bytes_ingested | BIGINT | The total number of bytes of raw ingest data retrieved from the source. |
| pipeline_id | UUID | Universally Unique IDentifier (UUID) of the pipeline. |

Ocient Proprietary and Confidential

## information_schema.pipeline_table_metrics

To view dynamic information about the metrics specific to each of the target tables of the pipeline, query from the information_schema.pipeline_table_metrics view.

| Column Name | Column Type | Column Description |
|---|---|---|
| database_name | VARCHAR | The name of the database where the pipeline was created. |
| pipeline_name | VARCHAR | The name of this pipeline. |
| table_name | VARCHAR | The fully-qualified name of the table where the pipeline loads data. |
| records_processed | BIGINT | The number of records that the pipeline has processed for loading into the table. The pipeline attempts to process and load a record. This number can be greater than the value of the records_loaded column due to the deduplication of records that the system processes twice or where the record-level errors occur. |
| records_loaded | BIGINT | The number of records the Ocient System has successfully loaded into the table. This number reflects the records in the table and does not include records that the pipeline failed to load or eliminated as duplicates. |
| records_failed | BIGINT | The number of records the pipeline failed to load into the table. This number does not include records the pipeline failed to load to all tables, such as failed records during extraction. |
| processing_duration | BIGINT | Duration, in milliseconds, indicating how long the pipeline has been processing records for the table. |
| loading_duration | BIGINT | Duration, in milliseconds, indicating how long the pipeline has been loading records into the table. |
| bytes_flushed | BIGINT | The number of bytes that the system sent to the Loader Node to be made durable. |
| bytes_ingested | BIGINT | The total bytes of raw ingested data retrieved by the pipeline. |

## information_schema.pipelines

To view static information that stays the same after the pipeline has been created, query from information_schema.pipelines, or you can use the SHOW PIPELINES command. The columns in the information_schema.pipelines view derive from the underlying sys.pipelines system catalog table.

| Column Name | Column Type | Column Description |
|---|---|---|
| database_name | VARCHAR | Name of the database where the pipeline was created. |
| pipeline_name | VARCHAR | Name of the pipeline. |
| loading_mode | VARCHAR | Specifies whether the pipeline runs in a one-time (BATCH), one-time transactional (TRANSACTIONAL), or continuous (CONTINUOUS) way. |
| source_type | VARCHAR | Source of the data (S3, KAFKA, FILESYSTEM). |
| status | VARCHAR | Status of the pipeline (RUNNING, STOPPED, COMPLETED, FAILED, QUIESCING, QUIESCED). |
| data_format | VARCHAR | Structure of the data (DELIMITED, CSV, JSON, PARQUET). |
| table_names | VARCHAR[] | An array of fully-qualified table names where the pipeline loads data. |
| created_at | TIMESTAMP | Timestamp of when the pipeline was created. |
| altered_at | TIMESTAMP | Timestamp that indicates when the pipeline was last altered. |
| creator_id | UUID | Universally Unique IDentifier (UUID) of the creator of the pipeline. |
| transaction_id | UUID | The UUID of the transaction scope if this pipeline runs in a one-time transactional way. |

## information_schema.pipelines_historical

To view static information about pipelines that have been dropped from the system, query from the `information_schema.pipelines_historical` system view. This view is the historical equivalent of the `information_schema.pipelines` view.

| Column Name | Column Type | Column Description |
|---|---|---|
| database_name | VARCHAR | Name of the database where the pipeline was created. |
| pipeline_name | VARCHAR | The name of this pipeline. |
| loading_mode | VARCHAR | Specifies whether the pipeline runs in a one-time (BATCH), one-time transactional (TRANSACTIONAL), or continuous (CONTINUOUS) way. |
| source_type | VARCHAR | Source of the data (S3, KAFKA, FILESYSTEM). |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| status | VARCHAR | Status of the pipeline (RUNNING, STOPPED, COMPLETED, FAILED). |
| data_format | VARCHAR | Structure of the data (CSV, DELIMITED, JSON, BINARY, PARQUET, XML, ASN1, AVRO). |
| created_at | TIMESTAMP | Timestamp that indicates when this pipeline was created. |
| altered_at | TIMESTAMP | Timestamp that indicates when this pipeline was last updated. |
| creator_id | UUID | The Universally Unique IDentifier (UUID) of the user or group who created the pipeline (sys.users/sys.groups). |
| transaction_id | UUID | The UUID of the transaction scope if this pipeline runs in a one-time transactional way. |
| dropped_at | TIMESTAMP | Timestamp that indicates when the pipeline was dropped. |
| rolehostd_version | VARCHAR | The rolehostd version in which this pipeline was created. |
| pipeline_id | UUID | UUID of the pipeline. |

## information_schema.reserved_words

The `reserved_words` view shows all reserved words in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| reserved_word | VARCHAR | A word that is a reserved keyword for use by Ocient. |

## information_schema.routines

The `routines` view shows information for all stored procedures in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| specific_catalog | VARCHAR | Name of the specific database. |
| specific_schema | VARCHAR | Name of the specific schema. |
| specific_name | VARCHAR | Name of the specific routine. |
| routine_catalog | VARCHAR | Name of the routine database. |
| routine_schema | VARCHAR | Name of the routine schema. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| routine_name | VARCHAR | Name of the routine. |
| routine_type | VARCHAR | Type of the routine, either PROCEDURE or FUNCTION. |
| module_catalog | NULL | Name of the module database. Always NULL. |
| module_schema | NULL | Name of the module schema. Always NULL. |
| module_name | NULL | Name of the module. Always NULL. |
| udt_catalog | NULL | Name of the user-defined type (UDT) database. Always NULL. |
| udt_schema | NULL | Name of the UDT schema. Always NULL. |
| udt_name | NULL | Name of the UDT. Always NULL. |
| data_type | VARCHAR | Data type returned from the routine. |
| character_maximum_length | NULL | Not implemented. Always NULL. |
| character_octet_length | NULL | Not implemented. Always NULL. |
| character_set_catalog | NULL | Database name of the character set. Always NULL. |
| character_set_schema | NULL | Schema name of the character set. Always NULL. |
| character_set_name | NULL | Name of the character set. Always NULL. |
| collation_catalog | NULL | Database name of the collation. Always NULL. |
| collation_schema | NULL | Schema name of the collation. Always NULL. |
| collation_name | NULL | Name of the collation. Always NULL. |
| numeric_precision | NULL | Precision returned by the routine. Always NULL. |
| numeric_precision_radix | NULL | Radix of the precision returned by the routine. Always NULL. |
| numeric_scale | NULL | Scale returned by the routine. Always NULL. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| datetime_precision | NULL | Precision of a datetime returned by the routine. Always NULL. |
| interval_type | NULL | Type of interval returned by the routine. Always NULL. |
| interval_precision | NULL | Precision of interval returned by the routine. Always NULL. |
| type_udt_catalog | NULL | Name of the UDT type database. Always NULL. |
| type_udt_schema | NULL | Name of the UDT type schema. Always NULL. |
| type_udt_name | NULL | Name of the UDT type. Always NULL. |
| scope_catalog | NULL | Name of the scope database. Always NULL. |
| scope_schema | NULL | Name of the scope schema. Always NULL. |
| scope_name | NULL | Name of the scope. Always NULL. |
| maximum_cardinality | BIGINT | Maximum cardinality of the result set from the routine, or NULL if not known. |
| dtd_identifier | NULL | Not implemented. Always NULL. |
| routine_body | VARCHAR | Body of the routine (only for SQL-based routines). |
| routine_definition | NULL | Definition of the routine. Always NULL. |
| external_name | NULL | External name of the routine. Always NULL. |
| external_language | VARCHAR | Language in which the routine is written. |
| parameter_style | VARCHAR | Always ‘SQL’. |
| is_deterministic | NULL | If true, the output of the routine depends solely on its inputs. If NULL, the value is unknown. |
| sql_data_access | NULL | One of ‘CONTAINS SQL’, ‘NO SQL’, ‘READS SQL DATA’, or ‘MODIFIES SQL DATA’. Always NULL. |
| is_null_call | BOOLEAN | If true and if any of the arguments of the routine are NULL, then the routine |

| Column Name | Column Type | Column Description |
|---|---|---|
| | | is not called. |
| sql_path | NULL | Always NULL. |
| schema_level_routine | BOOLEAN | Always true. Indicates that the routine is a schema-level routine. |
| max_dynamic_result_sets | BIGINT | Either 0 (routine returns nothing or a scalar) or 1 (routine returns a result set), or NULL for a non-SQL stored procedure. |
| is_user_defined_cast | BOOLEAN | True if the routine is a user-defined cast (not supported at this time). |
| is_implicitly_invocable | BOOLEAN | True if the routine can be implicitly invoked (not supported at this time). |
| security_type | VARCHAR | Indicates whether the routine runs with the privileges of the user that defined it (‘DEFINER’) or the user that invoked it (‘INVOKER’). Only INVOKER is supported. |
| to_sql_specific_catalog | NULL | Not implemented. Always NULL. |
| to_sql_specific_schema | NULL | Not implemented. Always NULL. |
| to_sql_specific_name | NULL | Not implemented. Always NULL. |
| as_locator | NULL | Not implemented. Always NULL. |
| created | TIMESTAMP | Time the routine was created. |
| last_altered | TIMESTAMP | Time the routine was last modified. |
| new_savepoint_level | NULL | Not implemented. Always NULL. |
| is_udt_dependent | BOOLEAN | Not implemented. Always false. |
| result_cast_from_data_type | NULL | Not implemented. Always NULL. |
| result_cast_as_locator | NULL | Not implemented. Always NULL. |
| result_cast_char_max_length | NULL | Not implemented. Always NULL. |
| result_cast_char_octet_length | NULL | Not implemented. Always NULL. |
| result_cast_char_set_catalog | NULL | Database name of the character set of the result. Always NULL. |
| result_cast_char_set_schema | NULL | Schema name of the character set of the result. Always NULL. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
| --- | --- | --- |
| result_cast_char_set_name | NULL | Name of the character set of the result. Always NULL. |
| result_cast_collation_catalog | NULL | Database name of the collation of the result. Always NULL. |
| result_cast_collation_schema | NULL | Schema name of the collation of the result. Always NULL. |
| result_cast_collation_name | NULL | Name of the collation of the result. Always NULL. |
| result_cast_numeric_precision | NULL | Precision returned by the cast routine. Always NULL. |
| result_cast_numeric_precision_radix | NULL | Radix of the precision returned by the cast routine. Always NULL. |
| result_cast_numeric_scale | NULL | Scale returned by the cast routine. Always NULL. |
| result_cast_datetime_precision | NULL | Precision of a datetime returned by the cast routine. Always NULL. |
| result_cast_interval_type | NULL | Type of interval returned by the cast routine. Always NULL. |
| result_cast_interval_precision | NULL | Precision of interval returned by the cast routine. Always NULL. |
| result_cast_type_udt_catalog | NULL | Name of the UDT type database returned by the cast routine. Always NULL. |
| result_cast_type_udt_schema | NULL | Name of the udt type schema returned by the cast routine. Always NULL. |
| result_cast_type_udt_name | NULL | Name of the udt type returned by the cast routine. Always NULL. |
| result_cast_scope_catalog | NULL | Name of the scope database returned by the cast routine. Always NULL. |
| result_cast_scope_schema | NULL | Name of the scope schema returned by the cast routine. Always NULL. |
| result_cast_scope_name | NULL | Name of the scope returned by the cast routine. Always NULL. |
| result_cast_maximum_cardinality | NULL | Maximum cardinality of the result set from the cast routine. Always NULL. |
| result_cast_dtd_identifier | NULL | Not implemented. Always NULL. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| declared_data_type | NULL | Data type declared to be returned by the routine. Always NULL. |
| declared_numeric_precision | NULL | Precision declared to be returned by the routine. Always NULL. |
| declared_numeric_scale | NULL | Scale declared to be returned by the routine. Always NULL. |
| result_cast_from_declared_data_type | NULL | Not implemented. Always NULL. |
| result_cast_declared_numeric_precision | NULL | Not implemented. Always NULL. |
| result_cast_declared_numeric_scale | NULL | Not implemented. Always NULL. |

## information_schema.schemata

The `schemata` view shows information for all schemas in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| schema_name | VARCHAR | Name of the schema. |
| catalog_name | VARCHAR | Name of the database. |

## information_schema.table_constraints

The `table_constraints` view shows all constraints belonging to tables in the system, which follows the SQL standard `information_schema.table_constraints` specification.

| Column Name | Column Type | Column Description |
|---|---|---|
| constraint_catalog | VARCHAR | The name of the database that contains the constraint. |
| constraint_schema | VARCHAR | The name of the schema that contains the constraint. |
| constraint_name | VARCHAR | The name of the constraint. |
| table_catalog | VARCHAR | The name of the database that contains the table. |
| table_schema | VARCHAR | The name of the schema that contains the table. |
| table_name | VARCHAR | The name of the table. |
| constraint_type | VARCHAR | The type of the constraint with valid values: `PRIMARY_KEY`, `UNIQUE`, and `FOREIGN_KEY`. |

© 2026 Ocient, Inc

| Column Name | Column Type | Column Description |
|---|---|---|
| is_deferrable | BOOLEAN | Whether the database can defer the evaluation of the constraint. The default value is `false`. |
| initially_deferred | BOOLEAN | Whether the database can defer the evaluation of the constraint initially. The default value is `false`. |
| enforced | BOOLEAN | Whether the database enforces the constraint. The default value is `true`. |

## information_schema.table_privileges

The `table_privileges` view shows information for all table privileges in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| grantor | VARCHAR | The user who granted this privilege. |
| grantee | VARCHAR | The user who received this privilege. |
| table_catalog | VARCHAR | Name of the database. |
| table_schema | VARCHAR | Name of the schema. |
| table_name | VARCHAR | Name of the table. |
| privilege_type | VARCHAR | The privilege for the grant. |
| is_grantable | VARCHAR | Whether the user can grant this privilege to another user. |

## information_schema.table_storage

The `tables_storage` view shows information about the storage used by tables.

| Column Name | Column Type | Column Description |
|---|---|---|
| table_catalog | VARCHAR | Name of the database. |
| table_schema | VARCHAR | Name of the schema. |
| table_name | VARCHAR | Name of the table. |
| row_count | BIGINT | The number of rows in the table. |
| deleted_row_count | BIGINT | The number of deleted rows in the table. |
| segment_count | BIGINT | The number of segments that constitute the table. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| size | BIGINT | The size of the table in bytes. |

## information_schema.tables

The `tables` view shows information for all tables and views in the system, including user-defined and system objects.

| Column Name | Column Type | Column Description |
|---|---|---|
| table_catalog | VARCHAR | Name of the database. |
| table_schema | VARCHAR | Name of the schema. |
| table_name | VARCHAR | Name of the table. |
| table_type | VARCHAR | Type of the table. |
| is_insertable_into | VARCHAR | Whether an INSERT command can target this table. |
| created_at | TIMESTAMP | Timestamp that represents when the table was created. |
| creator_id | UUID | Universally Unique IDentifier (UUID) of the creator of the table. |

## information_schema.transactional_pipeline_status

To view information about the status of transactional pipelines (both active and dropped), query from information_schema.transactional_pipeline_status. This system view combines information_schema.pipeline_status and information_schema.pipeline_status_historical, filtered to pipelines with a non-NULL `transaction_id` column.

| Column Name | Column Type | Column Description |
|---|---|---|
| transaction_id | UUID | The Universally Unique IDentifier (UUID) of the transaction scope for this pipeline. |
| database_name | VARCHAR | Name of the database where the pipeline was created. |
| pipeline_name | VARCHAR | The name of this pipeline. |
| table_names | VARCHAR[] | An array of fully-qualified table names where the pipeline loads data. This value is NULL for dropped pipelines. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Column Name | Column Type | Column Description |
|---|---|---|
| status | VARCHAR | Status of the pipeline (RUNNING, STOPPED, COMPLETED, FAILED). |
| status_message | VARCHAR | The corresponding event message of the last event that the Ocient System sees for this pipeline from the `event_message` column of the `sys.pipeline_events` system catalog table. |
| duration_seconds | INT | Duration, in seconds, of how long the pipeline has been running. |
| files_processed | BIGINT | The number of files that have been processed for file-based loads. (includes files with these statuses: LOADED, LOADED_WITH_ERRORS, and SKIPPED) |
| files_failed | BIGINT | The number of files that have failed and have a file status of FAILED for file-based loads. |
| files_remaining | BIGINT | The number of remaining files for file-based loads. (includes PENDING, QUEUED, and LOADING status files) |
| files_total | BIGINT | The total number of files for file-based loads. |
| fraction_complete | FLOAT | The estimated fraction completion as a value from 0.0 to 1.0 for file-based batch or transactional loads. The calculation is files processed or failed divided by the total files. |
| records_processed | BIGINT | The number of records that the pipeline has processed. |
| records_loaded | BIGINT | The number of records that have successfully loaded into the system. |
| records_failed | BIGINT | Number of records that have failed. |
| bytes_ingested | BIGINT | The total number of bytes of raw ingest data retrieved from the source. |
| pipeline_id | UUID | UUID of the pipeline. |

## information_schema.users

The `users` view shows all users in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| database_name | VARCHAR | Name of the database. |
| user_name | VARCHAR | Username of the user. |

### information_schema.views

The `views` view shows information for all user-defined and system views in the system.

| Column Name | Column Type | Column Description |
|---|---|---|
| table_catalog | VARCHAR | Name of the database. |
| table_schema | VARCHAR | Name of the schema. |
| table_name | VARCHAR | Name of the table. |
| view_definition | VARCHAR | Query used to generate the view content. |
| created_at | TIMESTAMP | Timestamp that represents the date and time for the creation of the view. |
| updated_at | TIMESTAMP | Timestamp that represents the date and time for the last update of the view. |
| creator_id | UUID | Universally Unique IDentifier (UUID) of the creator of the view. |

## SHOW Commands

The `SHOW` commands are additional commands you can use to retrieve metadata about the system. These commands are tightly coupled with the `information_schema` schema and offer a more user-friendly syntax alternative. Sometimes, unlike their `information_schema` counterparts, `SHOW` commands only return user-defined objects.

| SHOW Command | Description |
|---|---|
| SHOW COLUMNS | This statement returns columns from user-defined tables and views where the current user has access. |
| SHOW DATA_TYPES | This statement returns all data types in the system. |
| SHOW DATABASES | This statement returns all databases where the current user has access. |
| SHOW GEOMETRY_COLUMNS | This statement returns all geometry type columns where the current user has access. |
| SHOW GROUPS | This statement returns all groups in the system where the current user has read access. |
| SHOW INDEXES | This statement returns all indexes on user-defined tables where the current user has access. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| SHOW Command | Description |
| --- | --- |
| SHOW NODES | This statement returns all nodes in the system where the current user has read access. |
| SHOW PIPELINE_STATUS | This statement returns the status of all pipelines in the system where the current user has read access. |
| SHOW PIPELINES | This statement returns all pipelines in the system where the current user has read access. |
| SHOW RESERVED_WORDS | This statement returns all reserved words in the system. |
| SHOW SCHEMATA | This statement returns all user-defined schemas where the current user has access. |
| SHOW SYSTEM TABLES | This statement returns all system tables in the `sys` or `information_schema` schemas. |
| SHOW TABLE_PRIVILEGES | This statement returns all table privileges for tables where the current user has access. |
| SHOW TABLES | This statement returns all user-defined tables where the current user has access. |
| SHOW USERS | This statement returns all users in the system where the current user has read access. |
| SHOW VIEWS | This statement returns all user-defined views where the current user has access. |

# Discover Insights From System Catalog Tables

Sample SQL queries on Ocient system catalog tables to track storage use, node status, running queries, segment sizes, and other operational metrics.

You can query the Ocient® System catalog tables to discover important information on system objects such as databases, segments, tables, and indexes. These statistics can be important for monitoring your system to ensure it operates as intended.

However, querying these tables can be challenging because generating insights about your system can involve writing complex queries that involve merging, grouping, and filtering multiple system catalog tables.

Here, you can find examples of useful queries that you can use as templates for discovering insights about your system.

> Many of the metrics on this page are also available in the **Ocient Management UI**, which provides a visual interface for monitoring queries, databases, storage, and node health without writing SQL.

> Most of these example queries use the `data_type_coverage` table available with the Ocient Simulator. For details, see **Ocient Simulator**.

## Segment System Catalog Tables

For specific column definitions of the system catalog tables referenced in these examples, see the **Storage** section of the System Catalog page.

> The Management UI **Storage** page displays segment counts, table sizes, and storage space utilization without SQL queries. The Analysis tab breaks this down further by table and by TimeKey® segment.

### Segment Size

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

Check the size of segments and return insights about the segment storage allocation and the number of table rows contained in each segment.

SQL

```
SELECT current_timestamp,
    sg.segment_type,
    t.name,
    (COUNT(*)) AS num_segments,
    (SUM(s.row_count)) AS total_rows,
    (AVG(s.row_count)) AS avg_rows_per_segment,
    (DOUBLE(SUM(s.segment_size)) / 1000000000) AS total_size_gb,
    (MAX(s.segment_size / 1000000)) AS max_size,
    (MIN(s.segment_size / 1000000)) AS min_size,
    (AVG(s.segment_size) / 1000000) AS avg_size_mb,
    (STDEV(DOUBLE(s.segment_size) / 1000000)) AS stdev_size_mb
FROM
    sys.segment_groups AS sg
    JOIN sys.tables t ON t.id = sg.table_id
    JOIN sys.segments s ON s.segment_group_id = sg.id
GROUP BY
    sg.segment_type, t.name
ORDER BY
    total_size_gb DESC,
    total_rows DESC,
    sg.segment_type,
    t.name;
```

*Output*

Text

```
|  "current_timestamp()"  | "segment_type" |       "name"       | "num_segments"
|-------------------------|----------------|--------------------|----------------
| 2024-07-31 16:23:22.863 | TKT_SEGMENT    | data_type_coverage |              3
```

For information on the system catalog tables queried in this example, see **sys.segments** and **sys.tables**.

## Page and Segment Information

Check the details for pages and segments in the system.

SQL

```
WITH cte AS (
SELECT
    COALESCE(v.schema, t.schema) AS schema,
    COALESCE(v.name, t.name) AS name,
    stored_segments.status,
    stored_segments.kind,
    SUM(CASE WHEN segments.segment_type = 'PAGE' THEN 1 ELSE 0 END) AS pagecount,
    SUM(CASE WHEN segments.segment_type = 'TKT_SEGMENT' THEN 1 ELSE 0 END) AS seg
    SUM(CASE WHEN segments.segment_type = 'PAGE' THEN segments.row_count ELSE 0 EI
    SUM(CASE WHEN segments.segment_type = 'TKT_SEGMENT' THEN segments.row_count EI
    MIN(CASE WHEN segments.segment_type = 'PAGE' THEN sg.begin_time ELSE NULL END)
    MAX(CASE WHEN segments.segment_type = 'PAGE' THEN sg.end_time ELSE NULL END) A
    MIN(CASE WHEN segments.segment_type = 'TKT_SEGMENT' THEN sg.begin_time ELSE NU
    MAX(CASE WHEN segments.segment_type = 'TKT_SEGMENT' THEN sg.end_time ELSE NULI
FROM
    sys.segments
JOIN sys.stored_segments ON
    segments.segment_group_id = stored_segments.segment_group_id
    AND segments.ida_offset = stored_segments.ida_offset
JOIN sys.segment_groups sg ON
    sg.id = segments.segment_group_id
JOIN sys.tables AS t ON
    t.id = sg.table_id
LEFT JOIN sys.views AS v ON

```

# Query Management System Catalog Tables

For specific column definitions of the system catalog tables referenced in these examples, see the **Monitoring** section of the System Catalog page.

> The Management UI **Queries** page displays running and completed queries with filtering by status, user, service class, and execution time.

## Running Queries

Check all queries currently running on the system.

The output of the `sys.queries` table depends on what database you are logged into and your system role. For details, see **Query Visibility**.

SQL

```
SELECT
    queries.query_id,
    queries.initial_priority,
    queries.effective_priority,
    queries.user,
    queries.total_time,
    queries.status,
    queries.rows_returned,
    queries.bytes_returned
FROM
    sys.queries
WHERE
    queries.sql NOT LIKE '%sys.queries%';

SELECT
    q.query_id,
    q.user,
    q.sql,
    q.status,
    "database_name",
    q.bytes_returned
FROM
    sys.queries q;
```

*Output*

```text
|               "query_id"                |    "user"    |      "sql"       | "sta
|-----------------------------------------|--------------|------------------|-----
| "66b27dde-17df-403a-82d7-65e34b6fd07f" | admin@system |  "example_query" | RUNN
```

## Recent Queries

Check the most recent queries completed by the system.

The output of the `sys.completed_queries` table depends on what database you are logged into and your system role. For details, see **Query Visibility**.

```sql
SELECT user,
    timestamp_start,
    total_time,
    state,
    reason,
    sql
FROM sys.completed_queries
ORDER BY timestamp_start DESC
LIMIT 10;
```

*Output*

Text

# Database and Table System Catalog Tables

For specific column definitions of the system catalog tables used in these examples, see the **Databases** section of the System Catalog page.

> The Management UI **Databases** page shows database sizes, table counts, row counts, and compression ratios. Select a database to view its schemas, select a schema to view its tables, and select a table to view its columns, indexes, and constraints.

## Database Sizes

Check the total size of all databases on your system.

SQL

```sql
SELECT TO_CHAR(SUM(sp.size), '999,999,999,999,999') AS totsize,
    d.name
    FROM sys.segment_parts AS sp
    JOIN sys.segment_groups AS sg
        ON sp.segment_group_id = sg.id
    JOIN sys.tables AS t
        ON sg.table_id = t.id
    JOIN sys.databases AS d
        ON t.database_id = d.id
 GROUP BY d.name
 ORDER BY 1 DESC;
```

*Output*

Text

```
| "totsize" | "name" |
|-----------|--------|
| 204276004 | test   |
```

## Table Sizes

Check the total size of all tables on the system.

SQL

```sql
WITH
cte AS (
    SELECT
        sg.id AS segment_group_id,
        sp.name AS segment_name,
        sp.part_type AS partition_type,
        sp.size AS segment_size,
        sg.segment_type,
        sg.status,
        t.schema,
        t.name
    FROM sys.segment_parts AS sp
    INNER JOIN sys.segment_groups AS sg ON
        sp.segment_group_id = sg.id
    INNER JOIN sys.tables AS t ON
        sg.table_id = t.id ),
ctefinal AS (
    SELECT schema, name, SUM(segment_size) AS total_table_size
    FROM cte
    GROUP BY schema, name )
SELECT SCHEMA, name, total_table_size, SUM(total_table_size)
    OVER( ORDER BY total_table_size DESC ) AS running_total
    FROM ctefinal
    ORDER BY total_table_size DESC;
```

*Output*

Text

```
| "schema" |       "name"       | "total_table_size" | "running_total" |
|----------|--------------------|--------------------|-----------------|
| loading  | data_type_coverage |          204276004 |       204276004 |
```

## Table Statistics

This query provides a breakdown of table statistics and partition information.

SQL

```
WITH
cte1 AS (
    SELECT
        sg.id AS segment_group_id,
        sp.name AS segment_name,
        sp.part_type AS partition_type,
        sp.size AS segment_size,
        sg.segment_type,
        sg.status,
        t.schema,
        t.name
    FROM sys.segment_parts AS sp
    INNER JOIN sys.segment_groups AS sg ON
        sp.segment_group_id = sg.id
    INNER JOIN sys.tables AS t ON
        sg.table_id = t.id ),
cte AS (
    SELECT
        COUNT(*) AS num_segments,
        SUM(segment_size) AS partition_size,
        partition_type,
        SUM(SUM(segment_size)) OVER(PARTITION BY schema, name) AS total_table_size
        SUM(COUNT(*)) OVER(PARTITION BY schema, name) AS total_table_segments,
        schema,
        name
    FROM cte1
    GROUP BY
        partition_type,
        schema,
        name )
SELECT
    name,
    num_segments,
    partition_size,
    partition_type,
    CAST(FLOAT(partition_size)/(total_table_size + 1) * 100
        AS DECIMAL(6,3)) AS percent_of_total,

```

For information on the system catalog tables queried in this example, see **sys.segment_groups** and **sys.segment_parts**.

## Compression

Check the information on the compression for each column in the specified table.

SQL

```
SELECT r."table",
    c.NAME,
    r.is_rle_enabled,
    r.is_ne_enabled,
    r.raw_size,
    r.compressed_size,
    r.is_deltadelta_enabled,
    r.num_deltadelta_blocks,
    r.num_rle_blocks,
    r.num_nerle_blocks,
    r.num_uncompressed_blocks,
    r.num_total_blocks
FROM sys.columns c,
    ( SELECT t.name AS "table",
        t.id,
        cci.is_deltadelta_enabled,
        cci.is_rle_enabled,
        cci.is_ne_enabled,
        cci.raw_size,
        cci.compressed_size,
        cci.num_deltadelta_blocks,
        cci.num_rle_blocks,
        cci.num_nerle_blocks,
        cci.num_uncompressed_blocks,
        cci.num_total_blocks,
        cci.ordinal
        FROM sys.tables AS t,
            sys.columns_compression_info AS cci
        WHERE t.id = cci.table_id
            AND t.name = 'my_table' ) AS r
WHERE r.id = c.table_id
    AND r.ordinal = c.ordinal;
```

*Output*

```

For information on the system catalog table queried in this example, see **sys.columns_compression_info**.

## Compression for the Entire Table

This query summarizes the total compression of the specified table. In the example, replace the table name and schema name accordingly.

© 2026 Ocient, Inc

SQL

```
SELECT SUM(raw_size),
    SUM(compressed_size)
FROM (
    SELECT t.name,
        c.name AS colname,
        co.raw_size,
        co.compressed_size,
        SUM(co.compressed_size) OVER(PARTITION BY t.schema, t.name) AS table_size
        100 -((100 * co.compressed_size) / co.raw_size) AS col_compress_percent,
        DECIMAL(
           FLOAT(co.compressed_size) * 100 / SUM(co.compressed_size)
           OVER(PARTITION BY t.schema, t.name),
           3,
           1
           ) AS percent_of_table
    FROM (
        SELECT table_id,
            ordinal,
            raw_size,
            compressed_size
        FROM sys.columns_compression_info
        UNION ALL
        SELECT table_id,
            ordinal,
            raw_size,
            compressed_size
        FROM sys.vl_columns_compression_info
      ) AS co
    JOIN sys.tables AS t ON co.table_id = t.id
    JOIN sys.columns AS c ON c.table_id = t.id
        AND co.ordinal = c.ordinal
    WHERE t.name = 'data_type_coverage'
        AND t.schema = 'loading'
    ORDER BY co.ordinal
    ) AS abc;
```

*Output*

Text

```
| "sum(raw_size)" | "sum(compressed_size)" |
|-----------------|------------------------|
|        73788914 |               73592306 |
```

For information on the system catalog table queried in this example, see **sys.columns_compression_info**.

## Index Size

Check the total size of each index across the different segment groups.

In this example, the table has three secondary indexes added before loading data.

SQL

```
SELECT p.name AS uuid,
    p.part_type,
    i.name AS index_name,
    SUM(p.size) AS sum_size
FROM (
    SELECT *
    FROM sys.segment_parts
    WHERE part_type LIKE 'index'
    ) AS p
    INNER JOIN sys.indexes i ON p.name = i.id
GROUP BY 1,2,3
ORDER BY 1,2;
```

*Output*

Text

```
|                 "uuid"                 | "part_type"  | "index_name" | "sum_size
|----------------------------------------|--------------|--------------|----------
| "669cbcdf-772f-4c97-b250-0cc9e573cd7b" | index        | idx01        |    252723
| cccf6f5e-96a8-4621-b947-f318d120f6a0   | index        | idx03        |     18022
| d75ae71a-207e-4723-a86c-ecffc798c7d0   | index        | idx02        |    319078
```

For information on the system catalog tables queried in this example, see **sys.indexes** and **sys.segment_parts**.

## Column Sizes

This query finds the size of all columns for the specified table. Before running this query on your system, replace `table_name` in the example.

SQL

```
WITH cte AS (
    SELECT
        table_id,
        ordinal,
        compressed_size
    FROM
        sys.columns_compression_info
    UNION ALL
    SELECT
        table_id,
        ordinal,
        compressed_size
    FROM
        sys.vl_columns_compression_info )
SELECT
    ( SELECT t.name
        FROM sys.tables AS t
        WHERE t.id = cte.table_id ) AS table_name,
    ordinal,
    compressed_size,
    ( SELECT name
        FROM sys.columns AS c
        WHERE c.table_id = cte.table_id
            AND c.ordinal = cte.ordinal ) AS name,
    DOUBLE(compressed_size) / SUM(compressed_size) OVER() AS percent_of_total
FROM cte
WHERE
    table_id IN (
        SELECT id
        FROM sys.tables
        WHERE name LIKE 'table_name' )
ORDER BY compressed_size;
```

*Output*

Text

```
|    "table_name"    | "ordinal" | "compressed_size" |     "name"     |  "percent_
|--------------------|-----------|-------------------|----------------|-----------
| data_type_coverage |        25 |              8192 |                |    0.0001(

```

This output is based on a query using the table `data_type_coverage`.

## Column Cardinality

This query finds the cardinality of each column in the specified table. Knowing the cardinality is useful for determining which compression scheme to use for a column.

SQL

```sql
SELECT t.schema,
    t.name,
    c.name,
    c.ordinal,
    cc.cardinality
FROM sys.column_cardinalities AS cc
    LEFT JOIN sys.tables AS t ON cc.table_id = t.id
    LEFT JOIN sys.columns AS c ON cc.column_id = c.id
WHERE t.name LIKE 'data_type_coverage'
ORDER BY c.ordinal;
```

*Output*

Text

```
| "schema" |       "name"       |    "name_1"    | "ordinal" | "cardinality" |

```

For information on the system catalog table queried in this example, see **sys.column_cardinalities**.

## Cluster and Node System Catalog Tables

For specific column definitions of the system catalog tables referenced in these examples, see the **System** section of the System Catalog page.

The Management UI **Nodes** page shows health, status, type, storage utilization, uptime, and software version for every node in the system. Select a node (from this page or from the **Ocient Dashboard** page) to view its details and configuration.

## Nodes Present on a System

Check the status of all nodes in the system.

SQL

```sql
SELECT name,
    status
FROM sys.nodes;
```

*Output*

Text

```
|   "name"    | "status" |
|-------------|----------|
| foundation2 | ACCEPTED |
| sql         | ACCEPTED |
| loader      | ACCEPTED |
| foundation1 | ACCEPTED |
| foundation0 | ACCEPTED |
```

## Nodes Roles on a System

Check the roles of each node in the system.

SQL

```sql
SELECT
    n.name, n.status,
    STRING_AGG(DISTINCT c.name, ', ' ORDER BY c.name) in_clusters,
    STRING_AGG(DISTINCT sr.service_role_type, ', ' ORDER BY sr.service_role_type)
FROM
    sys.nodes n
    LEFT JOIN sys.node_clusters nc ON nc.node_id = n.id
    LEFT JOIN sys.clusters c ON c.id = nc.cluster_id
    LEFT JOIN sys.service_roles sr ON sr.node_id = n.id
GROUP BY
    n.name, n.status
ORDER BY
    n.name;
```

*Output*

Text

```
|   "name"    | "status" |    "in_clusters"    |      "with_roles"       |
|-------------|----------|---------------------|-------------------------|-------
| foundation0 | ACCEPTED | "foundation_cluster |  foundation_cluster-vm" | "healtl
| foundation1 | ACCEPTED | "foundation_cluster |  foundation_cluster-vm" | "healtl
| foundation2 | ACCEPTED | "foundation_cluster |  foundation_cluster-vm" | "healtl
| loader      | ACCEPTED |                     | "health                 |  strear
| sql         | ACCEPTED | initial-vm          | "admin                  |  healtl
```

## Node Status

Check the operational status, software versions, and assigned roles of your nodes. Possible status values include `ACTIVE`, `STARTING`, `STOPPING`, `ERROR`, `UNKNOWN`, or `UNREACHABLE`.

SQL

```
SELECT name,
    operational_status,
    software_version,
    ARRAY_AGG(service_role_type)
FROM sys.node_status AS ns
    LEFT JOIN sys.nodes AS n ON ns.node_id = id
    LEFT JOIN sys.service_roles AS sr ON sr.node_id = n.id
GROUP BY name,
    operational_status,
    software_version;
```

*Output*

Text

```
|    name     | operational_status | software_version | array_agg(service_role_ty|
|-------------|--------------------|------------------|--------------------------
| loader      | Active             |           24.0.0 | ['health','streamloader']
| foundation2 | Active             |           24.0.0 | ['health','lts','operator
```

## Foundation Nodes on a Specific Cluster

Check for all Foundation Nodes on your system clusters.

SQL

```
SELECT n.name,
    r.name
FROM sys.nodes AS n,
    ( SELECT *
        FROM sys.clusters AS c,
            sys.node_clusters AS nc
        WHERE c.cluster_type = 'Foundation'
            AND c.id = nc.cluster_id ) AS r
WHERE r.node_id = n.id;
```

*Output*

Text

```
| foundation2 | foundation_cluster |
|-------------|--------------------|
| foundation0 | foundation_cluster |
| foundation1 | foundation_cluster |
```

## Drive Status

Check the status of all drives assigned to nodes in the system.

SQL

```sql
SELECT
    n.name AS node_name,
    s.node_id,
    s.id AS serial_number,
    s.pci_address,
    s.device_status,
    s.device_model
FROM
    sys.nodes AS n
JOIN sys.storage_device_status AS s
    ON n.id = s.node_id;
```

*Output*

Text

```
| "node_name" |               "node_id"                |            "serial_numbe
|-------------|----------------------------------------|-------------------------
| foundation1 | "6a96b307-57bc-477f-952c-e6cab38a7922" | "72062649-396c-4424-9da5

```

# Roles, Privileges, and Service Class System Catalog Tables

For specific column definitions of the system catalog tables referenced in these examples, see the **User Management** section of the System Catalog page.

## Group Assignment for Users

Check for all users on the system and their corresponding assigned group.

SQL

```sql
SELECT g.name AS group_name,
    r.user_name
FROM sys.groups AS g,
    ( SELECT u.user_name,
        ug.group_id
        FROM sys.users AS u,
            sys.user_groups AS ug
        WHERE u.id = ug.user_id ) AS r
ORDER BY g.name ASC;
```

*Output*

Text

```
| group_name | user_name |
|------------|-----------|
| DBA        | Humphrey  |
```

## User Roles

Check for all users on the system and their assigned role.

SQL

```sql
SELECT rl.name AS role_name,
    r.user_name
FROM sys.roles AS rl,
    ( SELECT u.user_name,
        ur.role_id
        FROM sys.users AS u,
            sys.user_roles AS ur
        WHERE u.id = ur.user_id ) AS r
ORDER BY rl.name ASC;
```

*Output*

Text

```
|       role_name         | user_name |
|-------------------------|-----------|
| system administrator    | Humphrey  |
| system analyst          | Grimey    |
| database administrator | Charles   |
| database analyst        | Edna      |
```

## User Privileges

Check the privileges for the specific table name. Before running on your system, replace `username` in the example.

SQL

```
SELECT t.schema AS db_name,
    t.name AS table_name,
    r.privilege
FROM sys.tables AS t,
    ( SELECT object_type,
        object_id,
        privilege
        FROM sys.PRIVILEGES
        WHERE grantee = 'username' ) AS r
WHERE r.object_id = t.id
ORDER BY t.schema, t.name ASC;
```

*Output*

Text

```
|  db_name |     table_name     |  privilege  |
|----------|--------------------|-------------|
| loading  | data_type_coverage | VIEW        |
| loading  | data_type_coverage | SELECT      |
```

## Privileges for the Specific Table

Check the granted privileges across all database objects of the specific type, such as `GROUP`, `TABLE`, or `DATABASE`. In this example, the query checks for `TABLE` privileges.

SQL

```
SELECT p.grantee,
    t.schema,
    t.name,
    p.privilege
FROM sys.tables AS t,
    sys.privileges AS p
WHERE object_type = 'TABLE'
    AND p.object_id = t.id;
```

*Output*

Text

```
| admin@system | admin@system |   example_table    | DELETE  |
|--------------|--------------|--------------------|---------|
| admin@system | admin@system | example_table      | DROP    |
| admin@system | admin@system | example_table      | SYSAUTH |
| admin@system | admin@system | example_table      | LOAD    |
| admin@system | admin@system | example_table      | INSERT  |
| admin@system | admin@system | example_table      | ALTER   |
| admin@system | admin@system | example_table      | SELECT  |
| admin@system | admin@system | example_table      | VIEW    |
```

## Groups Assigned to Service Classes

Check for the service class assignment for all groups.

SQL

```sql
SELECT g.name,
    sc.name
FROM sys.groups AS g,
    sys.service_classes AS sc
WHERE g.service_class_id = sc.id;
```

*Output*

Text

```
|  group  |    sc_name    |
|---------|---------------|
| analyst | high_priority |
| dbadmin | low_priority  |
```

## Service Class Settings

Check for the settings for the specified service class. Before running on your system, replace the `high priority` service class name in the example.

For details about service class settings, see **Workload Management and Service Classes**.

SQL

```
SELECT *
FROM sys.groups AS g,
    sys.service_classes AS sc
WHERE g.service_class_id = sc.id
    AND sc.name = 'high_priority';
```

*Output*

Text

```
| id                                   | name    | database_id
|--------------------------------------|---------|-------------------------------
| e9c92a1b-32a8-4f88-ab72-485ff8b24f53 | analyst | e80010d7-6f26-438c-8461-11af30
```

## Service Classes for the Specific User

Check for the service class of the specific user. Before running on your system, replace the `jmack@test` username in this example with the specific username that you want to query.

SQL

```
SELECT r2.name,
    sc.name,
    r2.user_name
FROM sys.service_classes AS sc,
    ( SELECT g.name,
        g.service_class_id,
        r.user_name
        FROM sys.groups AS g,
            ( SELECT u.user_name,
                ug.group_id
                FROM sys.users AS u,
                    sys.user_groups AS ug
                WHERE u.id = ug.user_id
                    AND u.user_name = 'jmack@test' ) AS r ) AS r2;
```

*Output*

Text

```
|  group  |  service_class  |  user_name  |
|---------|-----------------|-------------|
| analyst | Default         | jmack@test  |
| analyst | high_priority   | jmack@test  |
```

# Data Pipelines

## Pipeline Events

While your pipeline is running, the pipeline generates events in the `sys.pipeline_events` system catalog table to mark significant checkpoints when something has occurred. In this example, you execute the `CREATE PIPELINE` and `START PIPELINE` SQL statements on the pipeline named `my_pipeline` and let the pipeline complete. As expected, the `CREATED`, `STARTED`, and `COMPLETED` events appear. For details about the lists of files, see the `sys.pipeline_files` system catalog table.

Pipeline events include messages from many different tasks. These events are the background processes that execute across different Loader Nodes during pipeline

operation. For details about tasks, you can query the `sys.tasks` and `sys.subtasks` system catalog tables.

```
SQL

SELECT *
FROM sys.pipeline_events
ORDER BY event_timestamp;
```

*Output*

```
SQL

+--------------------------------------+--------------------------------------+---
| pipeline_id                          | task_id                              | us
|--------------------------------------+--------------------------------------+---
| d8848467-9262-4bd6-84a7-1380c95f8b8b |                                      | do
| d8848467-9262-4bd6-84a7-1380c95f8b8b |                                      | do
| d8848467-9262-4bd6-84a7-1380c95f8b8b |                                      |
| d8848467-9262-4bd6-84a7-1380c95f8b8b |                                      |
| d8848467-9262-4bd6-84a7-1380c95f8b8b | 61007c85-6744-42e7-9401-66e1a594e990 |

## Pipeline Metrics

Find metrics that measure the performance and activity of a pipeline in the `sys.pipeline_metrics` system catalog table. This table contains one row for each metric at a specified point in time. A common use of this data is to plot metric values over time to examine the behavior of a pipeline.

### Metric Types

Metrics are either instantaneous or incremental:

- Instantaneous metrics reflect the current value of a counter at the time of the metric collection. These values can increase or decrease based on the current state or rate of the metric.

- Incremental metrics increment over time and reflect the cumulative value for a specified counter.

### Example

The first snapshot of a metric appears when it is initialized. Afterward, the metric is updated every 10 seconds. The `updated_at` column shows the metric collection time.

For example, if you are interested in the number of bytes of raw source data that the pipeline has ingested, you can execute this query. The value increases over time as the pipeline runs.

SQL

```sql
SELECT *
FROM sys.pipeline_metrics
WHERE name = 'count.source.bytes.ingested'
ORDER BY updated_at;
```

*Output*

SQL

```
+--------------------------------------+--------------------------------------+---
| pipeline_id                          | extractor_task_id                    | pa
|--------------------------------------+--------------------------------------+---
| 0f51f1c0-f251-4407-8393-0f9bcbf18f28 | 034cf49d-364b-42b5-ad0a-37b7c237f16e |
| 0f51f1c0-f251-4407-8393-0f9bcbf18f28 | 034cf49d-364b-42b5-ad0a-37b7c237f16e |
| 0f51f1c0-f251-4407-8393-0f9bcbf18f28 | 034cf49d-364b-42b5-ad0a-37b7c237f16e |
| 0f51f1c0-f251-4407-8393-0f9bcbf18f28 | 034cf49d-364b-42b5-ad0a-37b7c237f16e |
| 0f51f1c0-f251-4407-8393-0f9bcbf18f28 | 034cf49d-364b-42b5-ad0a-37b7c237f16e |
+--------------------------------------+--------------------------------------+---
Fetched 5 rows
```

### Metric Scope

Each metric has a scope that defines its uniqueness. Be careful not to aggregate metrics across different scopes.

The scope columns are `pipeline_id`, `extractor_task_id`, `partition_id`, and `sink_index`. If the value of any of these columns is NULL, the scope applies to all values in that dimension.

For example, because the `sink_index` column is NULL for the metric `count.source.bytes.ingested`, the metric applies to the pipeline and file specified by the `pipeline_id`, `extractor_task_id`, `partition_id`, and `file_index` columns across all sinks.

An `extractor_task_id` is the internal identifier used when the Ocient System executes a pipeline process on a Loader Node. A pipeline might have many of these processes across time and loaders.

**Example**

Retrieve the most recent snapshot for each metric and aggregate the values to produce a single value for a pipeline.

SQL

```
SELECT pipeline_id, name, SUM(most_recent_value) AS total_value
FROM (
    SELECT DISTINCT * FROM (
        SELECT pipeline_id, extractor_task_id, partition_id, name,
        first_value (value) OVER
            (PARTITION BY pipeline_id, extractor_task_id, partition_id, name
             ORDER BY updated_at DESC) AS most_recent_value
        FROM sys.pipeline_metrics
        WHERE name LIKE 'count%'
    )
)
GROUP BY pipeline_id, name;
```

*Output*

SQL

```
+--------------------------------------+--------------------------------+--------
| pipeline_id                          | name                           |   total_
|--------------------------------------+--------------------------------+--------
| 0c7b32f1-37ca-43f7-96b6-69c266c978a5 | count.file.total               |
| 0c7b32f1-37ca-43f7-96b6-69c266c978a5 | count.source.bytes.ingested    |      33(
| 0c7b32f1-37ca-43f7-96b6-69c266c978a5 | count.file.processed           |
| 0c7b32f1-37ca-43f7-96b6-69c266c978a5 | count.record.sent              |        1
| 0c7b32f1-37ca-43f7-96b6-69c266c978a5 | count.record.durable           |        1
+--------------------------------------+--------------------------------+--------
Fetched 5 rows
```

This output contains a single row for each metric for each pipeline. If you run a pipeline with 64 files and 100,000 records, the output might look like this. This table explains each column in the output.

## Transactional Data Pipelines

When you load data with transactional data pipelines, the Ocient System records the transaction identifier of each SQL statement and pipeline in the `transaction_id` column of the `sys.queries`, `sys.completed_queries`, and `sys.pipelines` system catalog tables, and the `information_schema.pipelines` view. After a transactional pipeline completes, the system retains its rows in historical objects such as the `information_schema.pipelines_historical` view and `sys.pipeline_metrics_historical` system catalog table. You can join these objects to monitor the progress of active transactions and review the history of committed and rolled-back transactions.

A parent transaction groups the SQL statements that execute inside it. Use the `UUID_PREFIX` function with a prefix length of `64` on the `transaction_id` column to find the parent transaction of any statement. Rows where the `transaction_prefix_len` column is `64` belong to the parent transaction, such as `COMMIT` and `ROLLBACK` statements. Rows where the value is `96` are child statements that execute inside the transaction, such as `CREATE TRANSACTIONAL PIPELINE` statements.

For details about transactional pipelines, see **Transactional Data Pipelines**.

### Monitor Progress of Active Transactions

Track the aggregate progress of each active transaction for both parent and child transactions. This query counts the pipelines in each transaction, sums the records that the pipelines have loaded and failed, and calculates the elapsed time. The query excludes transactions that have already committed or rolled back. If you execute the query every few seconds, you can watch the number of pipelines and loaded records increase.

```

### Summarize Transaction History

Summarize all transactions on the system by state. This query classifies each parent transaction as `committed`, `rolled_back`, or `active` based on whether a `COMMIT` or `ROLLBACK` statement was executed in the transaction, and reports the number of parent transactions, the total number of statements, and the earliest and latest statement timestamps for each state.

SQL

```sql
WITH txn_queries AS (
    SELECT timestamp_start, transaction_id, transaction_prefix_len, sql
    FROM sys.queries
    WHERE transaction_id IS NOT NULL
    UNION ALL
    SELECT timestamp_start, transaction_id, transaction_prefix_len, sql
    FROM sys.completed_queries
    WHERE transaction_id IS NOT NULL
),
parent_status AS (
    SELECT UUID_PREFIX(transaction_id, 64) AS parent_txn,
        MAX(CASE WHEN transaction_prefix_len = 64
            AND LOWER(sql) LIKE 'commit%'
            THEN 1 ELSE 0 END) AS has_commit,
        MAX(CASE WHEN transaction_prefix_len = 64
            AND LOWER(sql) LIKE 'rollback%'
            THEN 1 ELSE 0 END) AS has_rollback,
        COUNT(*) AS stmts,
        MIN(timestamp_start) AS first_seen,
        MAX(timestamp_start) AS last_seen
    FROM txn_queries
    GROUP BY UUID_PREFIX(transaction_id, 64)
)
SELECT CASE
        WHEN has_commit = 1 THEN 'committed'
        WHEN has_rollback = 1 THEN 'rolled_back'
        ELSE 'active'
    END AS state,
    COUNT(*) AS parents,
    SUM(stmts) AS total_stmts,
    MIN(first_seen) AS earliest,
    MAX(last_seen) AS latest
FROM parent_status
GROUP BY 1
ORDER BY 1;
```

*Output*

SQL

```
+-------------+---------+-------------+-------------------------------+----------
| state       | parents | total_stmts | earliest                      | latest
|-------------+---------+-------------+-------------------------------+----------
| active      |      32 |      141547 | 2026-06-01 15:01:51.548000000 | 2026-06-1
| committed   |    1157 |     1639722 | 2026-05-28 21:47:06.906000000 | 2026-07-2

# Connection Driver Reference

Reference for Ocient connection drivers, including JDBC, ODBC, pyocient, and the HTTP Query API, with version compatibility and integration guidance.

Ocient® includes multiple ways to connect and issue statements or queries to the database. The most common drivers used for communicating with Ocient are the JDBC driver and the pyocient module. Many third-party tools use the JDBC driver for business intelligence, visualization, and data exploration. These drivers can also be used in custom programs by leveraging the programming language's appropriate mechanisms to use the driver, for example, using a JDBC driver directly in Java®.

# JDBC Manual

Manual for the Ocient JDBC driver, including installation, connection URLs, supported properties, authentication, query execution, and result-set handling.

The Ocient® JDBC Driver and command-line interface (CLI) enable you to connect to Ocient using a JDBC connection. Ensure that you meet the prerequisites before using the Ocient JDBC Driver. Then, invoke the CLI program, configure options, and connect to a database using the driver.

You can also use the data extract tool to extract a result set to delimited files in the target location. For details about data extracting, see **Data Extract Tool**.

For a list of commands available in the JDBC CLI, see **Commands Supported by the Ocient JDBC CLI Program**.

## Prerequisites

This software is required for the JDBC driver.

| Software | Version |
|---|---|
| Ocient | Use the latest Ocient System version. |
| Operating System (OS) | Windows®, Linux®, or macOS®.<br>Use the latest version of each OS. |
| Java® | See the **Version Compatibility**. |

## Driver Features

The Ocient JDBC connector supports these features as of the current version.

| Unicode Support | UTF-8 |
|---|---|
| Isolation Levels | Ocient does not support transactions at this time. |
| Data Types | Supports all Ocient **Data Types**. |
| Security / Encryption | Uses SSL/TLS to connect to the Ocient System.<br>TLS protocol is available as a **JDBC Configuration Option**. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

## Invoke the Ocient JDBC CLI Program

If your system meets all the necessary prerequisites, you can run the JDBC CLI by using the Ocient JDBC JAR file. To do this, follow these steps.

1. Go to the Ocient Apache® Maven™ **repository** for all JDBC versions. For more information on which version to pick, see the **Version Compatibility** page.

2. For the JDBC version you want to use, download the JAR file with dependencies. This JAR file follows the format: `ocient-jdbc4-<version number>-jar-with-dependencies.jar`.

   Move this JAR file to the directory where your Ocient System is installed.

3. From the shell terminal, run this command to launch the JDBC CLI.

   Shell

   ```
   java -classpath <path_to_jar_with_dependencies> com.ocient.cli.CLI [<username
   ```

   This example runs JDBC version 2.10.

   Shell

   ```
   java -classpath ./ocient-jdbc4-2.10-jar-with-dependencies.jar com.ocient.cli.
   ```

4. After launching, the JDBC CLI prompts you to enter your username and password.

   Shell

   ```
   Username: admin@system
   Password: admin
   ```

   The interface changes to the Ocient CLI.

```
Shell

Ocient> _
```

5 Connect to your system from the JDBC using a connection string.

Assuming the standard port `4050`, a self-signed certificate, and the SQL Node IP address `10.10.1.1`, you can connect to the system database with the following connecting string.

```
Shell

Ocient> connect to jdbc:ocient://10.10.1.1:4050/system;
```

The CLI responds with a connection message.

```
Shell

Connected to jdbc:ocient://10.10.1.1:4050/system
Ocient> _
```

Now that you are connected to your system, you can execute any queries or commands.

For Java version 1.8.0_144, **download** and install the Java Cryptography Extension (JCE) Unlimited Strength Jurisdiction Policy Files 8.

## JDBC CLI Configuration Options

The JDBC CLI reads a configuration file consisting of key-value pairs located at `~/.ocient-cli-configuration` with this format.

```shell
key1=value1
key2=value2
...
keyN=valueN
```

The JDBC CLI supports these options.

| Option | Description | Default Value |
|---|---|---|
| `cliIdleTimeoutMinutes` | Configures the idle timeout for the CLI. The CLI rejects subsequent commands and exits the process after `cliIdleTimeoutMinutes` minutes of inactivity. | `0` if left unspecified or the configuration file does not exist. |
| `performance` | Enables different levels of query result output for measuring benchmarks by using different performance options. For details, see the **PERFORMANCE** command. | `off` |
| `printUuid` | Accepts values `on` or `off`.<br>If you set the `printUuid` option to `on`, the system prints the query identifier for each query that you execute in the CLI. | `off` |
| `timing` | Enables or disables reporting the execution time of each query. For details, see the **TIMING** command. | `off` |

For supported commands, see **Commands Supported by the Ocient JDBC CLI Program**.

## Run a Transaction in the JDBC CLI

The Ocient JDBC CLI supports multi-statement transactions using SQL statements. To begin a transaction, execute the `SET AUTOCOMMIT OFF` SQL statement, and then end the transaction with the `COMMIT` or `ROLLBACK` statements. A query within the transaction reads uncommitted rows that the same connection has inserted. This example disables autocommit, inserts two rows into the `public.txn_demo` table, counts the rows in the table, and commits the transaction. Next, the example inserts two more rows in the table and counts the rows. Then, the example runs a `ROLLBACK` command to roll back the changes, and counts the rows again.

© 2026 Ocient, Inc

SQL

```
Ocient> SET AUTOCOMMIT OFF;
Ocient> INSERT INTO public.txn_demo VALUES (1, 'alpha');
Ocient> INSERT INTO public.txn_demo VALUES (2, 'beta');
Ocient> SELECT count(*) AS n_in_txn FROM public.txn_demo;
Ocient> COMMIT;

Ocient> INSERT INTO public.txn_demo VALUES (3, 'gamma');
Ocient> INSERT INTO public.txn_demo VALUES (4, 'delta');
Ocient> SELECT count(*) AS n_in_txn FROM public.txn_demo;
Ocient> ROLLBACK;
Ocient> SELECT count(*) FROM public.txn_demo;
```

## Use the Ocient JDBC Driver in Java Programs

First, you must load the Ocient driver class with this statement in a Java program using the JDBC driver.

Java

```
Class.forName("com.ocient.jdbc.JDBCDriver");
```

The driver class is located in the JDBC driver JAR file named `ocient-jdbc4.jar` and must be available in the CLASSPATH defined for the program.

## Connect Using JDBC

JDBC connection property names are case-insensitive. The driver normalizes property names internally, so `logLevel`, `loglevel`, and `LOGLEVEL` are equivalent.

SQL identifiers such as database, schema, and table names follow the Ocient identifier rules. Unquoted identifiers are case-insensitive and the driver normalizes them to lowercase. To preserve the original case of an identifier, enclose it in double quotes. For details, see **Identifiers**.

The Ocient JDBC driver supports connection properties that can be supplied using the **CONNECT** command in the JDBC CLI or as a properties object passed in a Java application.

### JDBC URL Example

This connection string includes various connection properties that trail the login credentials.

Shell

```
CONNECT TO 'jdbc:ocient://db.example.com:6432/salesdb;user=admin@system;password=ad
```

### Java DriverManager Example

Alternatively, you can use the DriverManager class to provide connection properties if you are using a JDBC connection as part of a Java application.

Java

```
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.SQLException;
import java.util.Properties;

public class OcientConnectionExample {
    public static void main(String[] args) throws SQLException {
        // Base JDBC URL: host, port, and database
        String url = "jdbc:ocient://db.example.com:6432/salesdb";

        // JDBC connection properties
        Properties props = new Properties();
        props.setProperty("user", "analytics_user");            // Ocient username
        props.setProperty("password", "StrongPassw0rd!");       // Ocient password
        props.setProperty("logLevel", "INFO");                  // Driver logging v
        props.setProperty("networkTimeout", "15000");           // 15s network time
        props.setProperty("enableBulkLoad", "true");            // Use bulk load fo
        props.setProperty("bulkLoadThreshold", "50000");        // Min rows for bul
        try (Connection conn = DriverManager.getConnection(url, props)) {
        }
    }
}
```

## Supported JDBC Connection Properties

The JDBC driver supports these connection parameters.

- The JDBC driver accepts unknown or invalid connection properties and silently ignores them.
- If a connection property appears more than once, the JDBC driver uses only the last value.

| Parameter | Description |
|---|---|
| `bulkLoadChunkSize` | The number of rows to include in each JSON data file (chunk) uploaded. The default value is `60000`. |
| `bulkLoadCleanupOnFailure` | If you set this parameter value to `true`, the driver deletes the temporary files and pipelines even if the load fails. The default value is `true`. |
| `bulkLoadFailOnError` | If you set this parameter value to `true`, `executeBatch()` fails if any `INSERT` operation fails.<br><br>If you set this parameter value to `false`, `executeBatch()` falls back to a standard multi-row `INSERT` operation if any INSERT operation fails. The default value is `false`. |
| `bulkLoadLoaderNodesCacheSeconds` | The number of seconds to cache the list of active Loader Nodes the system discovers during bulk load. When you set this parameter to a value greater than `0`, the driver caches the Loader Node list for the specified duration and forwards the same value as a server-side `CACHE_MAX_TIME` hint on the lookup query. This cache is JVM®-wide and is not specific to individual connections. Do not enable this parameter if your application connects to multiple Ocient clusters from the same JVM. The default value is `0` (disabled). |
| `bulkLoadMode` | The bulk load transport mode. Set this parameter to `ssh` to stage data using SSH/SFTP to Loader Nodes, or set it to `s3` to stage data in an S3-compatible object store. The default value is `ssh`. |
| `bulkLoadPollIntervalSeconds` | The number of seconds to wait between polling the `sys.pipelines` system catalog table for load status. The default value is `2`. |
| `bulkLoadS3AccessKeyId` | The access key identifier for authenticating to the S3 endpoint. This parameter is required when you set the `bulkLoadMode` parameter to `s3`. |
| `bulkLoadS3ApiCallTimeoutMs` | The timeout, in milliseconds, for individual S3 API calls. The default value is `120000` (two minutes). |
| `bulkLoadS3Bucket` | The S3 bucket name for staging bulk load data files. This parameter is required when you set the `bulkLoadMode` parameter to `s3`. |
| `bulkLoadS3EnablePathStyleAccess` | If you set this parameter to `true`, the driver uses path-style access for S3 requests (e.g., `http://endpoint/bucket/key` instead of `http://bucket.endpoint/key`). This parameter is required for S3-compatible services such as MinIO or Ceph. The default value is `true`. |
| `bulkLoadS3Endpoint` | The S3-compatible endpoint URL for bulk load staging (e.g., `https://s3.us-east-1.amazonaws.com`). This parameter is required when you set the |

| Parameter | Description |
| --- | --- |
| | `bulkLoadMode` parameter to `s3`. |
| `bulkLoadS3MultipartPartSize` | The size, in bytes, of each part in a multipart upload. The minimum value is `5242880` (5 MiB). The default value is `10485760` (10 MiB). |
| `bulkLoadS3MultipartThreshold` | The size, in bytes, above which the driver uses multipart upload instead of a single PUT request. The default value is `10485760` (10 MiB). |
| `bulkLoadS3Prefix` | The key prefix for staged objects in S3. The default value is `ocient-bulk-load/`. |
| `bulkLoadS3Region` | The AWS region for the S3 endpoint. The default value is `us-east-1`. |
| `bulkLoadS3SecretAccessKey` | The secret access key for authenticating to the S3 endpoint. This parameter is required when you set the `bulkLoadMode` parameter to `s3`. |
| `bulkLoadS3UploadConcurrency` | The number of data chunks to upload to S3 in parallel. Increasing this value can improve staging throughput for large batches. The default value is `1`. |
| `bulkLoadSshChannelTimeoutSeconds` | The number of seconds to wait for an SFTP channel to open on an established SSH connection during bulk load. If the channel does not open within this duration, the driver throws an error. The default value is `30`. |
| `bulkLoadSshConnectTimeoutSeconds` | The number of seconds to wait for the SSH connection and authentication to a Loader Node during bulk load. If the system does not establish a connection within this duration, the driver throws an error. The default value is `10`. |
| `bulkLoadSshKeyPath` | The absolute path to the password-less private SSH key file. The default value is `~/.ssh/id_rsa`. |
| `bulkLoadSshHostKeyVerification` | Controls how the JDBC driver verifies an SSH server host key for bulk load connections.<br><br>Supported values are:<br><br>`acceptAll` (default) — The driver accepts all host keys. The connector does not check the server host key against the `known_hosts` file and does not output warning logs.<br>`strict` — The driver accepts only hosts with keys present in the `known_hosts` file (see the `bulkLoadSshKnownHostsPath` parameter). The driver rejects unknown hosts or hosts with changed keys.<br>`acceptNew` — The driver accepts new hosts and adds their keys to the `known_hosts` file, but rejects hosts with keys changed from the data in `known_hosts`. |
| `bulkLoadSshKnownHostsPath` | The path to the `known_hosts` file, which contains SSH verification keys. The system uses this path only if the `bulkLoadSshHostKeyVerification` parameter is set to `strict` or `acceptNew`.<br><br>The default path is `~/.ssh/known_hosts`. |
| `bulkLoadSshUser` | The SSH username to use when connecting to Loader Nodes. |

| Parameter | Description |
| --- | --- |
| `bulkLoadThreshold` | The minimum number of rows in a batch group to trigger a bulk load. The default value is `25000`. |
| `bulkLoadUseAtomicPipeline` | If you set this parameter to `true`, bulk load uses an atomic pipeline that creates, starts, and monitors the pipeline in a single blocking operation `(CREATE TRANSACTIONAL PIPELINE ... START FOREGROUND)`. This mode requires the Ocient System version 27.1 or later.<br><br>Set this parameter to `false` to use the legacy create, start, monitor, and drop functionality when connecting to older servers. The default value is `true`. |
| `defaultSchema` | Default schema. |
| `enableBulkLoad` | Enables the high-speed bulk load feature. Set this parameter value to `true` to enable this feature. Otherwise, set this parameter to `false` to leave the feature disabled. The default value is `false`. |
| `force` | If set to true (case-sensitive), this parameter disables load-balancing for the connection. |
| `handshake` | Specifies the handshake protocol used for the connection.<br>Supported options include: `"CBC", "GCM", "SSO"`<br>`"GCM"` — (Galois/Counter Mode). This is the default encryption and is the recommended password encryption algorithm.<br>`"CBC"` — (Cipher Block Chaining) for password encryption.<br>`"SSO"` — Single Sign-On. |
| `identityprovider` | An SSO integration established in the database. For details, see **CREATE SSO INTEGRATION**. |
| `logfile` | The filename to use for JDBC tracing. |
| `loglevel` | If set to ERROR (warnings and errors only) or DEBUG (verbose tracing) and logfile is also set, JDBC tracing is enabled. This parameter is case-sensitive. |
| `longQueryThreshold` | Estimated query runtime in milliseconds before deeper query optimization runs.<br>`0` — Use database server default.<br>`-1` — Never run deeper optimization. |
| `maxRows` | Maximum allowed result set size in the number of rows. |
| `maxRowsPerInsertBatch` | The maximum number of rows to combine into a single multi-row `INSERT` SQL statement when executing a batch load. If the total number of rows in a batch group exceeds this limit, the driver splits the group into multiple sub-statements.<br><br>The default value is 128,000 rows. |
| `maxTempDisk` | Maximum allowed temp disk usage as a percentage (0 - 100). |

| Parameter | Description |
| --- | --- |
| `maxThreadsPerResultSet` | The maximum number of threads the client uses to fetch rows from the server per Result Set, as defined in the **official JDBC documentation**. In this context, a thread represents a logical connection to the database. Applications that create and operate on Statement objects concurrently might find value in setting this parameter. Defaults to `0`, which effectively creates an unbounded Result Set thread pool. |
| `maxTime` | Maximum allowed runtime of a query in seconds before it is canceled on the server. |
| `networkTimeout` | Network connection timeout in milliseconds.<br>If unspecified, this defaults to 10000 milliseconds. |
| `parallelism` | Limits a query to running on a specified number of cores on each CPU. |
| `password` | The password for the user. |
| `priority` | Query priority. This sets the priority for queries to run on the server side.<br>If unspecified, this defaults to `1.0`. |
| `priorityAdjustFactor` | The default query priority adjustment value. For details, see **SET ADJUSTFACTOR**. |
| `priorityAdjustTime` | The default frequency to adjust the query priority. For details, see **SET ADJUSTTIME**. |
| `serviceClassName` | Specifies the name of the service class to use for the database session. |
| `sparkMode` | When you set this parameter to `true`, the driver enables Apache® Spark™-specific JDBC behavior intended to improve compatibility with the Ocient Spark connector. For details, see **JDBC Spark Connector**.<br><br>This parameter defaults to `false` if you are connecting directly using the Ocient JDBC driver (e.g., connecting with the `DriverManager` class or CLI). Otherwise, if you are using the Spark connector (catalog or `.format("ocient")`), the default is `true`. |
| `ssoNumericAddress` | Specifies the SSO callback URL as `127.0.0.1`. When this value is `false`, the URL is `localhost`. The default value is `false`. |
| `ssoOAuthCodeCallbackPort` | If `ssoOAuthFlow=authorizationCode`, this parameter specifies the port that the SSO authorization uses.<br>If unspecified, the default value is `7050`. |
| `ssoOAuthFlow` | This parameter is only applicable if SSO authorization is enabled.<br>Forces the driver to use either the “authorizationCode” or “deviceGrant” flow to establish a Single Sign-On session.<br>If this parameter is not provided, the Ocient® System uses the “authorizationCode” flow when a web browser is available to the client and the “deviceGrant” flow when a web browser is not available to the client. |

| Parameter | Description |
| --- | --- |
| `ssoDebugMode` | When set to `true`, the system records additional log messages related to SSO. |
| `ssoOktaNativeTokenPath` | The path to the OKTA® Native Token (AES-256GCM JWE). The path is relative to your home directory (i.e. '~/'). |
| `ssoSslCallback` | Specifies whether to use HTTPS instead of HTTP for the SSO callback URL. The default value is `false`. |
| `ssoTimeoutSeconds` | The number of seconds before the SSO connection request times out. The default value is `60`. |
| `statementPooling` | ℹ This parameter has been removed as of Ocient JDBC version 2.104 and later.<br>When set to `ON`, recently used statements are cached.<br>Set to `OFF` when using a third-party application that implements statement pooling |
| `tls` | Can be set to `unverified` or `on`. Enables SSL/TLS encryption for the connection. |
| `timeoutMillis` | Number of milliseconds before cancellable operations are timed out and killed by the driver. 0 means no timeout. Default: 0 |
| `user` | The identifier of the user. |

## JVM System Properties

The Ocient JDBC driver supports JVM® system properties that control driver-wide behavior. Unlike **connection properties**, JVM system properties apply globally to all connections within the JVM. To set JVM properties, use the `-D` flag from the `java` command line. The system reads these properties once when the driver initializes and cannot change them at runtime.

### Example

This example launches the JDBC CLI with the memory throttle disabled. There is no space between `-D` and the property name.

Shell

```
java -Dcom.ocient.jdbc.rs.disable-memory-throttle=true \
  -classpath ocient-jdbc4-jar-with-dependencies.jar com.ocient.cli.CLI
```

## Supported JVM System Properties

| Property | Type | Default | Description |
|---|---|---|---|
| `com.ocient.jdbc.rs.disable-memory-throttle` | Boolean | `false` | Controls the heap-based result-set fetch throttle.<br><br>When you set this property to `false` (default), the driver pauses new `FETCH_DATA` requests when the projected heap usage exceeds 90% of `Runtime.maxMemory()`, waiting for memory to free before resuming. This action prevents the `OutOfMemoryError` error in most cases.<br><br>When you set it to `true`, the driver does not throttle on heap usage. If memory is genuinely exhausted, the JVM throws the `OutOfMemoryError` error instead of the driver waiting. |

JVM system properties are not part of the JDBC connection URL or the `Properties` object the system passes to `DriverManager.getConnection()`. You must set them at the `java` command line.

Set the `com.ocient.jdbc.rs.disable-memory-throttle` property to `true` only when you have verified that your application has sufficient heap headroom or when the throttle interferes with the expected workload behavior. Disabling the throttle can cause the `OutOfMemoryError` error if the JVM heap is exhausted.

## JDBC Bulk Loading

For very large batches, the Ocient JDBC driver provides a high-speed bulk load path. When you enable bulk loading, the driver bypasses the standard multi-row insert operation and instead stages the batch data in the **JSON Lines** format and loads it through a temporary, system-generated Ocient pipeline. The driver supports two transport modes for staging data.

- **SSH/SFTP (default)** — The driver opens an SSH connection to a Loader Node and writes JSON data files directly to the node file system using SFTP.
- **S3** — The driver uploads JSON data files to an S3-compatible bucket. The Ocient System then reads the staged files from S3 through standard pipeline mechanics.

This mode eliminates the requirement for SSH access between the client and the Loader Nodes.

Set the `bulkLoadMode` connection parameter to select the transport mode. The default value is `ssh`.

## Configuration

Follow these steps to configure bulk loading in your JDBC driver.

### Enable Bulk Loading

The JDBC driver disables bulk loading by default. To enable it, you must meet these conditions.

- Set the `enableBulkLoad` connection parameter to `true`.
- Use a parameterized `INSERT` statement that uses placeholders for values, e.g., `INSERT INTO customers (id, name, status) VALUES (?, ?, ?)`. For details, see **Set Up Parameterized Insert Statements**.
- The total number of rows in the batch group meets or exceeds the `bulkLoadThreshold` parameter.

> For recommended configuration settings for Apache® Spark™ workloads, see **Bulk Loading Best Practices**.

### Choose a Transport Mode

Set the `bulkLoadMode` connection parameter to select how the driver stages data for the pipeline. The supported values are `ssh` (default) and `s3`.

### SSH Mode Configuration

SSH mode requires passwordless SSH access from the client to all Loader Nodes in the cluster. To point the driver to your private SSH key file, set the `bulkLoadSshKeyPath` connection parameter. The client application must be able to read this file.

The driver automatically discovers available Loader Nodes by querying the **sys.nodes** and **sys.service_roles** system catalog tables.

### S3 Mode Configuration

The S3 mode stages data in an S3-compatible object store (such as Amazon® S3 or Red Hat® Ceph®) and does not require SSH access to the Loader Nodes. When you select the S3 mode, you must provide the following required connection parameters.

| Parameter | Description |
|---|---|
| `bulkLoadS3Endpoint` | The S3-compatible endpoint URL (e.g., `https://s3.us-east-1.amazonaws.com`). |
| `bulkLoadS3Bucket` | The S3 bucket name for staging data files. |
| `bulkLoadS3AccessKeyId` | The access key identifier for authenticating to the S3 endpoint. |
| `bulkLoadS3SecretAccessKey` | The secret access key for authenticating to the S3 endpoint. |

You can also set optional S3 parameters to control the region, key prefix, path-style access, multipart upload behavior, upload concurrency, and API call timeout. For the full list of S3 parameters and their defaults, see the **Supported JDBC Connection Properties** table.

The driver uploads JSON data chunks to the staging bucket, generates a `CREATE TRANSACTIONAL PIPELINE SOURCE S3` SQL statement that points the Ocient System to the staged objects, and monitors the pipeline to completion. After the pipeline finishes, the driver deletes the staged objects from S3 and drops the pipeline. On failure, this cleanup occurs only when you set the `bulkLoadCleanupOnFailure` parameter to `true` (the default).

> ⚠ The S3 access key identifier and secret access key are embedded in the pipeline DDL so that the Ocient System can read the staged objects. The pipeline is transactional and the driver drops it immediately after use. The Spark connector redacts credentials from its logs.

### Data Type Mapping

The JDBC driver supports all standard scalar types.

For complex types, Java SQL STRUCT ( `java.sql.Struct` ) types load as Ocient TUPLE types, and Java ARRAY ( `java.sql.Array` ) types load as Ocient ARRAY types.

## Set Up Parameterized `INSERT` Statements

These steps demonstrate how to use a single parameterized `INSERT` statement using the Java `PreparedStatement` class. The parameterized statement binds different values for each row.

1. Create the `PreparedStatement` object `ps` with `?` placeholders.

```java
String sql = "INSERT INTO customers (id, name, status) VALUES (?, ?, ?)";
PreparedStatement ps = conn.prepareStatement(sql);
```

2. Bind parameter values by position.

```java
ps.setLong(1, 123L);         // First ?
ps.setString(2, "Alice");    // Second ?
ps.setString(3, "ACTIVE");   // Third ?
```

3. Execute a single insert.

```java
ps.executeUpdate();
```

Or, add multiple rows as a batch.

© 2026 Ocient, Inc

Java

```
// First row
ps.setLong(1, 123L);
ps.setString(2, "Alice");
ps.setString(3, "ACTIVE");
ps.addBatch();

// Second row
ps.setLong(1, 124L);
ps.setString(2, "Bob");
ps.setString(3, "INACTIVE");
ps.addBatch();

// Send them together
int[] results = ps.executeBatch();
```

4 Close the resources.

Java

```
ps.close();
```

## Connection Encryption (SSL/TLS)

The JDBC driver can use SSL/TLS to connect to Ocient, causing all traffic to be encrypted. Specify the `tls` property on the connect statement to enable TLS support. The `tls` property supports these values.

**unverified** Traffic on the connection is encrypted, but no verification is done on the certificate received from the Ocient System.

**on** Traffic is encrypted, and the JDBC client must be able to verify the certificate received from the Ocient System.

The TLS `on` mode requires that the client knows the **Certificate Authority** that signed the certificate provided by the Ocient System. Typically, this mode requires either that

the certificate is signed by a well-known certificate authority, or the Certificate Authority certificate has been imported into the truststore of the Java system. The Java `keytool` utility is used to manipulate a Java truststore.

**Secure Connections Using TLS** discusses how you can configure user-defined certificates for the Ocient System.

## Sample Java Program Using the Ocient JDBC Driver

This sample program demonstrates how to utilize the Ocient JDBC driver to establish a connection to a database, construct a prepared SQL statement, execute the query, and iterate through the result set.

Java

```
public class OcientJDBCExample {
     public static void main(final String args[]) {
          Class.forName("com.ocient.jdbc.JDBCDriver");
          Properties props = new Properties();
          props.setProperty("user", "username");
          props.setProperty("password", "pwd");
          props.setProperty("force", "true");
          String url = "jdbc:ocient://192.168.121.82:4050/db";
          Connection conn = DriverManager.getConnection(url, props);
          PreparedStatement pstmt = conn.prepareStatement(
                              "select l_orderkey from tpch.lineitem where l_linenum
          Pstmt.setInt(1, 4);
          ResultSet rs = pstmt.executeQuery();
          while(rs.next()){
               // do something with row
          }
          rs.close();
          pstmt.close();
          conn.close();
          return;
     }
}
```

For supported classes and methods, see **JDBC Classes and Methods**.

## Run a Transaction Using the Ocient JDBC Driver

To run a multi-statement transaction with the Ocient JDBC driver in a Java program, disable the autocommit mode using `setAutoCommit(false)`, and then call the `commit()` or `rollback()` methods. For transactions, autocommit mode is on by default. Ensure that you execute SQL statements that are supported by transactions. Otherwise, the database throws an error. For a list of supported statements, see **Transactions**. This example code connects to a sample database and creates the `public.txn_demo` table. Then, the code inserts two rows and displays the row count in the table. The code commits the INSERT statements and re-runs the row count. This code inserts two more rows and displays a row count. Then, the example rolls back the transaction and displays a row count. Finally, the code enables the autocommit mode.

Java

```java
import java.sql.*;
import java.util.Properties;

public class TxnApi {
  static void show(Connection c, String label) throws SQLException {
    try (Statement s = c.createStatement();
         ResultSet rs = s.executeQuery("SELECT count(*) AS n FROM public.txn_demo")) {
      rs.next();
      System.out.println(label + " -> row count = " + rs.getInt("n"));
    }
  }
  public static void main(String[] args) throws Exception {
    String url = "jdbc:ocient://db.example.com:4050/salesdb";
    Properties p = new Properties();
    p.setProperty("user", "admin@system");
    p.setProperty("password", "admin");
    p.setProperty("tls", "unverified");
    try (Connection c = DriverManager.getConnection(url, p)) {

      // DDL must run outside a transaction (autocommit on)
      try (Statement s = c.createStatement()) {
        s.execute("DROP TABLE IF EXISTS public.txn_demo");
        s.execute("CREATE TABLE public.txn_demo (id INT, v VARCHAR(64))");
      }

      // Transaction 1: multiple inserts and read-your-writes, then commit
      c.setAutoCommit(false);
      try (Statement s = c.createStatement()) {
        s.executeUpdate("INSERT INTO public.txn_demo VALUES (1, 'alpha')");
        s.executeUpdate("INSERT INTO public.txn_demo VALUES (2, 'beta')");
        show(c, "T1 in-txn (read-your-writes, expect 2)");
      }
      c.commit();
      show(c, "T1 after COMMIT (expect 2)");

      // Transaction 2: inserts, then rollback
      try (Statement s = c.createStatement()) {
        s.executeUpdate("INSERT INTO public.txn_demo VALUES (3, 'gamma')");
        s.executeUpdate("INSERT INTO public.txn_demo VALUES (4, 'delta')");
        show(c, "T2 in-txn (expect 4)");
      }
      c.rollback();
```

```
        show(c, "T2 after ROLLBACK (expect 2)");

        c.setAutoCommit(true);
      }
    }
}
```

# Data Extract Tool

Use the Ocient Data Extract tool with the JDBC driver to export rows from tables and queries into files for backup, migration, or downstream processing.

The data extract tool is a part of the JDBC driver to unload data. You can execute the tool directly from the JDBC CLI. The tool extracts a result set to delimited or Apache® Parquet™ files in the target location. To invoke the JDBC CLI, see the **JDBC Manual**.

To use the data extract tool, you must have JDBC version 2.63 or higher.

## Supported Data Extract Formats

The data extract tool supports unloading result sets into files in specific formats. Supported extract formats are:

- CSV — Outputs result sets as text files with fields separated by a chosen delimiter.
- Parquet — Outputs result sets as Parquet files.

## General Command Structure

Here is the general structure of an extract command.

SQL

```
EXTRACT TO <location_type> [OPTIONS([param=value [,...]])] AS <query>
```

The command is case-insensitive. Each extract command must start with `EXTRACT TO`. The location type `location_type` must be either `LOCAL` for the local machine or `S3` for Amazon® Web Services℠ (AWS℠) S3. You can enclose additional options within a pair of parentheses following the keyword `OPTIONS`. The location type is required and there are required options for each location type. For the `LOCAL` location type, the options must define the file prefix `file_prefix`, and for `S3`, the options must define the file prefix `file_prefix`, bucket `bucket`, and endpoint `endpoint`. Next, the query follows the keyword `AS`.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

This example is a simple general command structure.

```sql
EXTRACT TO LOCAL OPTIONS(
  file_prefix="/home/user/out/data_",
  file_extension=".csv"
)
AS SELECT c1 FROM sys.dummy10;
```

For supported options, see **Data Extract Options**.

## Specify Options, Quoting, and Escaping Quotes

Here is the general format of options.

```sql
key1 = value1, key2 = value2, ... , keyN = valueN
```

You need to follow certain guidelines when you specify options. Keys (option names) can only consist of alphanumeric characters and are unquoted. Values can be either quoted (with the reserved character `"`) or unquoted. If values are unquoted, they can only contain alphanumeric characters. If the value has a non-alphanumeric character, you must quote it with the reserved character `"`. Note that the single quote character does not work.

```sql
OPTIONS(file_prefix = "/path/to/dir/result", header_mode = none, file_extension = "
```

To use the reserved quote character `"` as an argument, you must escape it with the backslash character `\`. To use `\` as an argument, you must escape it with another `\`. This code illustrates both of these scenarios.

```sql
OPTIONS(field_optionally_enclosed_by = "\"", escape = "\\")
```

# Data Extract Options

Use these optional options with the `EXTRACT TO` syntax and the `OPTIONS` keyword to configure the behavior of the extract.

## General Extract Options

This table describes optional options that apply to both the `LOCAL` and `S3` location types.

| Option | Description | Default |
|---|---|---|
| `FILE_TYPE` | The type of the output file for extraction. Supports extraction to a delimited `.csv` file or Parquet `.parquet` file. | `DELIMITED` |
| `FILE_PREFIX` | Dictates the prefix used on the results. When extracting to `LOCAL`, this is the prefix used to determine the path of the results. This value can be a relative or full path. When extracting to S3, this value is the prefix for the key. In either case, the system adds additional file numbers and file extensions to generate the complete filename. | `results-` |
| `FILE_PREFIX_EXISTS` | Determines the behavior if the path specified by the `FILE_PREFIX` option already exists. Supported values are: `"FAIL"` and `"OVERWRITE"`. The `"FAIL"` value throws an error, whereas `"OVERWRITE"` deletes the contents of the path. | `"FAIL"` |
| `FILE_EXTENSION` | The file extension specified for each output file. | `.csv` |
| `MAX_ROWS_PER_FILE` | If you set this option to a non-zero value, the system splits the results into files with the specified maximum number of rows per file. | `NULL` |
| `COMPRESSION` | Compression type to use for a delimited extract. Supported compression types are:<br>`NONE` — No compression<br>`GZIP` — GZip compression<br>`BZIP2` — bzip2 compression<br>`XZ` — xz compression | `NONE` |
| `RECORD_DELIMITER` | Delimiter to use between records. This supports Java® strings, so special characters can be input using escape characters. UTF-16: `\u[utf-16 value]` or Octal `\[octal value]`. | `\n` |
| `FIELD_DELIMITER` | Delimiter to use between fields within a record. This supports Java strings, so special characters | `,` |

| Option | Description | Default |
| --- | --- | --- |
| | can be input using escape characters. UTF-16: `\u[utf-16 value]` or Octal `\[octal value]`. | |
| `HEADER_MODE` | Dictates how to manage headers in result files. Supported values are `NONE`, `ALL_FILES`, and `FIRST_FILE`.<br><br>`NONE` — The tool writes all output files without an additional header.<br>`ALL_FILES` — The tool adds column names as a header in the first row of each output file. Each file has at most `MAX_ROWS_PER_FILE` + 1 total rows.<br>`FIRST_FILE` — The tool adds column names as a header in the first row of the first output file. The tool does not add the header to subsequent files. Each file has at most `MAX_ROWS_PER_FILE` total rows, inclusive of the header in the first file. | `NONE` |
| `NULL_FORMAT` | Format string to use for writing NULL values to the output files. | `""` (empty string) |
| `ENCODING` | Encoding used when writing out data to files. | The default character set of the system, as determined by the **Oracle documentation**. |
| `ESCAPE` | Character used for escaping quoted fields. Set this to the NULL character `\0` to indicate that the escape character is not specified. | `"` |
| `FIELD_OPTIONALLY_ENCLOSED_BY` | Sometimes, you need to surround fields in a character. For example, the field might have a literal comma. Generally, this character is also known as the quote character. Set this option to the NULL character `\0` to indicate that the quote character is not specified. | `"` |
| `BINARY_FORMAT` | The format with which to encode the BINARY data type. Supports `UTF-8`, `Hexadecimal`, and `Base64`. | `Hexadecimal` |
| `COMPRESSION_BLOCK_SIZE` | The number of bytes that comprise each block to be compressed; larger blocks result in better compression at the expense of more RAM usage when compressing. | `4194304` |
| `COMPRESSION_LEVEL` | An integer value [-1, 9]. Use `-1` for the GZip default compression level, `0` for no compression, or a value [1-9] where 1 indicates fastest compression and 9 indicates best compression. | `1` |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Option | Description | Default |
| --- | --- | --- |
| `NUM_COMPRESSION_THREADS` | The number of threads to use for compression. | $(number of cores * 2) |
| `NUM_FETCH_QUERIES` | The number of parallel queries to execute in the database for data extraction. | `15` |
| `ESCAPE_UNQUOTED_VALUES` | Dictates whether to write escape sequences in unquoted values. Only applicable when `FIELD_DELIMITER` is set to `,`. | `false` |
| `INPUT_ESCAPED` | Dictates whether the input is already escaped. When this option is set to true, the tool does not add escape sequences, and data is written without changes to the output file. Only applicable when `FIELD_DELIMITER` is set to `,`.<br>Ensure that data is properly escaped, otherwise the extract might produce invalid CSV data. | `false` |
| `PARTITION_MODE` | The strategy for partitioning the data. Supported values are: `NONE`, `KEY`, and `RANGE`.<br><br>When you set this option to `NONE`, the tool uses standard extraction. When you set this option to `KEY`, the tool creates subdirectories for each unique value specified by the `PARTITION_COLUMNS` option. When you set this option to `RANGE`, the tool splits the data into the number of queries specified by the `NUM_FETCH_QUERIES` option based on the range of values specified in the `PARTITION_COLUMNS` option. | `NONE` |
| `PARTITION_COLUMNS` | The comma-separated list of columns to use for partitioning data when you set the `PARTITION_MODE` option to `KEY` or `RANGE`. The `RANGE` value only allows a single column. See **File Naming Conventions** for the file path structure for multiple partitioning columns when using the `KEY` value. | `NULL` |
| `QUOTE_ALL_FIELDS` | Dictates whether all written fields are enclosed with quotes. When this option is set to true, the tool encloses all fields with the `FIELD_OPTIONALLY_ENCLOSED_BY` character. | `false` |
| `SUCCESS_MARKER` | Identifies a successful completion of the extract. If you set this option to `true`, the tool creates a file with the `_SUCCESS` suffix in the root output directory when the extract of the entire job completes successfully. | `true` |
| `TARGET_FILE_SIZE_MB` | Specifies the size in megabytes for the target output file. The data extract tool splits the output | `NULL` |

| Option | Description | Default |
| --- | --- | --- |
| | into files of approximately this size. The tool ignores this option if you set the `MAX_ROWS_PER_FILE` option. | |
| `TRANSLATE_CHARACTERS_MODE` | Character Mode to use for translating characters. Supported values are `CHAR` and `HEX`.<br>The tool performs character translation only if you specify `TRANSLATE_CHARACTERS_FROM` and `TRANSLATE_CHARACTERS_TO`. The tool replaces the Nth character in `TRANSLATE_CHARACTERS_FROM` with the Nth character in `TRANSLATE_CHARACTERS_TO` in the extracted records.<br>When `TRANSLATE_CHARACTERS_MODE` is set to CHAR, `TRANSLATE_CHARACTERS_FROM`, and `TRANSLATE_CHARACTERS_TO` must be equal-length strings of UTF-8 characters. For example: `TRANSLATE_CHARACTERS_MODE="CHAR"`, `TRANSLATE_CHARACTERS_FROM="àëï"`, `TRANSLATE_CHARACTERS_TO="aei"`<br><br>When `TRANSLATE_CHARACTERS_MODE` is set to `HEX`, `TRANSLATE_CHARACTERS_FROM`, and `TRANSLATE_CHARACTERS_TO` must be comma-separated lists of hexadecimal UTF-8 code points with the same number of list elements. For example: `TRANSLATE_CHARACTERS_MODE="HEX"`, `TRANSLATE_CHARACTERS_FROM="c3a0,c3ab,c3af"`, `TRANSLATE_CHARACTERS_TO="61,65,69"` | `CHAR` |
| `TRANSLATE_CHARACTERS_FROM` | Sequence of UTF-8 characters in the source data to translate to a corresponding character in the `TRANSLATE_CHARACTERS_TO` option. See the `TRANSLATE_CHARACTERS_MODE` option for the expected format. | `""` |
| `TRANSLATE_CHARACTERS_TO` | Sequence of UTF-8 characters to use as a replacement for the characters included in `TRANSLATE_CHARACTERS_FROM`. See the `TRANSLATE_CHARACTERS_MODE` option for the expected format. | `""` |
| `TRIM_TRAILING_ZEROS` | Dictates whether to trim trailing zeros from numeric input fields. | `false` |
| `PARQUET_COMPRESSION` | Compression type to use for a Parquet extract. Supported compression types are:<br>`NONE` — No compression<br>`ZSTD` — ZSTD compression<br>`SNAPPY` — Snappy compression<br>`GZIP` — GZip compression | `SNAPPY` |

| Option | Description | Default |
| --- | --- | --- |
| `PARQUET_ROW_GROUP_SIZE_BYTES` | The size in bytes for row groups within a Parquet output file. | `536870912` (512 MB) |

> If you do not set either the `MAX_ROWS_PER_FILE` or the `TARGET_FILE_SIZE_MB` options, the data extract tool generates one output file for each partition. For a query without partitions, the tool generates a single output file.

## S3 Extract Options

This table describes the required options that apply only to the `S3` location type. The data extract tool ignores these options when you use the `LOCAL` location type.

| Option | Description |
| --- | --- |
| `BUCKET` | S3 bucket to use. |
| `ENDPOINT` | Endpoint for S3 upload. For details, see the Amazon® documentation for **specifying endpoints**. |

This table describes optional options that apply only to the `S3` location type.

| Option | Description | Default |
| --- | --- | --- |
| `AWS_KEY_ID` | AWS Key ID. If empty, the CLI uses the Java AWS SDK default credentials provider chain documented **here**. | `""` |
| `AWS_SECRET_KEY` | AWS Secret Key. If empty, the CLI uses the Java AWS SDK default credentials provider chain documented **here**. | `""` |
| `REGION` | S3 region to upload to. Ignored when extracting to LOCAL. | `US_EAST_2` |
| `PATH_STYLE_ACCESS` | Whether **path style access** should be used to access a bucket. | `true` for JDBC version 3.4.1 and `false` for JDBC version 3.4.0 and earlier |

# File Naming Conventions

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

When you use the data extract tool, the tool produces a number of files. The Ocient® System determines the path of these files using multiple factors:

- File prefix as specified by the `FILE_PREFIX` option
  - If the `PARTITION_MODE` option is not set to `NONE`, the file prefix must be a directory and end with a forward slash. The system creates subdirectories in the Apache® Hive™ style for each partition (for example, for the `KEY` partition: `/tmp/extract/col1=val1/col2=val2` or for the `RANGE` partition: `/tmp/extract/val1<=col1<val2/`). If the `PARTITION_MODE` option is set to `NONE`, the file prefix can be a directory or a proper prefix (for example, `/tmp/extract/results_`).
- Partition mode as specified by the `PARTITION_MODE` option
- Maximum number of rows, or target size in MB, for each file as specified by the `MAX_ROWS_PER_FILE` option
  - If you do not set a maximum number of rows per file and no target file size, this part of the convention is `0`. However, if the `MAX_ROWS_PER_FILE` or `TARGET_FILE_SIZE_MB` options are set, then the system outputs rows to a single file until that limit or the lower of the two limits is reached. Then, the system generates another file with an incremented file number. The file number starts from `0`.
- Format or file extension
  - This convention applies only if the `FILE_TYPE` option is set to `DELIMITED`. For the `PARQUET` type, the file extension is always `.parquet`, even when you specify any type of compression using the `PARQUET_COMPRESSION` option.
- Compression extension
  - If you specify the `COMPRESSION` option for an extract with the `DELIMITED` type, then the tool adds the compression suffix.

## Examples

These examples show you how to use the data extract tool for extracting data to the local machine, extracting CSV data, and extracting Parquet data. Most of these examples assume the database already contains tables with data. For loading data, see **Load Data**.

### Local Extract to the Default Path

This example extracts the results of the `SELECT c1 FROM sys.dummy10` SQL query to the local machine at the relative path `result-0.csv`. The SQL query returns 10 rows with incremental numbers starting at 1. The `OPTIONS(...)` syntax is only required when you specify additional options.

SQL

```
EXTRACT TO LOCAL
AS SELECT c1 FROM sys.dummy10;
```

`sys.dummy` creates a virtual table with the specified number for rows. For details, see **Generate Tables Using sys.dummy**.

### Local CSV Extract to the Specified Path

This example extracts the results of the `SELECT c1 FROM sys.dummy10` SQL query to the local machine at the absolute path `/home/user/out/data_0.csv`. The SQL query returns 10 rows with incremental numbers starting at 1.

SQL

```
EXTRACT TO LOCAL OPTIONS(
  file_prefix="/home/user/out/data_",
  file_extension=".csv"
)
AS SELECT c1 FROM sys.dummy10;
```

### Local Parquet Extract with Partition by Key

This example partitions customer data into a Parquet file by the `country` column. This partitioning creates a Hive-style directory structure on the local machine. Use the file path `/home/user/customer_data/` with the `KEY` value for the partition strategy. Specify the target file size to be `256` MB.

The SQL query selects the identifier, name, email, and country from the `customers` table.

SQL

```
EXTRACT TO LOCAL OPTIONS(
    FILE_PREFIX = "/home/user/customer_data/",
    FILE_TYPE = PARQUET,
    PARTITION_MODE = KEY,
    PARTITION_COLUMNS = country,
    TARGET_FILE_SIZE_MB = 256
) AS SELECT id, name, email, country FROM customers;
```

The resulting file structure has these file paths.

```
/home/user/customer_data/country=US/part-0000.parquet
/home/user/customer_data/country=CA/part-0000.parquet
...
```

### S3 Parquet Extract with Compression

This example extracts all sales data from the `today_sales` table to a single Parquet file on S3 using ZSTD compression. Use the S3 bucket named `my-analytics-bucket` with the file path `daily_reports/report.parquet` using the endpoint `s3.us-east-1.amazonaws.com`.

SQL

```
EXTRACT TO S3 OPTIONS(
    BUCKET = "my-analytics-bucket",
    FILE_PREFIX = "daily_reports/report.parquet",
    ENDPOINT = "s3.us-east-1.amazonaws.com",
    FILE_TYPE = PARQUET,
    PARQUET_COMPRESSION = ZSTD
) AS SELECT * FROM today_sales;
```

### S3 Parquet Extract with Partitioning by Range

This example extracts large event data to S3 by splitting the `event_id` column into `30` parallel queries using the `RANGE` partition strategy. Specify the maximum file size in `1024` megabytes. Override the default row group size using the `PARQUET_ROW_GROUP_SIZE_BYTES` option to specify `268435456` bytes (256 MB).

Use the S3 bucket `iot-data` with the file path `events/2025-09-25/` at endpoint `s3.us-east-1.amazonaws.com`.

The SQL query selects the event identifier, sensor identifier, sensor reading, and timestamp from the `events` table.

SQL

```
EXTRACT TO S3 OPTIONS(
    BUCKET = "iot-data",
    FILE_PREFIX = "events/2025-09-25/",
    ENDPOINT = "s3.us-east-1.amazonaws.com",
    FILE_TYPE = PARQUET,
    PARTITION_MODE = RANGE,
    PARTITION_COLUMNS = "event_id",
    NUM_FETCH_QUERIES = 30,
    TARGET_FILE_SIZE_MB = 1024,
    PARQUET_ROW_GROUP_SIZE_BYTES = 268435456
) AS SELECT event_id, sensor_id, sensor_reading, ts FROM events;
```

**JDBC Manual**

© 2026 Ocient All Rights Reserved Terms Of Use Privacy Statement

# Commands Supported by the Ocient JDBC CLI Program

Reference for commands supported by the Ocient JDBC CLI program, including session management, query execution, file output, and SQL script execution.

Commands are not case-sensitive in the Ocient® JDBC CLI program.

For DDL statements, see **Data Definition Language (DDL) Statement Reference**.

> All commands, except QUIT, must end with a semicolon at the command line.

> You can cancel any query that does not update data by pressing CTRL+C.

The Ocient JDBC driver supports multi-statement transactions. By default, a connection uses the autocommit mode, in which the database commits each statement immediately. To group several statements into a single transaction, disable autocommit with **SET AUTOCOMMIT**, and then end the transaction with **COMMIT** or **ROLLBACK**.

> The HTTP Query API does not support transactions. To use transactions, connect to the Ocient System with the JDBC driver or the pyocient module.

> The Apache® Spark™ Connector supports transactions and performs the commit and rollback actions automatically. When you use the Spark Connector, you do not need to issue COMMIT or ROLLBACK commands.

## CANCEL

Cancels the current query that is still running on the system.

### Syntax

```shell
CANCEL uuid;
```

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Parameter | Data Type | Description |
| --- | --- | --- |
| uuid | String | A query Universally Unique IDentifier (UUID) that is currently running. Use **LIST ALL QUERIES**, or search the `sys.queries` table to find the UUID. You must enclose the UUID in single quotes, such as `'c87b506f-66d6-4987-8bf7-1fd4a06b64b1'`. |

## COMMIT

Commits the current transaction and permanently saves all changes made after the transaction started. This command applies only when you disable autocommit with **SET AUTOCOMMIT**. When autocommit is enabled, COMMIT has no effect.

### Syntax

Shell

```
COMMIT [ TRANSACTION ];
```

Entering the COMMIT command with no other arguments commits the current transaction on the connection. This action is equivalent to calling the `commit()` method on the JDBC Connection object.

## CONNECT

Connects to a SQL Node. For details on the connection steps, see **Connect Using JDBC**.

### Syntax

Shell

```
CONNECT TO <url> [ USER username USING password ]
```

ⓘ The `<url>` parameter must follow this format:

`jdbc:ocient://node_address1:port1[,node_address2:port2[,...]]/database_name[;property=value[;...]]`

If you do not specify the `username` and `password`, then the database uses the default credentials specified at startup.

### JDBC URL parameters

| Parameter | Description |
|---|---|
| `node_address` | A hostname or IP address.<br>The database attempts to connect using each `DNSName:Port` pair in the comma-delimited list from left to right until a successful connection happens. |
| `port` | Standard JDBC port number is `4050`.<br>For details about ports, see **Ports**. |
| `database_name` | The identifier used for your database. |

### Additional JDBC URL Parameters

The JDBC URL can include these optional parameters in the key-value format `property=value`. Separate each parameter pair by semicolons.

URL parameters are case-insensitive.

To authenticate using Single Sign-On, set the `handshake` parameter to `SSO` and leave the `user` and `password` parameters empty. For example: `jdbc:ocient://DNSName:Port[,IP2:Port2,...]/databaseName;handshake=SSO;user=;password=;`

| Parameter | Description |
|---|---|
| `bulkLoadChunkSize` | The number of rows to include in each JSON data file (chunk) uploaded. The default value is `60000`. |
| `bulkLoadCleanupOnFailure` | If you set this parameter value to `true`, the driver deletes the temporary files and pipelines even if the load fails. The default value is `true`. |
| `bulkLoadFailOnError` | If you set this parameter value to `true`, `executeBatch()` fails if any `INSERT` operation fails.<br><br>If you set this parameter value to `false`, `executeBatch()` falls back to a standard multi-row `INSERT` operation if any INSERT operation fails. The default value is `false`. |
| `bulkLoadLoaderNodesCacheSeconds` | The number of seconds to cache the list of active Loader Nodes the system discovers during bulk load. When you set this parameter to a value greater than `0`, the driver caches the Loader Node list for the specified duration and |

| Parameter | Description |
| --- | --- |
| | forwards the same value as a server-side `CACHE_MAX_TIME` hint on the lookup query. This cache is JVM®-wide and is not specific to individual connections. Do not enable this parameter if your application connects to multiple Ocient clusters from the same JVM. The default value is `0` (disabled). |
| `bulkLoadMode` | The bulk load transport mode. Set this parameter to `ssh` to stage data using SSH/SFTP to Loader Nodes, or set it to `s3` to stage data in an S3-compatible object store. The default value is `ssh`. |
| `bulkLoadPollIntervalSeconds` | The number of seconds to wait between polling the `sys.pipelines` system catalog table for load status. The default value is `2`. |
| `bulkLoadS3AccessKeyId` | The access key identifier for authenticating to the S3 endpoint. This parameter is required when you set the `bulkLoadMode` parameter to `s3`. |
| `bulkLoadS3ApiCallTimeoutMs` | The timeout, in milliseconds, for individual S3 API calls. The default value is `120000` (two minutes). |
| `bulkLoadS3Bucket` | The S3 bucket name for staging bulk load data files. This parameter is required when you set the `bulkLoadMode` parameter to `s3`. |
| `bulkLoadS3EnablePathStyleAccess` | If you set this parameter to `true`, the driver uses path-style access for S3 requests (e.g., `http://endpoint/bucket/key` instead of `http://bucket.endpoint/key`). This parameter is required for S3-compatible services such as MinIO or Ceph. The default value is `true`. |
| `bulkLoadS3Endpoint` | The S3-compatible endpoint URL for bulk load staging (e.g., `https://s3.us-east-1.amazonaws.com`). This parameter is required when you set the `bulkLoadMode` parameter to `s3`. |
| `bulkLoadS3MultipartPartSize` | The size, in bytes, of each part in a multipart upload. The minimum value is `5242880` (5 MiB). The default value is `10485760` (10 MiB). |
| `bulkLoadS3MultipartThreshold` | The size, in bytes, above which the driver uses multipart upload instead of a single PUT request. The default value is `10485760` (10 MiB). |
| `bulkLoadS3Prefix` | The key prefix for staged objects in S3. The default value is `ocient-bulk-load/`. |
| `bulkLoadS3Region` | The AWS region for the S3 endpoint. The default value is `us-east-1`. |
| `bulkLoadS3SecretAccessKey` | The secret access key for authenticating to the S3 endpoint. This parameter is required when you set the `bulkLoadMode` parameter to `s3`. |
| `bulkLoadS3UploadConcurrency` | The number of data chunks to upload to S3 in parallel. Increasing this value can improve staging throughput for large batches. The default value is `1`. |
| `bulkLoadSshChannelTimeoutSeconds` | The number of seconds to wait for an SFTP channel to open on an established SSH connection during bulk load. If the channel does not open within this duration, the driver throws an error. The default value is `30`. |
| `bulkLoadSshConnectTimeoutSeconds` | The number of seconds to wait for the SSH connection and authentication to a Loader Node during bulk load. If the system does not establish a connection |

| Parameter | Description |
| --- | --- |
| | within this duration, the driver throws an error. The default value is `10`. |
| `bulkLoadSshKeyPath` | The absolute path to the password-less private SSH key file. The default value is `~/.ssh/id_rsa`. |
| `bulkLoadSshHostKeyVerification` | Controls how the JDBC driver verifies an SSH server host key for bulk load connections.<br><br>Supported values are:<br><br>`acceptAll` (default) — The driver accepts all host keys. The connector does not check the server host key against the `known_hosts` file and does not output warning logs.<br>`strict` — The driver accepts only hosts with keys present in the `known_hosts` file (see the `bulkLoadSshKnownHostsPath` parameter). The driver rejects unknown hosts or hosts with changed keys.<br>`acceptNew` — The driver accepts new hosts and adds their keys to the `known_hosts` file, but rejects hosts with keys changed from the data in `known_hosts`. |
| `bulkLoadSshKnownHostsPath` | The path to the `known_hosts` file, which contains SSH verification keys. The system uses this path only if the `bulkLoadSshHostKeyVerification` parameter is set to `strict` or `acceptNew`.<br><br>The default path is `~/.ssh/known_hosts`. |
| `bulkLoadSshUser` | The SSH username to use when connecting to Loader Nodes. |
| `bulkLoadThreshold` | The minimum number of rows in a batch group to trigger a bulk load. The default value is `25000`. |
| `bulkLoadUseAtomicPipeline` | If you set this parameter to `true`, bulk load uses an atomic pipeline that creates, starts, and monitors the pipeline in a single blocking operation `(CREATE TRANSACTIONAL PIPELINE ... START FOREGROUND)`. This mode requires the Ocient System version 27.1 or later.<br><br>Set this parameter to `false` to use the legacy create, start, monitor, and drop functionality when connecting to older servers. The default value is `true`. |
| `defaultSchema` | Default schema. |
| `enableBulkLoad` | Enables the high-speed bulk load feature. Set this parameter value to `true` to enable this feature. Otherwise, set this parameter to `false` to leave the feature disabled. The default value is `false`. |
| `force` | If set to true (case-sensitive), this parameter disables load-balancing for the connection. |
| `handshake` | Specifies the handshake protocol used for the connection.<br>Supported options include: `"CBC", "GCM", "SSO"`<br>`"GCM"` — (Galois/Counter Mode). This is the default encryption and is the recommended password encryption algorithm. |

| Parameter | Description |
| --- | --- |
| | `"CBC"` — (Cipher Block Chaining) for password encryption.<br>`"SSO"` — Single Sign-On. |
| `identityprovider` | An SSO integration established in the database. For details, see **CREATE SSO INTEGRATION**. |
| `logfile` | The filename to use for JDBC tracing. |
| `loglevel` | If set to ERROR (warnings and errors only) or DEBUG (verbose tracing) and logfile is also set, JDBC tracing is enabled. This parameter is case-sensitive. |
| `longQueryThreshold` | Estimated query runtime in milliseconds before deeper query optimization runs.<br>`0` — Use database server default.<br>`-1` — Never run deeper optimization. |
| `maxRows` | Maximum allowed result set size in the number of rows. |
| `maxRowsPerInsertBatch` | The maximum number of rows to combine into a single multi-row `INSERT` SQL statement when executing a batch load. If the total number of rows in a batch group exceeds this limit, the driver splits the group into multiple sub-statements.<br><br>The default value is 128,000 rows. |
| `maxTempDisk` | Maximum allowed temp disk usage as a percentage (0 - 100). |
| `maxThreadsPerResultSet` | The maximum number of threads the client uses to fetch rows from the server per Result Set, as defined in the **official JDBC documentation**. In this context, a thread represents a logical connection to the database. Applications that create and operate on Statement objects concurrently might find value in setting this parameter. Defaults to `0`, which effectively creates an unbounded Result Set thread pool. |
| `maxTime` | Maximum allowed runtime of a query in seconds before it is canceled on the server. |
| `networkTimeout` | Network connection timeout in milliseconds.<br>If unspecified, this defaults to 10000 milliseconds. |
| `parallelism` | Limits a query to running on a specified number of cores on each CPU. |
| `password` | The password for the user. |
| `priority` | Query priority. This sets the priority for queries to run on the server side.<br>If unspecified, this defaults to `1.0`. |
| `priorityAdjustFactor` | The default query priority adjustment value. For details, see **SET ADJUSTFACTOR**. |
| `priorityAdjustTime` | The default frequency to adjust the query priority. For details, see **SET ADJUSTTIME**. |

| Parameter | Description |
| --- | --- |
| `serviceClassName` | Specifies the name of the service class to use for the database session. |
| `sparkMode` | When you set this parameter to `true`, the driver enables Apache® Spark™-specific JDBC behavior intended to improve compatibility with the Ocient Spark connector. For details, see **JDBC Spark Connector**.<br><br>This parameter defaults to `false` if you are connecting directly using the Ocient JDBC driver (e.g., connecting with the `DriverManager` class or CLI). Otherwise, if you are using the Spark connector (catalog or `.format("ocient")`), the default is `true`. |
| `ssoNumericAddress` | Specifies the SSO callback URL as `127.0.0.1`. When this value is `false`, the URL is `localhost`. The default value is `false`. |
| `ssoOAuthCodeCallbackPort` | If `ssoOAuthFlow=authorizationCode`, this parameter specifies the port that the SSO authorization uses.<br>If unspecified, the default value is `7050`. |
| `ssoOAuthFlow` | This parameter is only applicable if SSO authorization is enabled.<br>Forces the driver to use either the “authorizationCode” or “deviceGrant” flow to establish a Single Sign-On session.<br>If this parameter is not provided, the Ocient® System uses the “authorizationCode” flow when a web browser is available to the client and the “deviceGrant” flow when a web browser is not available to the client. |
| `ssoDebugMode` | When set to `true`, the system records additional log messages related to SSO. |
| `ssoOktaNativeTokenPath` | The path to the OKTA® Native Token (AES-256GCM JWE). The path is relative to your home directory (i.e. ’~/’). |
| `ssoSslCallback` | Specifies whether to use HTTPS instead of HTTP for the SSO callback URL. The default value is `false`. |
| `ssoTimeoutSeconds` | The number of seconds before the SSO connection request times out. The default value is `60`. |
| `statementPooling` | **i** This parameter has been removed as of Ocient JDBC version 2.104 and later.<br>When set to `ON`, recently used statements are cached.<br>Set to `OFF` when using a third-party application that implements statement pooling |
| `tls` | Can be set to `unverified` or `on`. Enables SSL/TLS encryption for the connection. |
| `timeoutMillis` | Number of milliseconds before cancellable operations are timed out and killed by the driver. 0 means no timeout. Default: 0 |
| `user` | The identifier of the user. |

The JDBC driver also supports JVM® system properties that apply globally across all connections. To set these properties, use the `-D` flag at JVM startup. For details, see **JVM System Properties**.

## DESCRIBE TABLE

Lists the columns of the specified table and its associated data types.

### Syntax

```
DESCRIBE TABLE [schema.]table [verbose]
```

| Parameter | Description |
|---|---|
| `table` | A table identifier. |
| `schema` | A qualifying schema name for the specified table.<br>If a qualifying schema is not specified for the table, the default name schema is assumed. |
| `verbose` | If specified, the Ocient System prints the full column metadata for the specified table as returned by GetColumns. |

## DESCRIBE VIEW

Returns the query text used to create the specified view.

### Syntax

```
DESCRIBE VIEW [schema.]view [verbose]
```

| Parameter | Description |
|---|---|
| `view` | A view identifier. |

| Parameter | Description |
| --- | --- |
| `schema` | A qualifying schema name for the specified table.<br>If a qualifying schema is not specified for the table, the default name schema is assumed. |
| `verbose` | If specified, the Ocient System prints the full column metadata for the specified table as returned by GetColumns. |

## EXTRACT

Extracts a result set in delimited files to a specified location. For details about using this command, see **Data Extract Tool**.

### Syntax

SQL

```
EXTRACT TO location
   { LOCAL | S3 }
   [ OPTIONS ( [ param=value [ ,... ] ] ) ] AS query
```

## GET JDBC VERSION

Returns the JDBC version of the driver.

### Syntax

Shell

```
GET JDBC VERSION
```

## GET SCHEMA

Retrieves the default name schema for tables.

### Syntax

Shell

```
GET SCHEMA
```

## KILL

Issues a hard kill command to the virtual machine to terminate a query running on the system. Use only if `CANCEL` fails.

### Syntax

```
KILL uuid
```

| Parameter | Description |
| --- | --- |
| `uuid` | A query UUID that is currently running. Use **LIST ALL QUERIES**, or search the `sys.queries` table to find the UUID. |

## LIST ALL QUERIES

List all the currently executing queries on the database. This is the equivalent of executing `SELECT * FROM sys.queries`.

### Syntax

```
LIST ALL QUERIES
```

## LIST INDEXES

Lists the indexes on the specified table and its columns.

### Syntax

```
LIST INDEXES [schema.]table [verbose]
```

© 2026 Ocient, Inc

| Parameter | Description |
| --- | --- |
| `table` | A table identifier. |
| `schema` | A qualifying schema name for the specified table.<br>If a qualifying schema is not specified for the table, the default name schema is assumed. |
| `verbose` | If specified, the Ocient System prints the full column metadata for the specified table as returned by getIndexInfo. |

## LIST SYSTEM TABLES

Lists all system catalog tables in the database.

### Syntax

Shell

```
LIST SYSTEM TABLES [verbose]
```

| Parameter | Description |
| --- | --- |
| `verbose` | If verbose is specified, the full table metadata, as returned by getTables, is printed. |

## LIST TABLES

Lists all tables (in all schemata) in the database.

### Syntax

Shell

```
LIST TABLES [verbose]
```

| Parameter | Description |
| --- | --- |
| `verbose` | If verbose is specified, the full table metadata, as returned by getTables, is printed. |

## LIST VIEWS

Lists all views (in all schemata) in the database.

### Syntax

```shell
LIST VIEWS [verbose]
```

| Parameter | Description |
| --- | --- |
| `verbose` | If verbose is specified, the full table metadata, as returned by getViews, is printed. |

## OUTPUT GIS KML

Outputs the next query in KML format to the specified filename. This flag affects only the next query.

This syntax prints out all GIS types to the KML file, and non-GIS types are added to the description of elements in the same row. You can upload this KML file to certain visualization tools.

### Syntax

```shell
OUTPUT GIS KML <filename>
```

| Parameter | Description |
| --- | --- |
| `filename` | A filename for the KML output. |

## OUTPUT NEXT QUERY

Output the next query in CSV format to the specified filename. This flag only affects the next query. All subsequent queries print out their results.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

Add `APPEND` to add output to the specified file instead of overwriting it.

### Syntax

```shell
OUTPUT NEXT QUERY filename [APPEND]
```

| Parameter | Description |
|---|---|
| `filename` | A filename for the CSV output. |

## PERFORMANCE

Enables different levels of query result output for measuring benchmarks by using different performance options.

### Syntax

```shell
PERFORMANCE [ NETWORK | DATABASE | OFF ]
```

| Parameter | Description |
|---|---|
| `OFF` | This is the default mode.<br>The system executes a query through all normal stages, including the database, client network, and client processing. |
| `NETWORK` | The system executes a query through the database and client network, but discards rows before they are processed by the client (nothing is printed to stdout).<br>Use this mode when you think the client network is hindering performance. |
| `DATABASE` | The system executes a query through the database only. The database does not send any matching rows to the client.<br>Use this mode when you think the database query execution is affecting performance. |

`PERFORMANCE ON` mode has been removed as of JDBC version 3.0.

© 2026 Ocient, Inc

# PLAN EXECUTE FILE

Executes a query plan read from a local file. This command is the file-based counterpart to the **PLAN EXECUTE INLINE** command. The command avoids CLI input parsing overhead for large plan files.

The JDBC driver reads the file as UTF-8 text and sends the plan to the server using the same wire protocol as the `PLAN EXECUTE INLINE` command. The server returns results as a normal result set.

> The `PLAN EXECUTE FILE` command requires the JDBC driver version 4.2.0 or later.

## Syntax

```
Shell

PLAN EXECUTE FILE [NEWOPIDS] <filepath>
```

| Parameter | Description |
|---|---|
| `filepath` | Path to a local file containing the query plan text. The path can be unquoted (no spaces allowed), single-quoted, or double-quoted. Relative and absolute paths are supported. |

The optional `NEWOPIDS` keyword specifies that the server generates new operator identifiers for the plan before execution.

## Examples

### Execute a Plan from a File

This example executes a plan from the `/tmp/query_plan.json` JSON file.

```
Shell

PLAN EXECUTE FILE /tmp/query_plan.json;
```

### Execute a Plan with Operator Identifiers

This example executes a plan with new operator identifiers using the `NEWOIPIDS` keyword.

```
Shell
PLAN EXECUTE FILE NEWOPIDS /tmp/query_plan.json;
```

### Execute a Plan Using a File Path with Spaces

This example executes a plan from a file path that contains spaces '/path/with spaces/plan.json'.

```
Shell
PLAN EXECUTE FILE '/path/with spaces/plan.json';
```

## PLAN EXECUTE INLINE

Executes a query plan provided directly as inline text. Use this command to run a previously generated query plan without re-optimizing it.

### Syntax

```
Shell
PLAN EXECUTE INLINE [NEWOPIDS] <plan_text>
```

| Parameter | Description |
|---|---|
| `plan_text` | The query plan text provided directly at the command line. |

The optional `NEWOPIDS` keyword specifies that the server generates new operator identifiers for the plan before execution.

For large plan files, use the **PLAN EXECUTE FILE** command instead to avoid CLI input parsing overhead.

## QUIT

Closes the command-line interface.

### Syntax

```
Shell
QUIT
```

## REPORT LOG ON

Enables Apache® Log4J 2™ -based metrics collection and redirects reporting events to the configured appenders.

> The `REPORT LOG ON` command requires JDBC driver version 2.88 or later.

The Log4j configuration determines the destination for report logs. The Ocient logger name is `com.ocient.util.ReportLogger`. For details about configuring Log4j, see **the Log4j documentation**.

The default Log4j configuration routes report logs to the `RollingFileAppender`. The default configuration includes these settings:

### Properties

- `fileName="logs/${sys:ocient.jdbc.sessionId:-unknown}/report.log"`
- `filePattern="logs/${sys:ocient.jdbc.sessionId:-unknown}/%d{yyyy-MM-dd}-%i-report.log.gz"`

### Rollover Policies

- `TimeBasedTriggeringPolicy`
- `SizeBasedTriggeringPolicy (100MB)`

You can retrieve the default configuration from the `ocient-jdbc4` jar file by using an archive utility like **unzip**. For example:

```
Shell
unzip -p <path-to-ocient-jdbc4> log4j2.xml
```

### Syntax

```
REPORT LOG ON [ interval ]
```

| Parameter | Description |
| --- | --- |
| `interval` | Optional. Sets the Log4j reporting interval in seconds.<br>If unspecified, defaults to `30`. |

## REPORT LOG OFF

Disables file-based metrics collection.

> The `REPORT LOG OFF` command requires JDBC driver version 2.88 or later.

### Syntax

```
REPORT LOG OFF
```

## ROLLBACK

Rolls back the current transaction and discards all changes made after the transaction started. This command applies only when you disable autocommit with **SET AUTOCOMMIT**. When autocommit is enabled, ROLLBACK has no effect.

### Syntax

```
ROLLBACK [ TRANSACTION ];
```

Entering ROLLBACK with no other arguments rolls back the current transaction on the connection. This action is equivalent to calling the `rollback()` method on the JDBC Connection object.

## SELECT

Retrieves the appropriate result set of a SQL `SELECT` statement.

### Syntax

```shell
SQL select statement
```

## SET AUTOCOMMIT

Enables or disables the autocommit mode for the connection. When autocommit is enabled, the database commits each statement immediately. This mode is the default. When autocommit is disabled, the database groups statements into a transaction that you complete with the **COMMIT** or **ROLLBACK** commands.

When you change autocommit from `OFF` to `ON`, the database commits any pending transactions.

### Syntax

```shell
SET AUTOCOMMIT { ON | OFF }
```

Enables or disables autocommit mode with values `ON` or `OFF`, respectively. When you enter the `ON` value, the database commits each statement immediately. This value is the default. When you enter the `OFF` value, the database groups subsequent statements into a transaction until you enter the COMMIT or ROLLBACK command.

## SET MAXROWS

Sets the maximum number of rows allowed in a result set. Applies only to the statement object that executed the command.

### Syntax

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

Shell

```
SET MAXROWS num_of_rows
```

| Parameter | Description |
| --- | --- |
| `num_of_rows` | The maximum number of rows allowed in a result set. If a query returns more rows than the specified value, the result set is truncated by `num_of_rows`. To disable this setting, you can either set the maximum rows to 0 or use the `RESET` keyword (e.g., `SET MAXROWS RESET;`). |

## SET ADJUSTFACTOR

Adjusts the query priority by a specified percentage amount at every interval set by the **SET ADJUSTTIME** command.

The `SET ADJUSTFACTOR` command requires JDBC driver version 2.52 or later.

### Syntax

Shell

```
SET ADJUSTFACTOR priorityAdjustFactor
```

| Parameter | Description |
| --- | --- |
| `priorityAdjustFactor` | A percentage amount to raise or lower the query priority. Accepted values are in the range of [-1,1].<br>At every interval set by the `priorityAdjTime`, the query priority is multiplied by `1 + priorityAdjustFactor` to get a new priority value. |

## SET ADJUSTTIME

Modifies how frequently the query priority is adjusted during the course of execution.

The `SET ADJUSTTIME` command requires JDBC driver version 2.52 or later.

### Syntax

```shell
SET ADJUSTTIME priorityAdjTime
```

| Parameter | Description |
| --- | --- |
| `priorityAdjTime` | The frequency for adjusting the query priority in seconds. |

## SET MAXTEMPDISK

Sets the maximum percentage of temporary disk used by queries. Applies only to the statement object that executed the command.

### Syntax

```shell
SET MAXTEMPDISK percentage
```

| Parameter | Description |
| --- | --- |
| `percentage` | The maximum percentage of temporary disk used by queries. Any queries exceeding this threshold are killed.<br>To disable this setting, use the `RESET` keyword (e.g., `SET MAXTEMPDISK RESET;` ). |

## SET MAXTIME

Sets the maximum query time. Applies only to the statement object that executed the command.

### Syntax

```shell
SET MAXTIME seconds
```

| Parameter | Description |
| --- | --- |
| `seconds` | The maximum query time. Queries longer than this are killed.<br>To disable this setting, you can either set the maximum time to 0 or use the `RESET` keyword (e.g., `SET MAXTIME RESET;` ). |

## SET PARALLELISM

Sets a limit on the number of cores on each CPU that can be allocated to running the query. Applies only to the statement object that executed the command.

The `parallelism` value limits a query to running on the specified number of cores on each CPU.

### Syntax

```
Shell

SET PARALLELISM parallelism
```

| Parameter | Description |
| --- | --- |
| `parallelism` | Limits a query to running on a specified number of cores on each CPU.<br>To disable this setting, you can either set the `parallelism` value to -1 or use the `RESET` keyword (e.g., `SET PARALLELISM RESET;` ). |

## SET PRIORITY

Sets the scheduling priority to use for queries. Applies only to the statement object that executed the command.

### Syntax

```
Shell

SET PRIORITY priority
```

| Parameter | Description |
| --- | --- |
| `priority` | The scheduling priority to use for queries.<br>Set from 0 to 100. To disable this setting, you can either set the priority to -1 or use the `RESET` keyword. (e.g., `SET PRIORITY RESET;` ). |

## SET SCHEMA

Changes the default schema for tables. Applies only to the statement object that executed the command.

### Syntax

Shell

```
SET SCHEMA schema
```

| Parameter | Description |
| --- | --- |
| `schema` | The default schema for new tables. |

## SET SERVICECLASS

Limits a query to using the specified service class. Applies only to the statement object that executed the command.

### Syntax

Shell

```
SET SERVICECLASS service_class_name
```

| Parameter | Description |
| --- | --- |
| `service_class_name` | The service class that a query is limited to using.<br>To disable this setting, you can use the `RESET` keyword. (e.g., `SET SERVICECLASS RESET;` ). |

## SOURCE

Reads and executes commands found in the specified file.

### Syntax

```shell
SOURCE filename
```

| Parameter | Description |
| --- | --- |
| `filename` | A valid filename or path. |

## TIMING

Enables or disables reporting the execution time of each query.

### Syntax

```shell
TIMING { ON | OFF }
```

## Connect Using JDBC

© 2026 Ocient All Rights Reserved Terms Of Use Privacy Statement

# JDBC Spark Connector

Integrate Apache Spark with Ocient using the JDBC Spark Connector to run scalable analytics on large data sets with high-performance read and write operations.

The Ocient® Apache® Spark™ connector is a **Spark DataSourceV2** implementation that adapts an Ocient System to operate as a first-class source and sink for Spark workloads. Built on top of the Ocient JDBC driver, the connector allows Spark to read from and write to Ocient tables using Spark APIs and SQL statements.

The connector implements Spark catalog and table interfaces so you can register Ocient as a catalog (for `CREATE TABLE`, `INSERT`, `SELECT`, and `SHOW TABLES` SQL statements) or use it for ad-hoc reads and writes.

## Key Features

The Ocient Spark connector includes these key features:

- Read Pushdown — The connector accelerates reads by pushing column selection, filters (including on nested fields), aggregations, and queries that only need the first N rows down to the Ocient System while still letting Spark validate the final results.
- Read Partitioning — The connector parallelizes reads by splitting data into multiple Spark partitions based on a partition column. For details, see **Read Partitioning Options**.
- **DataFrame** Write Behavior and Save Modes — The connector controls how it writes DataFrames to Ocient tables by honoring Spark save modes to append ( `Append` ), truncate-and-replace ( `Overwrite` ), or fail on existing tables ( `ErrorIfExists` ).
- Catalog Support — The connector exposes Ocient as a Spark catalog so you can use standard Spark SQL directly on an Ocient System.

## Prerequisites

To use the Ocient Spark connector, your system must meet these software requirements.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Software | Version |
| --- | --- |
| Ocient | Use Ocient System version 26.1 or later. |
| Operating System (OS) | Windows®, Linux®, or macOS®.<br>Use the latest version of each OS. |
| Apache Spark | Version 3.5 or later. |
| Java® | Version 8 or later. |
| Ocient JDBC driver | Version 4.0 or later. |

Additionally, you must have the `SELECT`, `INSERT`, `CREATE`, and `DELETE` user privileges for the specified database. For details, see **Data Control Language (DCL) Statement Reference**.

# Ocient Spark Connector Setup and Initial Use

To start working with the Ocient Spark Connector, register the connector. Then, you can start executing SQL statements.

## Connector Registration

For best results, first register the connector as a catalog in Spark.

To register the connector, edit the `spark-defaults.conf` file in your Spark install to include these lines. Replace the `username` and `password` fields with your Ocient System credentials.

Text

```
spark.sql.catalog.ocient_cat=com.ocient.spark.v2.DefaultSource
spark.sql.catalog.ocient_cat.url=jdbc:ocient://host:port/db
spark.sql.catalog.ocient_cat.user=<username>
spark.sql.catalog.ocient_cat.password=<password>
```

## Use SQL Statements

After registration, the Spark connector lets you treat your Ocient System like any other Spark catalog. The connector routes SQL operations through the catalog implementation.

Execute the Spark command `USE` to switch to your Ocient catalog and schema for SQL statements. In this case, use the `ocient_cat` catalog and `my_schema` schema.

SQL

```
USE ocient_cat.my_schema;
```

Subsequent commands default to your Ocient catalog and schema, so you no longer need to reference them.

This example creates a new table `my_new_table` with identifier `id`, name `name`, event timestamp `event`, and the structure of an integer and string `nested_date`.

SQL

```
CREATE TABLE my_new_table (
    id BIGINT,
    name VARCHAR,
    event_time TIMESTAMP,
    nested_data STRUCT<a: INT, b: STRING>
);
```

Insert a row into the new table.

SQL

```
INSERT INTO my_new_table VALUES
    (1,'foo', '2025-01-01 12:00:00', (100, 'bar'));
```

Read the row from the table.

SQL

```
SELECT * FROM my_new_table WHERE id = 1;
```

List the table.

SQL

```
SHOW TABLES;
```

Drop the table.

SQL

```
DROP TABLE my_new_table;
```

## Use Scala DataFrames

The Ocient Spark connector integrates directly with the Spark DataFrame API, so you can read from and write to Ocient tables using familiar Spark patterns. After you configure the Ocient catalog, you can reference fully qualified table names, and the connector handles all JDBC connectivity and type mapping.

The examples in this section use **Scala** to interact with an Ocient catalog.

### Examples

#### Write from Spark to Ocient

This example takes an existing Spark DataFrame `df` and writes its rows into an Ocient table `my_table`.

Scala

```
df.write.saveAsTable("ocient_cat.my_schema.my_table")
```

#### Write from Ocient to Spark

This example reads from the Ocient table `my_table` and writes its rows into a new Spark DataFrame `df2`.

Scala

```
val df2 = spark.table("ocient_cat.my_schema.my_table")
```

## Ad Hoc Usage

The Ocient Spark connector supports ad-hoc reads and writes using the Spark `.format("ocient")` method. This method is useful for brief operations, but it cannot use the Spark catalog system to create, drop, or list tables.

For example, this Spark command reads an Ocient table and creates the DataFrame `df` from its contents. Substitute `jdbc_connection` with the JDBC connection string for the database, the `username` and `pwd` values for your Ocient username and password, and `my_schema` and `my_table` with the schema and table name for the table to read.

Scala

```scala
val df = spark.read
    .format("ocient")
    .option("url", "jdbc_connection")
    .option("user", "username")
    .option("password", "pwd")
    .option("dbtable", "my_schema.my_table")
    .load()
```

This command takes the DataFrame `df` and appends its contents into an Ocient table.

Scala

```scala
df.write
    .format("ocient")
    .option("url", "jdbc_connection")
    .option("user", "username")
    .option("password", "pwd")
    .option("dbtable", "my_schema.my_table")
    .mode("append")
    .save()
```

# Bulk Loading Best Practices

Use these recommended OS and Spark settings to get reliable performance and avoid inconsistent writes when using the Ocient JDBC bulk loader with Spark.

For details on bulk loading, see **JDBC Bulk Loading**.

### Linux SSH Configuration

Increase the SSH connection capacity on Loader Nodes:

- Set `MaxStartups 1024` in the OS `sshd_config` configuration file on the `loader/SSH` endpoint hosts that accept SSH connections from the bulk loader.
- Restart the SSH service to apply the updated `sshd_config` configuration. For example, on an Ubuntu® system, run `sudo systemctl restart ssh`.

### Spark Configuration

Edit the `spark-defaults.conf` configuration file to include these settings:

- `spark.task.maxFailures = 1` — This configuration prevents Spark from retrying failed tasks and potentially duplicating writes.
- `spark.speculation = false` — This configuration prevents Spark from launching speculative duplicate tasks that can re-run writes against Ocient.

## Configuration Options

You can set specific configurations for the Ocient Spark connector through standard Spark options:

- Set globally using Spark configuration: Add options to your `spark-defaults.conf` file or your cluster Spark settings (e.g., `spark.sql.catalog.ocient_cat.url=...`).
- Set options per job or per operation: Use Spark (`.option()`) or command-line (`--conf`) statements to set options for one-time usage.

The connector passes most of these settings through to the underlying Ocient JDBC driver as connection properties, but the system interprets a few directly by the connector to shape the generated SQL.

### Connection Options

These options control how the connector establishes a JDBC connection to Ocient and identify which table or query Spark should use. All options are for both read and write operations.

| Option | Default | Description |
| --- | --- | --- |
| `url` | None | Required. The Ocient JDBC URL.<br><br>If you do not specify the `sparkMode` setting, the connector automatically sets `sparkMode=true`. |
| `user` | None | Required. The Ocient username. |
| `password` | None | Required. The password of the user. |
| `dbtable` | None | Required for adhoc commands using `.format("ocient")`. This option is the Ocient schema and table name (for example, `schema.table`). |
| `maskPassword` | 1 | Optional. Determines whether passwords are exposed in Spark connector logs. Supported values are `0` or `1`.<br><br>If this option is set to `1`, Spark connector logs mask password fields. Otherwise, Spark connector logs include password fields. |

## Read Partitioning Options

These options control how Spark splits a read into multiple partitions based on a column range, affecting parallelism and data distribution during Ocient table scans. All options are for read operations only. If you do not specify any of these options, you have only one partition.

| Option | Default | Description |
| --- | --- | --- |
| `numPartitions` | 1 | Optional. The number of Spark partitions to create for reading. |
| `partitionColumn` | None | Optional. This is a numeric, date, or timestamp column to use for partitioning the read.<br><br>If you specify the `partitionColumn` option, you can also define a value range to partition using the `lowerBound` and `upperBound` options. If you do not specify a range, the connector automatically uses the full range of values. |
| `lowerBound` | None | Optional. The minimum value of the range for the `partitionColumn` option.<br><br>If you use this option, you must also include the `upperBound` option. |

| Option | Default | Description |
| --- | --- | --- |
| `upperBound` | None | Optional. The maximum value of the range for the `partitionColumn` option.<br><br>If you use this option, you must also include the `lowerBound` option. |
| `ocient.minRowsPerPartition` | 1 | Optional. Minimum target number of rows per Spark partition for the read. The connector uses this as a hint to avoid creating many tiny partitions. This option guarantees that each planned partition covers at least this many estimated rows, where possible. |

## Read Performance Options

These options tune how efficiently the connector fetches rows from Ocient during reads, including JDBC fetch size and Ocient System internal parallelism. All options are for read operations only.

| Option | Default | Description |
| --- | --- | --- |
| `fetchSize` | 0 | The JDBC `fetchSize` in rows for read operations. When you set `fetchSize = N`, the connector asks Ocient to send up to `N` rows per network fetch call, which can reduce round-trips for large result sets. The default is 0, which lets the driver choose an appropriate fetch size. This option behaves the same way as the Spark standard JDBC `fetchsize` option. For details, see the **Spark documentation**. |
| `ocient.parallelism` | 1 | Controls Ocient internal parallel execution level for read queries. When you set `ocient.parallelism = N`, the connector appends the `USING PARALLELISM N` clause to `SELECT` SQL statements so that Ocient executes each query with `N` internal workers. This option is separate from the `numPartitions` option, which controls the number of Spark tasks that run in parallel. |

## Write Performance Options

These options tune how efficiently Spark writes data to Ocient. All options apply to write operations only.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Option | Default | Description |
| --- | --- | --- |
| `batchsize` | `4800000` | Controls how many rows Spark sends to Ocient in each JDBC batch during a write operation. When you set `batchsize = N`, the connector groups up to `N` rows per insertion batch, which can significantly improve write throughput for large DataFrame writes. The default is 4,800,000 rows. This option behaves the same way as the Spark standard JDBC `batchsize` option. For details, see the **Spark documentation**. |
| `connectRetryMaxRetries` | `1` | The number of times the connector retries opening a JDBC connection on the write path after the initial TCP connect returns the `connection refused` message (typically because the SQL Node is at capacity). Set this option to `0` to disable the retry. Only a TCP `connection refused` message triggers a retry. Connect timeouts and all other connect failures stay fatal. The retry runs before the connector sends any request, so the connector never executes the same batch twice. |
| `connectRetryDelayMs` | `60000` | The delay, in milliseconds, between connect-refused retries on the write path. The default is 60,000 milliseconds (60 seconds). This option has no effect when you set the `connectRetryMaxRetries` option to `0`. |
| `ocient.autocommit` | `false` | Controls whether write connections use autocommit mode. When this option is `true`, each batch insert commits immediately, and the connector does not coordinate a job-level transaction across tasks. When this option is `false`, the connector groups all task writes into a single transaction that commits or rolls back atomically at the job level. |

The Spark connector interprets the `connectRetryMaxRetries` and `connectRetryDelayMs` options directly and does not forward them to the JDBC driver as connection properties. These options apply only to the write path and do not affect reads.

# Data Type Mapping

The Ocient Spark connector supports all Ocient primitive types and complex types (such as array or tuple).

When Spark creates a table, the connector writes the full Spark logical type into an Ocient `TYPE HINT` clause on each column. For example, for a column that uses an Ocient

TUPLE type and maps to a Spark STRUCT type, the connector generates column DDL that includes a type hint such as `TYPE HINT 'STRUCT<myCol: STRING, another: INT>'`.

During a read operation, the connector parses this `TYPE_HINT` field to reconstruct the original Spark schema, including nested field names. If the connector does not find the hint (e.g., for a pre-existing table), the connector maps Ocient TUPLE types to Spark STRUCT types with default field names ( `_1` , `_2` , etc.).

## Data Types

This table shows the Spark data types that correspond to the equivalent Ocient types. The table also lists whether each Spark type supports round-trips, meaning you can write the type from Spark to Ocient (creating the table) and then read it back into Spark while preserving the original Spark type and structure.

| Spark Type | Ocient Type (in `CREATE TABLE` SQL Statement) | Round-trip |
|---|---|---|
| `StringType` | `VARCHAR` | Yes |
| `LongType` | `BIGINT` | Yes |
| `IntegerType` | `INTEGER` | Yes |
| `ShortType` | `SMALLINT` | Yes |
| `ByteType` | `TINYINT` | Yes |
| `DoubleType` | `DOUBLE` | Yes |
| `FloatType` | `FLOAT` | Yes |
| `DecimalType(p,s)` | `DECIMAL(p,s)` | Yes |
| `BooleanType` | `BOOLEAN` | Yes |
| `BinaryType` | `VARBINARY` | Yes |
| `DateType` | `DATE` | Yes |
| `TimestampType` | `TIMESTAMP` | Yes |
| `TimestampNTZType` | `TIMESTAMP` | Yes (with `TYPE_HINT` ) |
| `ArrayType` | `ElementType[]` | Yes (with `TYPE_HINT` ) |
| `StructType` | `TUPLE<<...>>` | Yes (with `TYPE_HINT` ) |
| `MapType` | `TUPLE<<key, val>>[]` | Yes (with `TYPE_HINT` ) |

### Spark 4.0 Types

When you run the connector on Spark 4.0 or later, the connector detects these additional Spark types at runtime using reflection and maps them to the corresponding Ocient types and `TYPE_HINT` values, without introducing a compile-time dependency on Spark 4.0 APIs.

| Spark 4.0 Type | Ocient Type (in `CREATE TABLE` SQL Statement) | `TYPE_HINT` |
|---|---|---|
| `IntervalYearMonthType` | `INTEGER` | `SPARK_INTERVAL_YEAR_MONTH` |
| `IntervalDayTimeType` | `BIGINT` | `SPARK_INTERVAL_DAY_TIME` |
| `isVariantType` | `VARCHAR` | `SPARK_VARIANT` |

## Configure Logging

The Ocient Spark connector logs diagnostic messages through **Apache Log4j 2** under the `com.ocient.spark.v2` namespace. By default, the connector inherits the root logger level configured in your Spark environment.

To change the connector log level, add the following lines to the `$SPARK_HOME/conf/log4j2.properties` file.

Text

```
logger.ocient.name  = com.ocient.spark.v2
logger.ocient.level = WARN
```

Replace `WARN` with one of these supported levels: `DEBUG`, `INFO`, `WARN`, `ERROR`, or `OFF`.

# OCGraph Java Library

OCGraph Java is a SQL-native graph analytics toolkit for Ocient to model and analyze large graphs, with subgraph extraction and vertex and edge filtering.

The `OCGraph` Java® class in the Ocient® System implements a set of graph operations (similar to Apache® Spark™ GraphX) directly on tables using JDBC SQL. The overall structure of a graph comprises at least two database tables: one for vertices (nodes) and one for edges (directed links). The OCGraph library runs graph algorithms and transformations by executing SQL over these tables.

## Getting Started

To use the OCGraph library of methods, you must have access to an installed Ocient System and the JDBC driver. For details, see **JDBC Manual**.

Use JDBC for connectivity and the `OCGraph` class for graph APIs. The Java library depends on a valid `java.sql.Statement` class to connect to the Ocient System. The class builds and executes SQL using that statement and does not manage connections itself.

### Import the `OCGraph` Class

Specify the `com.ocient.jdbc.graph.OCGraph` class in the `import` declaration.

Java

```java
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.Statement;
import com.ocient.jdbc.graph.OCGraph;
```

## Data Model Requirements

Database tables that use the `OCGraph` library must adhere to a GraphX table structure. In addition to the listed requirements, tables can include other columns.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Table | Description | Requirements |
| --- | --- | --- |
| Vertices table | A table with one row per vertex (node). This table typically represents the anchor for graph algorithms and transforms. Many methods join edges to vertices by the `id` column. | The table must contain the `id BIGINT NOT NULL` column definition as the unique vertex identifier. |
| Edges table | A table with one row per directed edge (relationship). Each row is a directed edge from a source vertex to a destination vertex. | The table must contain these column definitions: `srcid BIGINT NOT NULL`, `destid BIGINT NOT NULL` |

## Execution Mode

The `OCGraph` library supports two execution backends for graph algorithms: legacy and data flow. All algorithms prefer the data flow backend when the server supports it. You can override this default globally using the `setExecutionConfig` method.

The `ExecutionMode` enum defines the available modes.

| Mode | Description |
| --- | --- |
| `ExecutionMode.ALWAYS_LEGACY` | Forces all algorithms to use the legacy SQL execution backend. |
| `ExecutionMode.ALWAYS_DATAFLOW` | Forces all algorithms to use the data flow execution backend. If the server does not support data flows, the method throws a `SQLException` error. |
| `ExecutionMode.AUTO_FASTEST` | Selects the backend for each algorithm automatically, based on whether the server supports data flows. This mode is the default. |

### Syntax

Java

```
OCGraph.setExecutionConfig(OCGraph.ExecutionMode mode)
```

### Examples

### Set the Data Flow Mode

Force all algorithms to run in the data flow mode.

```java
OCGraph.setExecutionConfig(OCGraph.ExecutionMode.ALWAYS_DATAFLOW);
```

### Reset to the Default Mode

Reset to the default automatic mode.

```java
OCGraph.setExecutionConfig(OCGraph.ExecutionMode.AUTO_FASTEST);
```

## Subgraph and Filtering

Use a subgraph or various filters to restrict a graph to relevant vertices and edges. These methods create filtered copies or masked intersections, preserving schema and optional indexes for performance.

### subgraph

Creates filtered vertex and edge tables using vertex and triplet predicates, retaining only edges with endpoints that remain after vertex filtering. The method creates the requested indexes and performs best-effort cleanup in the event of failure.

#### Syntax

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

Java

```
subgraph(
    inputSchema,
    inputVerticesTable,
    inputEdgesTable,
    resultSchema,
    resultVerticesTable,
    resultEdgesTable,
    vertexFilter,
    edgeFilter,
    [ resultVerticesIndexes [ , ... ] ],
    [ resultEdgesIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputVerticesTable` | String | Input vertices table (must have an `id` column). |
| `inputEdgesTable` | String | Input edges table (must have `srcid` and `destid` columns). |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultVerticesTable` | String | Name of the filtered vertices table to create. |
| `resultEdgesTable` | String | Name of the filtered edges table to create. |
| `vertexFilter` | String | SQL predicate to filter the vertices (without the `WHERE` keyword). Example: `status = 'ACTIVE' AND score > 0` |
| `edgeFilter` | String | SQL predicate that the system evaluates in a triplet context using the aliases `a` (source vertex), `b` (edge), and `c` (destination vertex). Example: `b.weight > 0.5 AND a.country = c.country` |
| `resultVerticesIndexes` | ArrayList | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |
| `resultEdgesIndexes` | ArrayList | Optional. Columns to index in the result edges table (e.g., `srcid` and `destid` columns). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. |

### Example

Create an active customer subgraph that includes only purchases exceeding $50 where the source and destination share a region.

Java

```
OCGraph.subgraph(
    "sales",
    "customers",
    "purchases",
    "sales",
    "customers_active",
    "purchases_active",
    "status = 'ACTIVE' AND score > 0",
    "b.amount > 50 AND a.region = c.region",
    new ArrayList<>(List.of("id","region")),
    new ArrayList<>(List.of("srcid","destid")),
    stmt
);
```

## filterVertices

Creates a filtered subgraph by selecting vertices that match a predicate while retaining only edges with endpoints that are in the filtered vertex set.

### Syntax

Java

```
filterVertices(
    inputSchema,
    inputVerticesTable,
    inputEdgesTable,
    resultSchema,
    resultVerticesTable,
    resultEdgesTable,
    vertexFilter,
    [ resultVerticesIndexes [ , ... ] ],
    [ resultEdgesIndexes [ , ... ] ],
    stmt
)
```

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Argument | Data Type | Description |
| --- | --- | --- |
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputVerticesTable` | String | Input vertices table (must have an `id` column). |
| `inputEdgesTable` | String | Input edges table (must have `srcid` and `destid` columns). |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultVerticesTable` | String | Name of the result vertices table. The name must not conflict with the names of input tables. |
| `resultEdgesTable` | String | Name of the edges table to create. |
| `vertexFilter` | String | SQL predicate for vertices (without the `WHERE` keyword). Example: `status = 'ACTIVE'` |
| `resultVerticesIndexes` | ArrayList | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |
| `resultEdgesIndexes` | ArrayList | Optional. Columns to index in the result edges table (e.g., `srcid` and `destid` columns). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

### Example

Filter US customers and retain edges with endpoints that remain in the filtered vertex set.

Java

```
OCGraph.filterVertices(
    "sales", "customers", "purchases",
    "sales", "customers_us", "purchases_us",
    "country = 'US'",
    new ArrayList<>(List.of("id")),
    new ArrayList<>(List.of("srcid","destid")),
    stmt
);
```

## filterEdges

Creates a filtered edges table by selecting edges that match a predicate.

## Syntax

```java
filterEdges(
    inputSchema,
    inputEdgesTable,
    resultSchema,
    resultEdgesTable,
    edgeFilter,
    [ resultEdgesIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputEdgesTable` | String | Input edges table (must have `srcid` and `destid` columns). |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultEdgesTable` | String | Name of the edges table to create. |
| `edgeFilter` | String | SQL predicate on edges (without the `WHERE` keyword). Example: `weight > 0.5 AND type = 'ACTIVE'` |
| `resultEdgesIndexes` | ArrayList | Optional. Columns to index in the result edges table (e.g., `srcid` and `destid` columns). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and database connection. |

## Example

This example demonstrates how to create a filtered edges table from an existing `purchases` edge set by keeping only edges that meet a business rule ( `weight > 0.5` and `ACTIVE` ). Then, the `filterEdges` method indexes the result on the `srcid` and `destid` columns for faster lookups.

Java

```
OCGraph.filterEdges(
    "sales", "purchases",
    "sales", "purchases_filtered",
    "weight > 0.5 AND type = 'ACTIVE'",
    new ArrayList<>(List.of("srcid","destid")),
    stmt
);
```

## mask

Creates a masked subgraph by intersecting two graphs. Vertices intersect if the vertex identifier is present in both graphs. Edges intersect when the `srcid` and `destid` values are present in both graphs.

The method copies rows that intersect from the graph defined by the arguments `inputVerticesTable` and `inputEdgesTable`, including any attributes.

You can optionally create indexes on the result subgraph tables.

### Syntax

Java

```
mask(
    inputSchema,
    inputVerticesTable,
    inputEdgesTable,
    otherSchema,
    otherVerticesTable,
    otherEdgesTable,
    resultSchema,
    resultVerticesTable,
    resultEdgesTable,
    [ resultVerticesIndexes [ , ... ] ],
    [ resultEdgesIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the primary input tables. |
| `inputVerticesTable` | String | The primary vertices table to intersect (must have an `id` column).<br><br>The masked subgraph created by this method copies rows that intersect from this table. |
| `inputEdgesTable` | String | The primary edges table to intersect (must have `srcid` and `destid` columns).<br><br>The masked subgraph created by this method copies rows that intersect from this table. |
| `otherSchema` | String | Schema containing the second graph. |
| `otherVerticesTable` | String | The second vertices table to intersect. |
| `otherEdgesTable` | String | The second edges table to intersect. |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultVerticesTable` | String | Name of the vertices table to create. |
| `resultEdgesTable` | String | Name of the edges table to create. |
| `resultVerticesIndexes` | ArrayList | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |
| `resultEdgesIndexes` | ArrayList | Optional. Columns to index in the result edges table (e.g., `srcid` and `destid` columns). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

## Example

Create a masked subgraph by intersecting two graphs. The example copies vertices and edges that are present in both graphs, along with the remaining endpoints.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

Java

```
OCGraph.mask(
    "sales", "customers", "purchases",
    "ref",   "customers_ref", "purchases_ref",
    "sales", "customers_masked", "purchases_masked",
    new ArrayList<>(List.of("id")),
    new ArrayList<>(List.of("srcid","destid")),
    stmt
);
```

# Transformations

Construct new vertex or edge tables by computing derived columns, reversing direction, or aggregating duplicates. These methods do not change the original inputs. Instead, the methods materialize new results.

## mapVertices

Creates a new vertices table with the identifier `id` and computed columns. Use the `resultColumnExpressions` argument to calculate additional columns. This method can also add indexes before inserting data.

### Syntax

Java

```
mapVertices(
    inputSchema,
    inputVerticesTable,
    resultSchema,
    resultVerticesTable,
    resultColumnExpressions [ , ... ],
    [ resultVerticesIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |

| Argument | Data Type | Description |
| --- | --- | --- |
| `inputVerticesTable` | String | Input vertices table (must have an `id` column). |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultVerticesTable` | String | Name of the vertices table to create. |
| `resultColumnExpressions` | ArrayList | One or more SQL expressions defining result columns beyond `id`. Use the `AS alias_name` keyword for stable names. |
| `resultVerticesIndexes` | ArrayList | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

### Example

Create vertices by adding derived columns, `name_upper` and `is_vip`, and generate indexes for the `id` and `name_upper` columns.

Java

```
OCGraph.mapVertices(
    "sales", "customers",
    "sales", "customers_enriched",
    new ArrayList<>(List.of(
        "UPPER(name) AS name_upper",
        "CASE WHEN score > 1000 THEN true ELSE false END AS is_vip"
    )),
    new ArrayList<>(List.of("id","name_upper")),
    stmt
);
```

## mapEdges

Creates a new edges table with `srcid`, `destid`, and computed columns. Expressions should refer to input edge columns by their original names, and each computed expression should include an `AS alias` keyword.

### Syntax

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

Java

```
mapEdges(
    inputSchema,
    inputEdgesTable,
    resultSchema,
    resultEdgesTable,
    [ resultColumnExpressions [ , ... ] ],
    [ resultEdgesIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputEdgesTable` | String | Input edges table (must have `srcid` and `destid` columns). |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultEdgesTable` | String | Name of the edges table to create. |
| `resultColumnExpressions` | ArrayList | Optional. SQL expressions for additional edge columns (besides the `srcid` and `destid` columns). Use the `AS alias_name` keyword for stable names. |
| `resultEdgesIndexes` | ArrayList | Optional. Columns to index in the result edges table (e.g., `srcid` and `destid` columns). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

### Example

Create a new edges table with two columns, `discounted_amount` and `big_txn`, and generate indexes for the `srcid` and `destid` columns.

Java

```
OCGraph.mapEdges(
    "sales", "purchases",
    "sales", "purchases_enriched",
    new ArrayList<>(List.of(
        "amount * 0.9 AS discounted_amount",
        "CASE WHEN amount > 100 THEN 1 ELSE 0 END AS big_txn"
    )),
    new ArrayList<>(List.of("srcid","destid")),
    stmt
);
```

## mapTriplets

Creates a new edges table with computed columns that reference a triplet made of: `a` (source vertex), `b` (edge), and `c` (destination vertex). The output automatically includes `b.srcid` and `b.destid` columns.

### Syntax

Java

```
mapTriplets(
    inputSchema,
    inputVerticesTable,
    inputEdgesTable,
    resultSchema,
    resultEdgesTable,
    [ resultColumnExpressions [ , ... ] ],
    [ resultEdgesIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputVerticesTable` | String | Input vertices table (must have an `id` column). Used as the `a` and `c` vertices. |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns). This method uses this argument as the `b` |

| Argument | Data Type | Description |
| --- | --- | --- |
| | | edge. |
| `resultSchema` | String | A writable schema to create the result edges table. |
| `resultEdgesTable` | String | Name of the edges table to create. |
| `resultColumnExpressions` | ArrayList | Optional. SQL expressions that can reference `a`, `b`, or `c`. Use the `AS alias_name` keyword for stable names. |
| `resultEdgesIndexes` | ArrayList | Optional. Columns to index in the result edges table (e.g., `srcid` and `destid` columns). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

### Example

Create a new triplet table from the vertices and edges tables with the `amount` and `same_country` columns, and generate indexes for the `src` and `destid` columns.

Java

```
OCGraph.mapTriplets(
    "sales", "customers", "purchases",
    "sales", "purchases_triplets",
    new ArrayList<>(List.of(
        "b.amount AS amount",
        "CASE WHEN a.country = c.country THEN 1 ELSE 0 END AS same_country"
    )),
    new ArrayList<>(List.of("srcid","destid")),
    stmt
);
```

## reverseEdges

Creates a new edges table with the `srcid` and `destid` columns reversed, preserving other columns. Use this method to traverse a graph in the opposite direction.

### Syntax

Java

```
reverseEdges(
    inputSchema,
    inputEdgesTable,
    resultSchema,
    resultEdgesTable,
    [ resultEdgesIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns). |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultEdgesTable` | String | Name of the reversed edges table to create. |
| `resultEdgesIndexes` | ArrayList | Optional. Columns to index in the result edges table (e.g., `srcid` and `destid` columns). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

### Example

Transform edge direction by reversing the `srcid` and `destid` columns. The example also creates indexes for these columns.

Java

```
OCGraph.reverseEdges(
    "sales", "purchases",
    "sales", "purchases_reversed",
    new ArrayList<>(List.of("srcid","destid")),
    stmt
);
```

## groupEdges

Groups duplicate rows of the `srcid` and `destid` columns, producing one row for each unique pair of values in a new edges table. This method performs aggregations based on one or more SQL expressions.

### Syntax

Java

```
groupEdges(
    inputSchema,
    inputEdgesTable,
    resultSchema,
    resultEdgesTable,
    resultColumnExpressions [ , ... ],
    [ resultEdgesIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns). |
| `resultSchema` | String | A writable schema to create the grouped tables. |
| `resultEdgesTable` | String | Name of the grouped edges table to create. |
| `resultColumnExpressions` | ArrayList | One or more aggregate expressions for the `srcid` and `destid` columns. For details about SQL aggregations, see **Aggregate Functions**.<br><br>Use the `AS alias_name` keyword for stable names. |
| `resultEdgesIndexes` | ArrayList | Optional. Columns to index in the result edges table (e.g., `srcid` and `destid` columns). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

### Example

Create a new edge table that includes SQL aggregations for counting unique transactions `txn_count` and total sums `total_amount`. Also, this method generates indexes for the `src` and `destid` columns.

Java

```
OCGraph.groupEdges(
    "sales", "purchases",
    "sales", "purchases_grouped",
    new ArrayList<>(List.of(
        "COUNT(*) AS txn_count",
        "SUM(amount) AS total_amount"
    )),
    new ArrayList<>(List.of("srcid","destid")),
    stmt
);
```

# Triplets

Produce triplet representations that are made of `a` (source vertex), `b` (edge), and `c` (destination vertex), either as a logical view or a materialized table for downstream queries.

## createTripletsView

Creates a view that combines the edge table with the source and destination vertex attributes. This view is useful for analyzing relationships without having to repeatedly join tables. The view includes these columns:

- All original edge columns (including the `srcid` and `destid` columns).
- All source-vertex columns except `id`. Source-vertex column names have the `src_` prefix.
- All destination-vertex columns except `id`. Destination-vertex column names have the `dest_` prefix.

Use the **createTripletsTable** method if you want to create a materialized table with indexes instead of a view.

### Syntax

Java

```
createTripletsView(
    inputSchema,
    inputVerticesTable,
    inputEdgesTable,
    resultSchema,
    resultTripletsView,
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputVerticesTable` | String | Input vertices table (must have an `id` column). |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns). |
| `resultSchema` | String | A schema to create the view. |
| `resultTripletsView` | String | Name of the triplets view to create. The name must not conflict with the names of input tables. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

### Example

Create a triplets view to inspect edges with joined source and destination vertex attributes.

Java

```
OCGraph.createTripletsView(
    "sales", "customers", "purchases",
    "sales", "triplets_v",
    stmt
);
```

## createTripletsTable

Creates a materialized table that combines the edge table with the source and destination vertex attributes. This table is useful for analyzing relationships without having to repeatedly join tables. The created table includes these columns:

- All original edge columns (including the `srcid` and `destid` columns).
- All source-vertex columns except `id`. Source-vertex column names have the `src_` prefix.
- All destination-vertex columns except `id`. Destination-vertex column names have the `dest_` prefix.

Use the **createTripletsView** method if you want to create a view instead of a new table.

### Syntax

Java

```
createTripletsTable(
    inputSchema,
    inputVerticesTable,
    inputEdgesTable,
    resultSchema,
    resultTripletsTable,
    [ resultTripletsIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputVerticesTable` | String | Input vertices table (must have an `id` column). |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns). |
| `resultSchema` | String | A schema to create the triplets table. |
| `resultTripletsTable` | String | Name of the triplets table to create. The name must not conflict with the names of input tables. |
| `resultTripletsIndexes` | ArrayList | Optional. Columns to index in the result table. Specify an empty list for none. |

© 2026 Ocient, Inc

| Argument | Data Type | Description |
| --- | --- | --- |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

### Example

Create a new table for triplets. Generate indexes for the `src_id` and `dest_id` columns.

Java

```
OCGraph.createTripletsTable(
    "sales", "customers", "purchases",
    "sales", "triplets_t",
    new ArrayList<>(List.of("src_id","dest_id")),
    stmt
);
```

## Degrees

Compute degree metrics for each vertex from the edges table. These methods produce small vertex tables suitable for joins and analytics.

### inDegrees

Computes how many edges point to each vertex in an edge table by counting how many times each unique `destid` value appears. The result table has two columns: `id` (the destination vertex) and `in_degree` (the count).

### Syntax

Java

```
inDegrees(
    inputSchema,
    inputEdgesTable,
    resultSchema,
    resultVerticesTable,
    [ resultVerticesIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input table. |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns). |
| `resultSchema` | String | A schema to create the in-degree table. |
| `resultVerticesTable` | String | Name of the vertices table to create (columns include `id` and `in_degree`). |
| `resultVerticesIndexes` | ArrayList | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

**Example** Compute in-degrees per vertex and generate an index on the `id` column.

Java

```
OCGraph.inDegrees(
    "sales", "purchases",
    "sales", "customers_in_degree",
    new ArrayList<>(List.of("id")),
    stmt
);
```

## outDegrees

Computes how many edges originate from each vertex in an edge table by counting how many times each unique `srcid` value appears. The result table has two columns: `id` (the source vertex) and `out_degree` (the count).

### Syntax

Java

```
outDegrees(
    inputSchema,
    inputEdgesTable,
    resultSchema,
    resultVerticesTable,
    [ resultVerticesIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input table. |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns). |
| `resultSchema` | String | Schema to create the out-degree table. |
| `resultVerticesTable` | String | Name of the vertices table to create (columns include `id` and `out_degree`). |
| `resultVerticesIndexes` | ArrayList | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

### Example

Compute the out-degree count for each vertex and generate an index on the `id` column.

Java

```
OCGraph.outDegrees(
    "sales", "purchases",
    "sales", "customers_out_degree",
    new ArrayList<>(List.of("id")),
    stmt
);
```

## degrees

Computes the total degrees (in-degrees and out-degrees) for each vertex in an edge table by counting how many times each unique `srcid` and `destid` value appears. The result table has two columns: `id` (the destination or source vertex) and `degree` (the count).

### Syntax

Java

```
degrees(
    inputSchema,
    inputEdgesTable,
    resultSchema,
    resultVerticesTable,
    [ resultVerticesIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input table. |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns). |
| `resultSchema` | String | A schema to create the degree table. |
| `resultVerticesTable` | String | Name of the vertices table to create (columns include `id` and `degree`). |
| `resultVerticesIndexes` | ArrayList | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

**Example** Compute total degrees for each vertex and generate an index on the `id` column.

Java

```
OCGraph.degrees(
    "sales", "purchases",
    "sales", "customers_degree",
    new ArrayList<>(List.of("id")),
    stmt
);
```

# Vertex Extraction and Joins

Build vertex sets from edges and combine vertex attributes across tables. These methods are useful for shaping vertex properties and consolidating features.

## fromEdges

Builds a vertices table from an edges table by extracting the unique source and destination identifiers.

This method can optionally compute additional columns using SQL expressions by referencing the unique identifier as `ids.id`.

The created table always contains the `id` column with one additional column per expression.

### Syntax

Java

```
fromEdges(
    inputSchema,
    inputEdgesTable,
    resultSchema,
    resultVerticesTable,
    [ resultColumnExpressions [ , ... ] ],
    [ resultVerticesIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
| --- | --- | --- |
| `inputSchema` | String | A non-empty schema containing the input table. |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns). |
| `resultSchema` | String | A schema to create the result vertices table. |
| `resultVerticesTable` | String | Name of the result vertices table (always includes `id`). |
| `resultColumnExpressions` | ArrayList | Optional. Specify a list of SQL expressions that reference `ids.id` to add additional columns. |
| `resultVerticesIndexes` | ArrayList | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

**Example** Create a vertices table from edge endpoints and add a `bucket` column that assigns each vertex to one of 10 buckets. Generate an index for the `id` and `bucket` columns.

Java

```
OCGraph.fromEdges(
    "sales", "purchases",
    "sales", "customers_from_edges",
    new ArrayList<>(List.of(
        "ids.id % 10 AS bucket"
    )),
    new ArrayList<>(List.of("id","bucket")),
    stmt
);
```

## joinVertices

Merges two vertices tables by retaining every row from a primary table (`inputVerticesTable`) and selectively updating rows that also appear in the modification table (`modificationVerticesTable`). The merged table includes all vertices from the primary table that do not appear in the modification table.

Ocient Proprietary and Confidential

For vertices that appear in both tables, the method must include a list of expressions ( `resultAttributeExpressions` ) in the same column order for every non-identifier column in the merged result table. These SQL expressions can add computations to columns or simply add aliases if no changes are needed. Each expression can reference columns from the primary table (using alias `a` ) or from the modification table (using alias `b` ).

### Syntax

Java

```
joinVertices(
    inputSchema,
    inputVerticesTable,
    modificationSchema,
    modificationVerticesTable,
    resultSchema,
    resultVerticesTable,
    resultAttributeExpressions [ , ... ],
    [ resultVerticesIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the primary input table. |
| `inputVerticesTable` | String | Input vertices table (with the alias `a` ). This table must have an `id` column. |
| `modificationSchema` | String | A schema for the modification vertices table. |
| `modificationVerticesTable` | String | Modification vertices table (with the alias `b` ). This table must have an `id` column. |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultVerticesTable` | String | Name of the vertices table to create. |
| `resultAttributeExpressions` | ArrayList | A list of SQL expressions that define the non-identifier columns of the joined result.<br><br>Each expression can reference the left ( `inputVerticesTable` ) vertex as `a` and the right ( `modificationVerticesTable` ) vertex as `b` . |

© 2026 Ocient, Inc

| Argument | Data Type | Description |
| --- | --- | --- |
| | | You must end every expression with an explicit alias using `AS alias_name` so the output column names are stable. |
| `resultVerticesIndexes` | ArrayList | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

**Example** Merge vertex attributes and generate indexes for the `id` and `status` columns. This example includes two SQL expressions to update the `status` and `score` columns based on the modification vertex table using the `COALESCE` SQL reference function.

Java

```
OCGraph.joinVertices(
    "sales", "customers",
    "sales", "customers_updates",
    "sales", "customers_merged",
    new ArrayList<>(List.of(
        "COALESCE(b.new_status, a.status) AS status",
        "COALESCE(b.score_delta + a.score, a.score) AS score"
    )),
    new ArrayList<>(List.of("id","status")),
  stmt
);
```

## innerJoinVertices

Performs an inner join on two vertex tables using an equality comparison `a.id = b.id`. The result table automatically includes the `id` column from the first table.

The method must include a list of SQL expressions ( `resultAttributeExpressions` ) in the same column order for every non-identifier column in the merged result table. These SQL expressions can add computations to columns, or simply add aliases if no changes are needed. Each expression can reference columns from the primary table using the alias `a` or from the modification table using the alias `b`.

### Syntax

Java

```
innerJoinVertices(
    inputSchema,
    inputVerticesTable,
    otherSchema,
    otherVerticesTable,
    resultSchema,
    resultVerticesTable,
    resultAttributeExpressions [ , ... ],
    [ resultVerticesIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A schema for the left vertices table. |
| `inputVerticesTable` | String | Input vertices table for the left side of the join (must have an `id` column). |
| `otherSchema` | String | A schema for the right vertices table. |
| `otherVerticesTable` | String | The other vertices table for the right side of the join (must have an `id` column). |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultVerticesTable` | String | Name of the vertices table to create. |
| `resultAttributeExpressions` | ArrayList | A list of SQL expressions that define the non-identifier columns of the joined result.<br><br>Each expression can reference the left ( `inputVerticesTable` ) vertex as `a` and the right ( `otherVerticesTable` ) vertex as `b` .<br><br>You must end every expression with an explicit alias using `AS alias_name` to ensure the output column names are stable. |
| `resultVerticesIndexes` | ArrayList | Optional. Columns to index in the result vertices table (e.g., `id` ). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

**Example** Create an inner join between two vertex tables and generate an index on the `id` column.

Java

```
OCGraph.innerJoinVertices(
    "sales", "customers",
    "sales", "profiles",
    "sales", "customers_joined",
    new ArrayList<>(List.of(
        "a.id AS id",
        "a.status AS status",
        "b.tier AS tier"
    )),
    new ArrayList<>(List.of("id")),
    stmt
);
```

## outerJoinVertices

Performs a left outer join between two vertices tables using an equality comparison `a.id = b.id`. The result table includes all rows from the left table. For left-table rows that have no match in the right table, any expression that reads columns from the right table with the alias `b` evaluates to NULL (while expressions that only read the table with the alias `a` remain non-NULL as usual).

The method must include a list of SQL expressions ( `resultAttributeExpressions` ) in the same column order for every non-identifier column in the merged result table. These SQL expressions can add computations to columns or simply add aliases if no changes are needed. Each expression can reference columns from the primary table using the alias `a` or from the modification table using the alias `b`.

### Syntax

Java

```
outerJoinVertices(
    inputSchema,
    inputVerticesTable,
    otherSchema,
    otherVerticesTable,
    resultSchema,
    resultVerticesTable,
    resultAttributeExpressions [ , ... ],
    [ resultVerticesIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables (aliased as `a`). |
| `inputVerticesTable` | String | Left vertices table (must have an `id` column). |
| `otherSchema` | String | Schema of the right vertices table (with the alias `b`). |
| `otherVerticesTable` | String | Right vertices table (must have an `id` column). |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultVerticesTable` | String | Name of the vertices table to create. |
| `resultAttributeExpressions` | ArrayList | A list of SQL expressions that define the non-ID columns of the joined result.<br><br>Each expression can reference the left (`inputVerticesTable`) vertex as `a` and the right (`otherVerticesTable`) vertex as `b`.<br><br>You must end every expression with an explicit alias using `AS alias_name` to ensure the output column names are stable. |
| `resultVerticesIndexes` | ArrayList | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

**Example** Perform a left outer join on two vertices tables and generate an index on the `id` column.

Java

```
OCGraph.outerJoinVertices(
    "sales", "customers",
    "sales", "profiles",
    "sales", "customers_joined",
    new ArrayList<>(List.of(
        "a.id AS id",
        "a.status AS status",
        "b.tier AS tier"
    )),
    new ArrayList<>(List.of("id")),
    stmt
);
```

## collectNeighbors

For each vertex in a table, this method collects information on neighbors (identifier and any attributes) as an array of tuples. For a specified direction ( `IN` , `OUT` , or `BOTH` ), the method aggregates tuples representing each neighboring vertex into an array.

The direction types are:

- `IN` — Neighbors with edges pointing to the vertex (edges where `destid = id` ).
- `OUT` — Neighbors that the vertex points to (edges where `srcid = id` ).
- `BOTH` — Union of `IN` and `OUT` with neighbors from incoming ( `destid = id` ) and outgoing ( `srcid = id` ) edges.

The result table has the columns `id` (the vertex identifier) and `neighbors` (an array of tuples representing each neighbor).

If an error occurs after table creation, the method drops the result table.

### Syntax

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

Java

```
collectNeighbors(
    inputSchema,
    inputVerticesTable,
    inputEdgesTable,
    resultSchema,
    resultTable,
    direction,
    [ resultIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputVerticesTable` | String | Input vertices table (must have an `id` column). |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns). |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultTable` | String | Name of the neighbors collection table (with the `id` and `neighbors` columns). |
| `direction` | EdgeDirection | Specifies the direction of traversal. Supported values are:<br>`IN` — Neighbors that have edges pointing to the vertex (edges where `destid = id`).<br>For example, if an edge `5` points to `10`, then for `id=10`, neighbor `5` is included.<br><br>`OUT` — Neighbors that the vertex points to (edges where `srcid = id`). For example, if an edge `5` points to `10`, then for `id=5`, neighbor `10` is included.<br><br>`BOTH` — The union of `IN` and `OUT`. This traversal includes neighbors from edges pointing to `id` and edges from `id`. |
| `resultIndexes` | ArrayList | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

**Example** Collect incoming neighbors for each vertex and generate an index on the `id` column. The `direction` argument set to `IN` collects neighbors pointing to `id`.

```java
OCGraph.collectNeighbors(
    "sales", "customers", "purchases",
    "sales", "neighbors_in",
    OCGraph.EdgeDirection.IN,
    new ArrayList<>(List.of("id")),
    stmt
);
```

## collectEdges

For each vertex in a table, this method collects an array of adjacent edge rows based on the specified direction. The result table has two columns: `id` (the vertex identifier) and `edges` (an array of tuples, each tuple containing all columns from the edges table for a connected edge).

The `direction` types are:

- `IN` — Edges pointing to the vertex (edges where `destid = id`).
- `OUT` — Edges originating from the vertex (edges where `srcid = id`).
- `BOTH` — Union of `IN` and `OUT` that includes edges from incoming (`destid = id`) and outgoing (`srcid = id`) directions. This direction retains duplicates.

If an error occurs after table creation, the method drops the result table.

### Syntax

Java

```
collectEdges(
    inputSchema,
    inputVerticesTable,
    inputEdgesTable,
    resultSchema,
    resultTable,
    direction,
    [ resultIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputVerticesTable` | String | Input vertices table (must have an `id` column). |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns). |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultTable` | String | Name of the edge collection table (with the `id` and `edges` columns). |
| `direction` | EdgeDirection | Specifies the direction of traversal. Supported values are:<br>`IN` — Neighbors that have edges pointing to the vertex (edges where `destid = id`).<br>For example, if an edge `5` points to `10`, then for `id=10`, neighbor `5` is included.<br><br>`OUT` — Neighbors that the vertex points to (edges where `srcid = id`). For example, if an edge `5` points to `10`, then for `id=5`, neighbor `10` is included.<br><br>`BOTH` — The union of `IN` and `OUT`. This traversal includes neighbors from edges pointing to `id` and edges from `id`. |
| `resultIndexes` | ArrayList | Optional. Columns to index. Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

**Example** Collect outgoing edges for each vertex and generate an index for the `id` column. The example sets the `direction` to `OUT` to collect edges from `id`.

Java

```
OCGraph.collectEdges(
    "sales", "customers", "purchases",
    "sales", "outgoing_edges",
    OCGraph.EdgeDirection.OUT,
    new ArrayList<>(List.of("id")),
    stmt
);
```

# Algorithms

High-level graph algorithms that iterate over the graph structure to produce labels, components, or counts.

## labelPropagation

Executes the **Label Propagation Algorithm** (LPA) to assign community labels to vertices.

Each vertex starts with its own identifier as its label. For a number set by the `maxIterations` argument, each vertex updates its label to the most frequent label among its neighbors. The algorithm determines ties by choosing the smallest label. The algorithm uses temporary tables for intermediate results and drops these tables when the process completes or if it fails. Isolated vertices retain their initial label. The final table stores `id` and `label` columns and can include indexes.

### Syntax

© 2026 Ocient, Inc

Java

```
labelPropagation(
    inputSchema,
    inputVerticesTable,
    inputEdgesTable,
    resultSchema,
    resultVerticesTable,
    maxIterations,
    [ resultVerticesIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputVerticesTable` | String | Input vertices table (must have an `id` column). |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns). |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultVerticesTable` | String | Name of the vertices table to create (columns include `id` and `label`). |
| `maxIterations` | numeric | Maximum number of iterations (must be `1` or greater). |
| `resultVerticesIndexes` | ArrayList | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

**Example** Run label propagation for 10 iterations and assign labels to vertices. Generate an index on the `id` column.

© 2026 Ocient, Inc

Java

```
OCGraph.labelPropagation(
    "sales", "customers", "purchases",
    "sales", "lpa_labels",
    10,
    new ArrayList<>(List.of("id")),
    stmt
);
```

## connectedComponents

Identifies the connected components of an undirected graph. This algorithm configures a Pregel computation in which each vertex initially sets its component label equal to its own identifier `id`.

In each iteration, vertices send their component label to neighbors. Each vertex updates based on the aggregated minimum value of its current component label and any received values. The process repeats until no more updates occur.

The result table maps each vertex `id` to its final `component` label.

### Syntax

Java

```
connectedComponents(
    inputSchema,
    inputVerticesTable,
    inputEdgesTable,
    resultSchema,
    resultVerticesTable,
    [ resultVerticesIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputVerticesTable` | String | Input vertices table (must have an `id` column). |

| Argument | Data Type | Description |
| --- | --- | --- |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns). |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultVerticesTable` | String | Name of the vertices table to create. |
| `resultVerticesIndexes` | ArrayList | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

**Example** Compute connected components and generate an index on the `id` column.

Java

```
OCGraph.connectedComponents(
    "sales", "customers", "purchases",
    "sales", "components",
    new ArrayList<>(List.of("id")),
    stmt
);
```

## stronglyConnectedComponents

Computes strongly connected components (SCC) in a directed graph. This method runs a recursive algorithm that partitions vertices into subsets where every vertex is reachable from other vertices in the same subset.

This method uses recursive partitioning. The algorithm selects a pivot (typically the minimum identifier `id`), computes its predecessor set (vertices that can reach the pivot), and its descendant sets (vertices reachable from the pivot). Then, the method identifies the SCC as their intersection, removes that SCC from the graph, and recurses on the remainder until all vertices have been assigned to an SCC. The output contains columns for the `id` and `component` identifiers (the minimum `id` in the SCC).

The method creates temporary tables in the result schema to store intermediate results. This method drops these tables when the computation completes or fails. The final result table contains two columns: `id` (vertex identifier) and `component` (the minimum vertex identifier in its SCC subset).

## Syntax

Java

```
stronglyConnectedComponents(
    inputSchema,
    inputVerticesTable,
    inputEdgesTable,
    resultSchema,
    resultVerticesTable,
    [ resultVerticesIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputVerticesTable` | String | Input vertices table (must have an `id` column). |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns). |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultVerticesTable` | String | Name of the vertices table to create (columns include `id` and `component`). |
| `resultVerticesIndexes` | ArrayList | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

## Example

Compute the SCC and generate an index on the `id` column.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

Java

```
OCGraph.stronglyConnectedComponents(
    "sales", "customers", "purchases",
    "sales", "scc",
    new ArrayList<>(List.of("id")),
    stmt
);
```

## TriangleCount

TriangleCount identifies all 3-cycles (triangles) in the graph and counts how many distinct triangles each vertex participates in.

The algorithm first builds a canonical, undirected edge set by ensuring `srcid < destid` and removing duplicates to prevent double-counting. If your input edges are already canonicalized and deduplicated, use `TriangleCount.runPreCanonicalized` to skip preprocessing for faster performance.

The method then counts triangles ( `a` , `b` , `c` ) where `a < b < c` by intersecting neighbor lists and aggregates per-vertex participation to produce a result table with the `id` and `triangle_count` columns.

### `run` syntax

Java

```
TriangleCount.run(
    inputSchema,
    inputVerticesTable,
    inputEdgesTable,
    resultSchema,
    resultVerticesTable,
    [ resultVerticesIndexes [ , ... ] ],
    stmt
)
```

### `runPreCanonicalized` syntax

Java

```
TriangleCount.runPreCanonicalized(
    inputSchema,
    inputVerticesTable,
    canonicalEdgesTable,
    resultSchema,
    resultVerticesTable,
    [ resultVerticesIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputVerticesTable` | String | Input vertices table (must have an `id` column). |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns).<br><br>For `runPreCanonicalized` execution, the method assumes this table is already canonicalized (e.g., `srcid < destid`) and deduplicated. |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultVerticesTable` | String | Name of the vertices table to create (columns include `id` and `triangle_count`). |
| `resultVerticesIndexes` | ArrayList | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

## Examples

### Count Triangles Using `run`

Canonicalize the raw edges internally, count unique triangles, and write per-vertex triangle counts with an index on the `id` column.

Java

```
OCGraph.TriangleCount.run(
    "sales",
    "customers",
    "purchases",
    "sales",
    "triangle_counts",
    new ArrayList<>(List.of("id")),
    stmt
);
```

### Count Triangles Using `runPreCanonicalized`

Use a pre-canonicalized, deduplicated edge table to count triangles and write per-vertex triangle counts with an index on the `id` column.

Java

```
OCGraph.TriangleCount.runPreCanonicalized(
    "sales",
    "customers",
    "purchases_canonical",
    "sales",
    "triangle_counts",
    new ArrayList<>(List.of("id")),
    stmt
);
```

## pregel

Provides a generic vertex-centered iteration framework for custom graph algorithms, similar to the **Pregel model**.

Each iteration updates vertex states by sending messages along edges and then aggregating these messages to compute new states. The algorithm continues iterating until it reaches convergence (no state changed or no messages produced) or a specified iteration cap.

The algorithm uses multiple specified SQL expressions.

© 2026 Ocient, Inc

## Syntax

Java

```
pregel(
    inputSchema,
    inputVerticesTable,
    inputEdgesTable,
    resultSchema,
    resultVerticesTable,
    initializerExpr,
    [ sendToSourceExpr ],
    [ sendToDestExpr ],
    aggregateExpr,
    updaterExpr,
    maxIterations,
    [ resultVerticesIndexes [ , ... ] ],
   stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputVerticesTable` | String | Input vertices table (must have an `id` column). |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns). |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultVerticesTable` | String | Name of the vertices table to create (columns include `id` and `result`). |
| `initializerExpr` | String | A SQL expression to compute the initial state for each vertex (e.g., `CASE WHEN type = 'seed' THEN 1.0 ELSE 0.0 END`). |
| `sendToSourceExpr` | String | Optional. Defines the message sent to the source vertex of an edge, referencing the current vertex states `a.state` (source) and `c.state` (destination), and any edge attributes in `b`.<br>Example: `CASE WHEN a.country = c.country THEN 1 ELSE 0 END` |
| `sendToDestExpr` | String | Optional. Defines the message sent to the destination vertex of an edge, referencing the current vertex states |

| Argument | Data Type | Description |
| --- | --- | --- |
| | | `a.state` (source) and `c.state` (destination), and any edge attributes in `b`.<br>Example: `CASE WHEN a.country = c.country THEN 1 ELSE 0 END` |
| `aggregateExpr` | String | A SQL aggregation to combine messages per vertex (e.g., `SUM(msg)`).<br>For a list of supported aggregations, see **Aggregate Functions**. |
| `updaterExpr` | String | A SQL expression to compute the next state from the current state and aggregated messages.<br><br>For example, this code updates the state to the minimum current state and the aggregated message (similar to the **connectedComponent** method): `LEAST(a.state, COALESCE(m.aggregated_message, a.state)) AS state` |
| `maxIterations` | numeric | Maximum number of iterations (must be either `-1` or a value of `1` or greater).<br><br>If this value is `-1`, the Pregel algorithm has no limit, and it runs until convergence.<br><br>A value of `0` causes the algorithm to return an error. |
| `resultVerticesIndexes` | ArrayList | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

## Example

Run a simple Pregel computation summing incoming edge amounts into the vertex state for 10 iterations at most, and generate an index on the `id` column.

Java

```
OCGraph.pregel(
    "sales", "customers", "purchases",
    "sales", "pregel_result",
    "0 AS state",
    "b.amount",
    null,
    "SUM(msg) AS aggregated_message",
    "state + COALESCE(aggregated_message, 0) AS state",
    10,
    new ArrayList<>(List.of("id")),
    stmt
);
```

# Paths and Ranking

These methods include the shortest-path and PageRank algorithms.

## shortestPaths

Computes the shortest distance from every vertex to each set of landmark vertices using an iterative relaxation algorithm. The algorithm resembles **Bellman-Ford** but simultaneously handles multiple destinations.

Each landmark starts at distance `0` and all others at positive infinity. On each iteration, the algorithm examines every edge and checks whether traveling through the connected neighbor would yield a shorter route to a landmark. If a shorter route exists, the algorithm updates the distance of the source vertex. The process stops when no distances improve, or the algorithm reaches the maximum number of iterations.

After the process finishes, the algorithm writes a result table with the `srcid`, `destid`, and `distance` columns.

### Syntax

Java

```
shortestPaths(
    inputSchema,
    inputVerticesTable,
    inputEdgesTable,
    resultSchema,
    resultTable,
    landmarks [ , ... ],
    [ edgeWeightColumn ],
    maxIterations,
    [ resultIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputVerticesTable` | String | Input vertices table (must have an `id` column). |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns). |
| `resultSchema` | String | A writable schema to create the result table. |
| `resultTable` | String | Name of the distances result table. This table has the `srcid`, `destid`, and `distance` columns. |
| `landmarks` | ArrayList | One or more landmark vertex identifiers. This list must be non-empty and contain no NULLs. |
| `edgeWeightColumn` | String | Optional. The name of an edge weight column.<br>If you do not specify this argument, the default value is `1.0`. |
| `maxIterations` | numeric | Maximum number of relaxation iterations. This value must be `1` or greater. |
| `resultIndexes` | ArrayList | Optional. The list of columns to index in the result table (`srcid`, `destid`, and `distance` columns).<br><br>Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

### Example

Compute distances from landmarks and generate indexes on the `src` and `dest` columns.

Java

```
OCGraph.shortestPaths(
    "sales", "customers", "purchases",
    "sales", "distances",
    new ArrayList<>(List.of(1L, 42L)),
    null, // unweighted
    10,
    new ArrayList<>(List.of("srcid","destid")),
    stmt
);
```

## staticPageRank

Computes **PageRank** scores for each vertex over a fixed number of iterations.

The algorithm follows the standard PageRank formula with a damping factor ( `dampingFactor` ) and uses common table expressions to calculate contributions from incoming edges and redistribute rank from dangling nodes.

The algorithm supports two variants:

- Standard PageRank — All vertices start with rank `1.0/N` , where `N` is the number of vertices. Specify this variant if `personalizationSrcId` is `null` .
- Personalized PageRank — The specified vertex starts with a rank of `1.0` , while others start with a rank of `0.0` . Specify this variant if `personalizationSrcId` is a vertex identifier.

After running PageRank for a fixed number of iterations, the method writes a result vertices table containing all original vertex columns with a new PageRank scoring column.

### Syntax

Java

```
staticPageRank(
    inputSchema,
    inputVerticesTable,
    inputEdgesTable,
    resultSchema,
    resultVerticesTable,
    numIterations,
    dampingFactor,
    [ resultVerticesIndexes [ , ... ] ],
    [ personalizationSrcId ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputVerticesTable` | String | Input vertices table (must have an `id` column). |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns). |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultVerticesTable` | String | Name of the vertices table to create (columns include all vertex columns and a `pagerank` column). |
| `numIterations` | numeric | Number of iterations to run. This value must be 1 or greater. |
| `dampingFactor` | numeric | The damping factor, a value between `0.0` and `1.0`, that controls how the PageRank random surfer moves across vertices.<br><br>A high value (e.g., `0.85`) puts more emphasis on link structure, encouraging the algorithm to move from each vertex to a neighbor. This value means PageRank scores tend to concentrate around well-linked regions.<br><br>A lower value (e.g., `0.50`) allows the algorithm to ignore edges and instead jump to a vertex chosen from a base distribution. For standard PageRank, this base is uniform over all vertices. For personalized PageRank, the base is biased toward the specified vertex. This behavior creates more uniform scoring with less sensitivity to link topology. |

© 2026 Ocient, Inc

| Argument | Data Type | Description |
| --- | --- | --- |
| | | If this value is outside the range `0.0` to `1.0`, the function raises an error. |
| `resultVerticesIndexes` | ArrayList | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |
| `personalizationSrcId` | Long | Determines whether PageRank uses the standard or the personalized variant.<br><br>For personalized mode, specify a vertex identifier. PageRank scoring starts with this vertex set at `1.0`, while all other vertices start at `0.0`.<br><br>For standard mode, specify `null`. All vertices start with rank `1.0/N`, where `N` is the number of vertices. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

### Example

Run fixed-iteration PageRank and generate an index on the `id` column. This example uses a damping factor of `0.85` to ensure the ranking concentrates on highly linked regions.

Java

```
OCGraph.staticPageRank(
    "sales", "customers", "purchases",
    "sales", "pagerank_static",
    10,
    0.85,
    new ArrayList<>(List.of("id")),
    null,
    stmt
);
```

## dynamicPageRank

Computes PageRank scores until convergence based on a specified threshold value (`tolerance`). Unlike the **staticPageRank** method, this algorithm runs iterations until the sum of absolute differences between ranks in successive iterations is less than or equal to the `tolerance` value. The algorithm handles personalization similarly to

`staticPageRank`. At each iteration, the method uses the PageRank formula, collects rank values, and redistributes them.

The algorithm supports two variants:

- Standard PageRank — All vertices start with rank `1.0/N`, where `N` is the number of vertices. Specify this variant if `personalizationSrcId` is `null`.
- Personalized PageRank — The specified vertex starts with a rank of `1.0`, while others start with a rank of `0.0`. Specify this variant if `personalizationSrcId` is a vertex identifier.

After running PageRank until the system reaches the `tolerance` threshold, the method writes a vertices table containing all the original vertex columns with a new PageRank scoring column.

### Syntax

Java

```
dynamicPageRank(
    inputSchema,
    inputVerticesTable,
    inputEdgesTable,
    resultSchema,
    resultVerticesTable,
    tolerance,
    dampingFactor,
    [ resultVerticesIndexes [ , ... ] ],
    [ personalizationSrcId ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputVerticesTable` | String | Input vertices table (must have an `id` column). |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns). |

| Argument | Data Type | Description |
| --- | --- | --- |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultVerticesTable` | String | Name of the vertices table to create (columns include all vertex columns and `pagerank`). |
| `tolerance` | numeric | The convergence threshold that stops iterations when the rank changes become negligible.<br><br>After each iteration, the algorithm measures the maximum change in any rank of a vertex. If that change is below the specified tolerance, the algorithm considers the computation converged and stops early.<br><br>A high tolerance value (e.g., `0.001`) is good for quick exploratory runs that generate an approximate ranking.<br><br>A low tolerance value (e.g., `0.000001`) generates a precise ranking, but requires a higher compute cost. |
| `dampingFactor` | numeric | The damping factor, a value between `0.0` and `1.0`, that controls how the PageRank random surfer moves across vertices.<br><br>A high value (e.g., `0.85`) puts more emphasis on link structure, encouraging the algorithm to move from each vertex to a neighbor. The high value means PageRank scores tend to concentrate around well-linked regions.<br><br>A lower value (e.g., `0.50`) allows the algorithm to ignore edges and instead jump to a vertex chosen from a base distribution. For standard PageRank, this base is uniform over all vertices. For personalized PageRank, the base is biased toward the specified vertex. This behavior creates more uniform scoring with less sensitivity to link topology.<br><br>If this value is outside the range `0.0` to `1.0`, the function raises an error. |
| `resultVerticesIndexes` | ArrayList | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |
| `personalizationSrcId` | Long | Determines whether PageRank uses the standard or the personalized variant.<br><br>For personalized mode, specify a vertex identifier. PageRank scoring starts with this vertex set at `1.0`, while all other vertices start at `0.0`.<br><br>For standard mode, specify `null`. All vertices start with rank `1.0/N`, where `N` is the number of vertices. |

| Argument | Data Type | Description |
| --- | --- | --- |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

### Example

Run dynamic PageRank to convergence. This example uses a low `tolerance` value of `1.0e-6`, which generates high-precision rankings but requires more computing resources.

Java

```
OCGraph.dynamicPageRank(
    "sales", "customers", "purchases",
    "sales", "pagerank_dynamic",
    1.0e-6,
    0.85,
    new ArrayList<>(List.of("id")),
    null,
    stmt
);
```

## stableMarriage

Computes a stable matching between two groups using the **Gale–Shapley algorithm**. Each suitor proposes to candidates in order of preference, and each candidate tentatively holds the best proposal received. The algorithm iterates until no suitor can improve or until it reaches `maxIterations` rounds, producing a suitor-optimal stable matching.

The suitor preferences table must have the `suitor_id`, `candidate_id`, and `rank` columns. The candidate preferences table must have the `candidate_id`, `suitor_id`, and `rank` columns. All `rank` values must be non-NULL. The result table contains the `suitor_id` and `candidate_id` columns.

### Syntax

Java

```
stableMarriage(
    inputSchema,
    inputSuitorPrefsTable,
    inputCandidatePrefsTable,
    resultSchema,
    resultTable,
    maxIterations,
    [ resultIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputSuitorPrefsTable` | String | Suitor preferences table (must have `suitor_id`, `candidate_id`, and `rank` columns). |
| `inputCandidatePrefsTable` | String | Candidate preferences table (must have `candidate_id`, `suitor_id`, and `rank` columns). |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultTable` | String | Name of the result table to create (includes the `suitor_id` and `candidate_id` columns). |
| `maxIterations` | numeric | Maximum number of proposal rounds that must be `1` or greater. |
| `resultIndexes` | ArrayList | Optional. Columns to index in the result table (e.g., `suitor_id`). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

## Example

Compute a stable matching between suitors and candidates with a maximum of 20 rounds.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

Java

```
OCGraph.stableMarriage(
    "sales", "suitor_prefs", "candidate_prefs",
    "sales", "matches",
    20,
    new ArrayList<>(List.of("suitor_id")),
    stmt
);
```

## jaccardSimilarity

Computes the **Jaccard similarity** for every pair of vertices that share at least one neighbor. The Jaccard similarity between two vertices is the size of the intersection of their neighbor sets divided by the size of their union. This metric is useful for link prediction and duplicate detection.

The result table contains the `srcid`, `destid`, and `similarity` columns.

### Syntax

Java

```
jaccardSimilarity(
    inputSchema,
    inputEdgesTable,
    resultSchema,
    resultTable,
    [ resultIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns). |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultTable` | String | Name of the result table to create (includes the `srcid`, `destid`, and `similarity` columns). |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Argument | Data Type | Description |
| --- | --- | --- |
| `resultIndexes` | ArrayList | Optional. Columns to index in the result table (e.g., `srcid` and `destid`). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

### Example

Compute pairwise Jaccard similarity scores.

Java

```
OCGraph.jaccardSimilarity(
    "sales", "purchases",
    "sales", "jaccard_scores",
    new ArrayList<>(List.of("srcid","destid")),
    stmt
);
```

## cosineSimilarity

Computes the **cosine similarity** for every pair of vertices that share at least one neighbor. The cosine similarity represents the cosine of the angle between two neighbor-set vectors. This metric is useful for recommendation systems and measuring structural equivalence.

The result table contains the `srcid`, `destid`, and `similarity` columns.

### Syntax

Java

```
cosineSimilarity(
    inputSchema,
    inputEdgesTable,
    resultSchema,
    resultTable,
    [ resultIndexes [ , ... ] ],
    stmt
)
```

© 2026 Ocient, Inc

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns). |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultTable` | String | Name of the result table to create (includes the `srcid`, `destid`, and `similarity` columns). |
| `resultIndexes` | ArrayList | Optional. Columns to index in the result table (e.g., `srcid` and `destid`). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

### Example

Compute pairwise cosine similarity scores.

Java

```
OCGraph.cosineSimilarity(
    "sales", "purchases",
    "sales", "cosine_scores",
    new ArrayList<>(List.of("srcid","destid")),
    stmt
);
```

## kCoreDecomposition

Computes the **k-core decomposition** of a graph by iteratively removing vertices with degree less than `k` until only the maximal subgraph with the minimum degree `k` remains. The algorithm computes the coreness value for each vertex.

The result table contains the `id` and `core` columns.

### Syntax

Java

```
kCoreDecomposition(
    inputSchema,
    inputVerticesTable,
    inputEdgesTable,
    resultSchema,
    resultTable,
    [ resultIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputVerticesTable` | String | Input vertices table (must have an `id` column). |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns). |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultTable` | String | Name of the result table to create (includes the `id` and `core` columns). |
| `resultIndexes` | ArrayList | Optional. Columns to index in the result table (e.g., `id`). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

## Example

Compute k-core decomposition and index on the `id` column.

Java

```
OCGraph.kCoreDecomposition(
    "sales", "customers", "purchases",
    "sales", "kcore_result",
    new ArrayList<>(List.of("id")),
    stmt
);
```

## eigenvectorCentrality

Computes **eigenvector centrality** scores for each vertex by iteratively updating the score of each vertex to be the sum of the scores of its neighbors, followed by normalization. Vertices connected to other high-scoring vertices receive higher centrality.

The result table contains the `id` and `centrality` columns.

### Syntax

Java

```
eigenvectorCentrality(
    inputSchema,
    inputVerticesTable,
    inputEdgesTable,
    resultSchema,
    resultTable,
    numIterations,
    [ resultIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputVerticesTable` | String | Input vertices table (must have an `id` column). |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns). |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultTable` | String | Name of the result table to create (includes the `id` and `centrality` columns). |
| `numIterations` | numeric | Number of power-iteration rounds that must be `1` or greater. |
| `resultIndexes` | ArrayList | Optional. Columns to index in the result table (e.g., `id`). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

### Example

Compute eigenvector centrality with 20 iterations.

Java

```
OCGraph.eigenvectorCentrality(
    "sales", "customers", "purchases",
    "sales", "eigenvec_result",
    20,
    new ArrayList<>(List.of("id")),
    stmt
);
```

## cycleDetection

Detects vertices that participate in cycles in a directed graph using iterative degree-based peeling. The algorithm repeatedly removes vertices with an in-degree or out-degree of zero until no such vertices remain. The remaining vertices are those involved in at least one cycle.

The result table includes the `id` column for each vertex in a cycle.

### Syntax

Java

```
cycleDetection(
    inputSchema,
    inputVerticesTable,
    inputEdgesTable,
    resultSchema,
    resultTable,
    [ resultIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |

| Argument | Data Type | Description |
| --- | --- | --- |
| `inputVerticesTable` | String | Input vertices table (must have an `id` column). |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns). |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultTable` | String | Name of the result table to create (includes the `id` column). |
| `resultIndexes` | ArrayList | Optional. Columns to index in the result table (e.g., `id` ). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

### Example

Detect vertices involved in cycles.

Java

```
OCGraph.cycleDetection(
    "sales", "customers", "purchases",
    "sales", "cycle_vertices",
    new ArrayList<>(List.of("id")),
    stmt
);
```

## maxBipartiteMatching

Computes **maximum matching** in a bipartite graph using an iterative augmenting-path approach. The algorithm greedily matches unmatched vertices and then refines the matching until it finds no further augmenting path or until it reaches the number of rounds as specified by the `maxIterations` value. The result is a set of edges where no two edges share a vertex.

The result table contains the `srcid` and `destid` columns.

### Syntax

Java

```
maxBipartiteMatching(
    inputSchema,
    inputEdgesTable,
    resultSchema,
    resultTable,
    maxIterations,
    [ resultIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns). The graph must be bipartite, where the source and destination vertices must form two disjoint sets. |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultTable` | String | Name of the result table to create (includes the `srcid` and `destid` columns). |
| `maxIterations` | numeric | Maximum number of augmentation rounds that must be `1` or greater. |
| `resultIndexes` | ArrayList | Optional. Columns to index in the result table (e.g., `srcid` and `destid`). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

## Example

Compute a maximum bipartite matching with up to 10 augmentation rounds.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

Java

```
OCGraph.maxBipartiteMatching(
    "sales", "purchases",
    "sales", "bipartite_matches",
    10,
    new ArrayList<>(List.of("srcid","destid")),
    stmt
);
```

## louvainModularityOptimization

Detects communities using the **Louvain method**, a greedy modularity optimization algorithm. The algorithm iteratively moves vertices between communities to maximize modularity, then aggregates communities and repeats until modularity stops improving or until it reaches the number of rounds as specified by the `maxIterations` value.

The result table contains the `id` and `community` columns.

### Syntax

Java

```
louvainModularityOptimization(
    inputSchema,
    inputVerticesTable,
    inputEdgesTable,
    weightCol,
    resultSchema,
    resultTable,
    maxIterations,
    [ resultIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputVerticesTable` | String | Input vertices table (must have an `id` column). |

| Argument | Data Type | Description |
| --- | --- | --- |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns). |
| `weightCol` | String | The name of the edge weight column. Specify `null` for unweighted graphs. The default weight is `1.0`. |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultTable` | String | Name of the result table to create (includes the `id` and `community` columns). |
| `maxIterations` | numeric | Maximum number of iterations that must be `1` or greater. |
| `resultIndexes` | ArrayList | Optional. Columns to index in the result table (e.g., `id`). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

### Example

Detect communities using the Louvain method with a maximum of 10 iterations on an unweighted graph.

Java

```
OCGraph.louvainModularityOptimization(
    "sales", "customers", "purchases",
    null,
    "sales", "louvain_communities",
    10,
    new ArrayList<>(List.of("id")),
    stmt
);
```

## aggregateMessages

A general-purpose message-passing primitive that sends messages along edges and aggregates them at destination vertices. This function is useful for building custom graph computations, feature engineering, and implementing algorithms not available as built-in functions.

For each edge, the function evaluates a message expression referencing source vertex attributes ( `a.*` ), edge attributes ( `b.*` ), and destination vertex attributes ( `c.*` ). The function then aggregates the messages for each destination vertex using a SQL aggregation function.

The result table contains the vertex `id` and the aggregated message column, named using the `AS` alias in the `aggregateExpr` argument.

### Syntax

Java

```
aggregateMessages(
    inputSchema,
    inputVerticesTable,
    inputEdgesTable,
    messageExpr,
    aggregateExpr,
    resultSchema,
    resultTable,
    [ resultIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputVerticesTable` | String | Input vertices table (must have an `id` column). |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns). |
| `messageExpr` | String | A SQL expression defining the message to send along each edge. The expression can reference source vertex columns as `a.*` , edge columns as `b.*` , and destination vertex columns as `c.*` . Example: `"b.amount"` |
| `aggregateExpr` | String | A SQL aggregation expression that combines the messages arriving at each vertex. Reference the value produced by the `messageExpr` argument as `msg` , and name the result column with an `AS` alias. For a list of supported aggregations, see **Aggregate Functions**. Example: `"SUM(msg) AS total"` |

| Argument | Data Type | Description |
| --- | --- | --- |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultTable` | String | Name of the result table to create. |
| `resultIndexes` | ArrayList | Optional. Columns to index in the result table (e.g., `id`). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

### Example

Compute the sum of incoming edge weights for each vertex.

Java

```
OCGraph.aggregateMessages(
    "sales", "customers", "purchases",
    "b.amount",
    "SUM(msg) AS total_amount",
    "sales", "vertex_totals",
    new ArrayList<>(List.of("id")),
    stmt
);
```

## aStarShortestPath

Computes the shortest path between a source and target vertex using the **A* search algorithm**. A* extends Dijkstra's algorithm with a specified heuristic expression that estimates the remaining cost to the target, guiding the search toward the goal, reducing the number of vertices explored, and stopping early if it reaches the number of iterations as specified by the `maxIterations` value.

The heuristic must be admissible, meaning it never overestimates the true cost, for the algorithm to guarantee an optimal path. The result table contains the `srcid`, `destid`, `cost`, and `path_index` columns, which represent the ordered nodes on the shortest path.

### Syntax

Java

```
aStarShortestPath(
    inputSchema,
    inputVerticesTable,
    inputEdgesTable,
    sourceNodeId,
    targetNodeId,
    weightCol,
    heuristicExpr,
    resultSchema,
    resultTable,
    [ resultIndexes [ , ... ] ],
    maxIterations,
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputVerticesTable` | String | Input vertices table (must have an `id` column). |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns). |
| `sourceNodeId` | long | The vertex identifier of the source node. |
| `targetNodeId` | long | The vertex identifier of the target node. |
| `weightCol` | String | The name of the edge weight column. Specify `null` for unweighted graphs. The default weight is `1.0`. |
| `heuristicExpr` | String | A SQL expression that estimates the remaining cost from a vertex to the target. Reference vertex columns using the `v` alias, and substitute literal values for the target coordinates. For example, `"ABS(v.x - 10) + ABS(v.y - 20)"` is the Manhattan distance heuristic for the target at `(10, 20)`. |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultTable` | String | Name of the result table to create. |
| `resultIndexes` | ArrayList | Optional. Columns to index in the result table (e.g., `srcid` and `destid`). Specify an empty list for none. |

© 2026 Ocient, Inc

| Argument | Data Type | Description |
| --- | --- | --- |
| `maxIterations` | numeric | Maximum number of relaxation iterations that must be `1` or greater. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

### Example

Find the shortest path from vertex `1` to vertex `42` using edge weights and a coordinate-based heuristic.

Java

```
OCGraph.aStarShortestPath(
    "sales", "customers", "purchases",
    1L, 42L,
    "weight",
    "ABS(v.x - 10) + ABS(v.y - 20)",
    "sales", "astar_path",
    new ArrayList<>(List.of("srcid","destid")),
    100,
    stmt
);
```

## yensKShortestPaths

Computes the `k` shortest loopless paths between a source and target vertex using **Yen's algorithm**. The algorithm iteratively finds the next shortest path by deviating from previously discovered paths at each spur node, using up to the number of Dijkstra iterations as specified by the `maxIterations` value for each spur-node search.

The result table contains the `path_id`, `srcid`, `destid`, `cost`, and `path_index` columns, which represent the ordered nodes on each path.

### Syntax

Java

```
yensKShortestPaths(
    inputSchema,
    inputVerticesTable,
    inputEdgesTable,
    sourceNodeId,
    targetNodeId,
    k,
    weightCol,
    resultSchema,
    resultTable,
    [ resultIndexes [ , ... ] ],
    maxIterations,
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputVerticesTable` | String | Input vertices table (must have an `id` column). |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns). |
| `sourceNodeId` | long | The vertex identifier of the source node. |
| `targetNodeId` | long | The vertex identifier of the target node. |
| `k` | numeric | The number of shortest paths to find. This value must be `1` or greater. |
| `weightCol` | String | The name of the edge weight column. Specify `null` for unweighted graphs. The default weight is `1.0`. |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultTable` | String | Name of the result table to create. |
| `resultIndexes` | ArrayList | Optional. Columns to index in the result table (e.g., `path_id` and `srcid`). Specify an empty list for none. |
| `maxIterations` | numeric | Maximum number of Dijkstra iterations per sub-path that must be `1` or greater. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Argument | Data Type | Description |
| --- | --- | --- |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

### Example

Find the three shortest paths from vertex `1` to vertex `42` using edge weights.

Java

```
OCGraph.yensKShortestPaths(
    "sales", "customers", "purchases",
    1L, 42L,
    3,
    "weight",
    "sales", "yen_paths",
    new ArrayList<>(List.of("path_id","srcid")),
    100,
    stmt
);
```

## leidenModularityOptimization

Detects communities using the **Leiden algorithm**, a refinement of the Louvain method that guarantees the formation of well-connected communities. The algorithm optimizes modularity through iterative local moves and a refinement phase that prevents poorly connected communities, repeating until modularity stops improving or until it reaches the number of rounds as specified by the `maxIterations` value.

The result table contains the `id` and `community` columns.

### Syntax

Java

```
leidenModularityOptimization(
    inputSchema,
    inputVerticesTable,
    inputEdgesTable,
    weightCol,
    resolutionParam,
    resultSchema,
    resultTable,
    maxIterations,
    [ resultIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputVerticesTable` | String | Input vertices table (must have an `id` column). |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns). |
| `weightCol` | String | The name of the edge weight column. Specify `null` for unweighted graphs. The default weight is `1.0`. |
| `resolutionParam` | numeric | Resolution parameter controlling the granularity of communities. Higher values produce more communities. A typical value is `1.0`. |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultTable` | String | Name of the result table to create (includes the `id` and `community` columns). |
| `maxIterations` | numeric | Maximum number of iterations that must be `1` or greater. |
| `resultIndexes` | ArrayList | Optional. Columns to index in the result table (e.g., `id`). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

## Example

Detect communities using the Leiden algorithm with a resolution of `1.0` and a maximum of 10 iterations.

Java

```
OCGraph.leidenModularityOptimization(
    "sales", "customers", "purchases",
    "weight",
    1.0,
    "sales", "leiden_communities",
    10,
    new ArrayList<>(List.of("id")),
    stmt
);
```

## timeRespectingShortestPath

Computes the shortest path between a source and target vertex while respecting the temporal ordering of edges. Each edge has a timestamp, and the algorithm traverses only edges whose timestamps are nondecreasing along the path, modeling real-world scenarios where events must occur in chronological order.

The timestamp column must be of `TIMESTAMP` type. The result table contains the `srcid`, `destid`, `cost`, and `path_index` columns.

### Syntax

Java

```
timeRespectingShortestPath(
    inputSchema,
    inputVerticesTable,
    inputEdgesTable,
    sourceNodeId,
    targetNodeId,
    timeCol,
    weightCol,
    earliestDeparture,
    maxWaitTime,
    resultSchema,
    resultTable,
    [ resultIndexes [ , ... ] ],
    maxIterations,
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputVerticesTable` | String | Input vertices table (must have an `id` column). |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns). |
| `sourceNodeId` | long | The vertex identifier of the source node. |
| `targetNodeId` | long | The vertex identifier of the target node. |
| `timeCol` | String | The name of the `TIMESTAMP` column on edges representing the event time. |
| `weightCol` | String | The name of the edge weight column. Specify `null` for unweighted graphs. The default weight is `1.0`. |
| `earliestDeparture` | String | A `TIMESTAMP` literal specifying the earliest allowed departure time from the source, without SQL quotes. Example: `"2024-01-01 00:00:00"` |
| `maxWaitTime` | Integer | Optional. Maximum waiting time in seconds at any vertex. Specify `null` to wait indefinitely. |
| `resultSchema` | String | A writable schema to create the result tables. |

| Argument | Data Type | Description |
| --- | --- | --- |
| `resultTable` | String | Name of the result table to create. |
| `resultIndexes` | ArrayList | Optional. Columns to index in the result table (e.g., `srcid` and `destid`). Specify an empty list for none. |
| `maxIterations` | numeric | Maximum number of relaxation iterations that must be `1` or greater. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

### Example

Find the time-respecting shortest path from vertex `1` to vertex `42` departing no earlier than midnight on January 1, 2024.

Java

```
OCGraph.timeRespectingShortestPath(
    "sales", "customers", "purchases",
    1L, 42L,
    "event_time",
    "weight",
    "2024-01-01 00:00:00",
    null,
    "sales", "trsp_path",
    new ArrayList<>(List.of("srcid","destid")),
    100,
    stmt
);
```

## temporalPageRank

Computes **PageRank** scores using exponential time decay on edges. Recent edges contribute more to the ranking than older edges, making this algorithm suitable for graphs where recency matters (e.g., communication networks, transaction logs).

The time column must be of `TIMESTAMP` type. The algorithm supports both standard and personalized variants, similar to **staticPageRank**.

### Syntax

Java

```
temporalPageRank(
    inputSchema,
    inputVerticesTable,
    inputEdgesTable,
    timeCol,
    decayFactor,
    referenceTime,
    resultSchema,
    resultVerticesTable,
    numIterations,
    dampingFactor,
    [ resultVerticesIndexes [ , ... ] ],
    [ personalizationSrcId ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputVerticesTable` | String | Input vertices table (must have an `id` column). |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns). |
| `timeCol` | String | The name of the `TIMESTAMP` column on edges. |
| `decayFactor` | numeric | Controls the rate of exponential decay. A higher value causes older edges to lose influence faster. |
| `referenceTime` | String | A `TIMESTAMP` literal specifying the reference point for computing time differences, without SQL quotes. Example: `"2024-12-31 23:59:59"` |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultVerticesTable` | String | Name of the vertices table to create (columns include all vertex columns and a `pagerank` column). |
| `numIterations` | numeric | Number of iterations to run that must be `1` or greater. |
| `dampingFactor` | numeric | The damping factor, specified as a value between `0.0` and `1.0`. For details, see **staticPageRank**. |
| `resultVerticesIndexes` | ArrayList | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |

| Argument | Data Type | Description |
| --- | --- | --- |
| `personalizationSrcId` | Long | For the personalized mode, specify a vertex identifier. For the standard mode, specify `null`. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

### Example

Run temporal PageRank with a decay factor of `0.5` using a reference time of December 31, 2024.

Java

```
OCGraph.temporalPageRank(
    "sales", "customers", "purchases",
    "event_time",
    0.5,
    "2024-12-31 23:59:59",
    "sales", "temporal_pr",
    10,
    0.85,
    new ArrayList<>(List.of("id")),
    null,
    stmt
);
```

## randomWalk

Generates configurable random walks from each vertex using **Node2Vec**-style biased sampling. The return parameter ( `pReturn` argument) and in-out parameter ( `qInout` argument) control whether the walk favors revisiting the previous node (breadth-first) or exploring further (depth-first).

The result table contains the `walk_id` , `step` , and `node_id` columns.

### Syntax

Java

```
randomWalk(
    inputSchema,
    inputVerticesTable,
    inputEdgesTable,
    walkLength,
    numWalksPerNode,
    pReturn,
    qInout,
    resultSchema,
    resultTable,
    [ resultIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputVerticesTable` | String | Input vertices table (must have an `id` column). |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns). |
| `walkLength` | numeric | Length of each random walk (number of steps). |
| `numWalksPerNode` | numeric | Number of walks to generate from each vertex. |
| `pReturn` | numeric | Return parameter, where a lower value makes the walk more likely to return to the previous node (breadth-first behavior). |
| `qInout` | numeric | In-out parameter, where a lower value makes the walk more likely to explore further from the previous node (depth-first behavior). |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultTable` | String | Name of the result table to create (includes the `walk_id`, `step`, and `node_id` columns). |
| `resultIndexes` | ArrayList | Optional. Columns to index in the result table (e.g., `walk_id`). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

### Example

Generate five random walks of length 10 from each vertex using Node2Vec-style parameters.

```java
OCGraph.randomWalk(
    "sales", "customers", "purchases",
    10,
    5,
    1.0,
    1.0,
    "sales", "walks",
    new ArrayList<>(List.of("walk_id")),
    stmt
);
```

## fastRandomProjection

Generates node embeddings using the **Fast Random Projection** (FastRP) algorithm. FastRP creates low-dimensional vector representations of vertices by iteratively averaging neighbor embeddings with sparse random projections. These embeddings are useful as features for downstream machine learning tasks.

The result table contains the `id` and `embedding` columns. The `embedding` column is a vector with length equal to the `embeddingDim` value.

### Syntax

© 2026 Ocient, Inc

Java

```
fastRandomProjection(
    inputSchema,
    inputVerticesTable,
    inputEdgesTable,
    embeddingDim,
    iterations,
    normalize,
    resultSchema,
    resultTable,
    [ resultIndexes [ , ... ] ],
    stmt
)
```

| Argument | Data Type | Description |
|---|---|---|
| `inputSchema` | String | A non-empty schema containing the input tables. |
| `inputVerticesTable` | String | Input vertices table (must have an `id` column). |
| `inputEdgesTable` | String | Input edges table (must have the `srcid` and `destid` columns). |
| `embeddingDim` | numeric | Dimensionality of the output embedding vectors. |
| `iterations` | numeric | Number of neighbor-averaging iterations. Higher values capture more distant structural information. |
| `normalize` | boolean | If you set this argument to `true`, the function scales each embedding vector to unit length using the L2 norm. |
| `resultSchema` | String | A writable schema to create the result tables. |
| `resultTable` | String | Name of the result table to create (includes the `id` and `embedding` columns). |
| `resultIndexes` | ArrayList | Optional. Columns to index in the result table (e.g., `id`). Specify an empty list for none. |
| `stmt` | java.sql.Statement | JDBC statement for executing SQL. You must have a valid statement and a database connection. |

## Example

Generate 64-dimensional normalized embeddings with three iterations.

Java

```
OCGraph.fastRandomProjection(
    "sales", "customers", "purchases",
    64,
    3,
    true,
    "sales", "embeddings",
    new ArrayList<>(List.of("id")),
    stmt
);
```

# Ocient Python Module: pyocient

Use the pyocient Python module to connect to an Ocient System, execute SQL queries, fetch results as Python objects, and integrate Ocient into data workflows.

The Ocient® pyocient Python® module supports direct connections to the Ocient System through a command line interface (CLI) as well as Python programs that follow the **Python Database API Specification 2.0.** To download, install, and use the pyocient CLI, see **Connect Using pyocient**.

The pyocient package has these supported features and functionality.

## Prerequisites

To use the pyocient client, you should have this software with the corresponding version installed.

| Software | Version |
|---|---|
| Ocient | All Ocient versions are supported. |
| OS | Windows®, Linux®, or macOS®. Use the latest version of each OS system. |
| Python | Version 3.8 or later. |

## Module Features

The pyocient connector supports these features as of the current version.

| Unicode Support | UTF-8 |
|---|---|
| Isolation Levels | Read committed. The pyocient module supports multi-statement transactions using the connection **autocommit** attribute and the **commit()** and **rollback()** methods. |
| Data Types | Supports all Ocient **Data Types**. |
| Security / Encryption | GCM, CBC, and SSO protocols are supported.<br>TLS protocol is optional as a setting. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

The pyocient module supports multi-statement transactions. By default, a connection uses autocommit mode, in which the database commits each statement immediately. To group several statements into a single transaction, set the connection **autocommit** attribute to `False`, and then complete the transaction with **commit()** or **rollback()**.

> The HTTP Query API does not support transactions. To use transactions, connect to the Ocient System with the pyocient module or the Ocient JDBC driver.

> The Apache® Spark™ Connector supports transactions and performs the commit and rollback actions automatically. When you use the Spark Connector, you do not need to call `commit()` or `rollback()` methods.

# pyocient CLI

You can make a connection by invoking the pyocient module in a command-line interface with a connection string using this syntax.

### Syntax

Shell

```
$ pyocient [named_arguments] dsn [sql]
```

For details on the parts of a connection string, see these sections.

- **Connecting Using a DSN**
- **Using SQL Queries in the CLI**
- **Using Named Arguments**
- **Additional pyocient CLI Commands**

## Connect Using a DSN

Required. A Data Source Name (DSN) supplies the user credentials, host, port, and database to establish a connection. This string can also include various optional parameters.

### Syntax

Shell

```
ocient://<user>:<password>@<host>:[<port>][/<database>][?<parameters>[&...]]
```

A DSN consists of these arguments.

| Argument | Definition |
|---|---|
| `<user>` | Required. An Ocient username. |
| `<password>` | Required. The password associated with your username for connection to Ocient. |
| `<host>` | Required. The Ocient host address.<br>You can specify multiple hosts if they are separated by commas. The system attempts to connect to multiple hosts in order, starting with the leftmost host. For example, `host1` is the first for the connection attempt in this case: `ocient://someone:somepassword@host1,host2:4051/mydb` |
| `<port>` | The port number used by your host.<br>The default is `4050`. |
| `<database>` | The name of the database for the connection.<br>The default is `system`. |
| `<parameters>` | One or more optional parameters for the connection in the format `parameter=value`.<br>Supported parameters include:<br>`tls`: TLS protocol security. You can set the value to `off`, `unverified`, or `on`. The default is `off`.<br>`force`: Values are `true` or `false`. If you set this value to `true`, this argument forces the connection to stay on this server. The default is `false`.<br>`handshake`: Security handshake protocol. Supported values include `cbc`. By default, the system does not use `cbc`.<br>`identityprovider`: An SSO integration established in the database. For details, see **CREATE SSO INTEGRATION**.<br>`ssoOAuthFlow`: This parameter is only applicable if SSO authorization is enabled. Forces the driver to use either the `authorizationCode` or `deviceGrant` flow to establish a Single Sign-On session. If you do not specify this parameter, the system uses the `authorizationCode` flow when a web browser is available to the client and the `deviceGrant` flow when a web browser is not available to the client. |

### DSN Example

When you successfully connect with a DSN, your command line switches to interactive mode.

Shell

```
$ pyocient ocient://user:password@myhost:4050/mydb?tls=on&force=true
Ocient Database™
System Version: 22.0, Client Version 1.0.13
>
```

In interactive mode, you can enter SQL commands and queries directly at the command line. This example shows a simple `SELECT` query that you enter at the command line.

Shell

```
> SELECT * FROM my_table LIMIT 1;
[
    {
        "time_x": "2022-06-15T13:31:42.824000",
        "col_001": 1.0,
        "col_002": 2.0,
        "col_003": 3,
        "col_004": 4,
        "keyid": 5
    }
]
```

## SQL Queries in the Connection String

Instead of executing queries and commands in the CLI, you can also include SQL scripts directly in your connection string.

A connection string can contain multiple queries as long as each is delineated by semicolons.

You must enclose any SQL statements in a connection string in quotes and specify the statements after the DSN portion.

### Example

This example shows a SQL query embedded in a pyocient connection string. The query processes and returns its values without launching the interactive mode.

Shell

```
$ pyocient ocient://user:password@myhost:4050/mydb?tls=on&force=true "SELECT * FROM

[
    {
        "time_x": "2022-06-15T13:31:42.824000",
        "col_001": 1.0,
        "col_002": 2.0,
        "col_003": 3,
        "col_004": 4,
        "keyid": 5
    }
]
```

## Use Optional Named Arguments

You can add these optional arguments to a connection string.

Shell

```
[-h] [-o OUTFILE | -n] [-c CONFIGFILE | --noconfig]
[-i INFILE] [-l {critical,error,warning,info,debug}]
[--logfile LOGFILE] [-t] [--format {json | table | csv}]
[--nocolor]
```

### Named Argument Definitions

| Named Argument | Definition |
|---|---|
| `-o \| --outfile OUTFILE` | pyocient records all SQL output to a specified output file.<br>You must also include the file path to the output file, enclosed in quotation marks.<br>The Ocient System saves output values to the file after query completion. |
| `-n \| --noout` | Prevent all output results. |
| `-c \| --configfile CONFIGFILE` | Direct pyocient to use a configuration file.<br>You must include the path location and name of the configuration file, enclosed in quotation marks. |
| `--noconfig` | Direct pyocient not to use a configuration file. |

| Named Argument | Definition |
| --- | --- |
| `-i \| --infile INFILE` | Direct pyocient to use an input file that contains SQL statements. |
| `-l \| --loglevel LOGLEVEL` | Sets the logging level.<br>Logging level options include: `CRITICAL \| ERROR \| WARNING \| INFO \| DEBUG`<br>Defaults to `CRITICAL`.<br>For details, see **Log Monitoring**. |
| `--logfile LOGFILE` | Direct pyocient to record log events in a specified log file.<br>You must include the path location and name of the log file, enclosed in quotation marks. |
| `-t, --time` | pyocient outputs the execution time for all queries and commands. |
| `-f, --format` | Specifies the output format for all SQL queries.<br>Format options include: `JSON \| TABLE \| CSV`<br>`JSON` — JavaScript® Object Notation.<br>`TABLE` — A table rendered in ASCII characters.<br>`CSV` — Comma-separated values format.<br>The default value is `JSON`. |
| `--nocolor` | When you use pyocient in interactive mode, the interface does not color SQL keywords. |

## Additional pyocient CLI Commands

When running in a CLI, pyocient recognizes these commands in addition to the SQL statements and queries.

| Command | Description |
| --- | --- |
| `CONNECT TO <dsn> USER <username> USING <password>;` | Allows switching to a different DSN or user during an interactive session.<br>The DSN must be enclosed in quotation marks. Otherwise, the command follows the normal format explained in **Connect Using a DSN**.<br>You can specify the username and password either in the DSN string or with the `USER` and `USING` keywords. |
| `SOURCE '<file>';` | Executes the input statements from the specified file. The filename must be in single quotes. |
| `SET FORMAT TABLE;` | Sets the output format. Format options include `JSON`, `TABLE`, and `CSV`.<br>Defaults to `JSON`.<br>`JSON` — JavaScript Object Notation.<br>`TABLE` — A table rendered in ASCII characters.<br>`CSV` — Comma-separated values format. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Command | Description |
| --- | --- |
| `QUIT;` | Quits the CLI.<br>Alternatively, you can exit the interface by using `Ctrl + D`. |

## Run a Transaction in the pyocient CLI

The pyocient CLI runs two scripts on a single connection with the `-i` argument. To run multiple statements in one transaction, use the `SET AUTOCOMMIT OFF` statement, and then end the transaction with the `COMMIT` or `ROLLBACK` statement. Because each invocation uses one connection, include all statements of the transaction in a single input file.

The `txn_commit.sql` example script inserts multiple rows into the `public.txn_demo` table, confirms the row count with a query that reads its own uncommitted writes, and then commits the transaction.

SQL

```sql
SET AUTOCOMMIT OFF;
INSERT INTO public.txn_demo VALUES (1, 'alpha');
INSERT INTO public.txn_demo VALUES (2, 'beta');
SELECT count(*) AS n_in_txn FROM public.txn_demo;
COMMIT;
```

The `txn_rollback.sql` example script inserts multiple rows into the `public.txn_demo` table, confirms the row count, and then rolls back the transaction, discarding the inserted rows. The example confirms the discard using another row-count query.

SQL

```sql
SET AUTOCOMMIT OFF;
INSERT INTO public.txn_demo VALUES (3, 'gamma');
INSERT INTO public.txn_demo VALUES (4, 'delta');
SELECT count(*) AS n_in_txn FROM public.txn_demo;
ROLLBACK;
SELECT count(*) AS n_after_rollback FROM public.txn_demo;
```

Run each script with the `-i` argument.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

Shell

```
pyocient "ocient://user:password@myhost:4050/mydb?tls=unverified" -i txn_commit.sql
pyocient "ocient://user:password@myhost:4050/mydb?tls=unverified" -i txn_rollback.s
```

# pyocient API

This Python database API conforms to the **Python Database API Specification 2.0**, and you can use it to access the Ocient System.

You can also execute this module as a main function, in which case it acts as a primitive CLI for the database.

When you execute this module as a main function, the API takes a connection string in the DSN format. The connection string can also include one or more query strings that execute. For information on using a DSN to connect, see **Connect Using a DSN**.

The API returns output in JSON format by default.

The database returns any warnings and sends them to the Python warnings module. By default, that module sends warnings to standard output, however, you can change the behavior by using that module.

## pyocient.Connection

### Constructor

Python

```
class pyocient.Connection(
    dsn=None, user=None, password=None,
    host=None, database=None, tls=None,
    handshake=None, identityprovider=None,
    force=None, configfile=None, session=None)
```

A connection to Ocient. This class is normally constructed by executing the module `connect()`, but you can also construct it directly.

You can specify connection parameters using the `dsn` argument, other keyword arguments, or a mix of both. If the system receives multiple arguments for the same parameters, the keyword arguments take precedence and override the `dsn` value.

Definitions for the connection parameters are listed in **Connect Using a DSN section**. Other parameters are:

- `configfile` — The name of a configuration file in .ini format, where each section either uses default connection settings or a pattern that matches the host or database. Sections are matched in order, so highly detailed sections should precede less detailed sections.
- `session` — A string of an SSO security token.

This code provides an example of an `.ini` configuration file.

INI

```ini
[DEFAULT]
tls = unverified

; This matches the specific host and database.
[foo.ocient.com/somedb]
user = panther
password = pink

; This matches the specific host.
[foo.ocient.com]
user = panther
password = pink

; This matches any host in the ocient.com domain.
[*.ocient.com]
user = tom
password = jerry
database = mice

; This matches any host in the ocient.com domain using the default database.
[*.ocient.com]
user = tom
password = jerry
```

The currently supported parameter is:

`tls` — The values are `on`, `off`, or `unverified` in the DSN. You can also set TLS by using `Connection.TLS_NONE`, `Connection.TLS_UNVERIFIED`, or `Connection.TLS_ON` as a keyword parameter.

## Connection Object Methods

### autocommit

Controls the autocommit mode for the connection. When you set this method to `True`, the database commits each statement immediately. This mode is the default value. When you set this attribute to `False`, the database groups statements into a transaction that you complete by calling **commit()** or **rollback()**.

When you change the value from `False` to `True`, the database commits any pending transaction.

This example disables autocommit mode for a connection.

Python

```
connection.autocommit = False
```

### close()

Close the connection. Any subsequent queries on the closed connection fail.

### commit()

Commit the pending transaction and permanently save all changes made after the transaction started. This method has an effect only when the `autocommit` method value is `False`.

### cursor()

Return a new cursor object for this connection.

### rollback()

Roll back the pending transaction and discard all changes made after the transaction started. This method has an effect only when the `autocommit` method value is `False`.

## pyocient.Cursor

### Constructor

Python

```
class pyocient.Cursor(conn)
```

A database cursor that can manage a query and its returned results.

Cursors are normally created by executing `cursor()` on a connection, but you can also create them directly by providing a connection.

## Cursor Object Methods

### close()

Close this cursor. The current result set is closed, but you can reuse the cursor for subsequent `execute()` calls.

### execute(operation, parameters=None)

Prepare and execute a database operation (query or command).

Parameters might be provided as a mapping and are bound to variables in the operation. Variables are specified in Python extended format codes, for example: `WHERE name=%(name)`

### executemany(operation, parameterlist)

Prepare a database operation (query or command) and then execute it against all parameter sequences or mappings found in the sequence `parameterlist`.

Parameters might be provided as a mapping and are bound to variables in the operation. Variables are specified in Python extended format codes, for example: `WHERE name=%(name)`

© 2026 Ocient, Inc

### fetchone()

Fetch the next row of a query result set. The function returns a single row or `None` when no more data rows are available.

### fetchmany(size=None)

Fetch the next set of rows of a query result and return a sequence of sequences as a list of tuples. The database returns an empty sequence when no more rows are available.

The number of rows to fetch per call is specified by the `size` parameter. If this parameter is not specified, the array size of the cursor determines the number of rows to fetch. The method tries to fetch as many rows as indicated by the size parameter. If this is not possible due to the specified number of rows not being available, the function returns fewer rows.

### fetchall()

Fetch all (remaining) rows of a query result and return them as a sequence of sequences (e.g., a list of tuples). Note that the array size attribute of the cursor can affect the performance of this operation.

### arraysize

This read-and-write attribute specifies the number of rows to fetch at a time with **fetchmany**. The default value is `1`, meaning the attribute fetches a single row at a time.

### tables(schema='%', table='%')

Retrieve the database tables. By default, the database returns all tables.

### system_tables(table='%')

Retrieve the database system tables.

### views(view='%')

Retrieve the database views.

### columns(schema='%', table='%', column='%')

Retrieve the database columns.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

## indexes(schema='%', table='%')

Retrieve the database indexes.

## getTypeInfo()

Retrieve the database type information.

## fetchval()

The fetchval() convenience method returns the first column of the first row if there are results, otherwise it returns `None`.

## resolve_new_endpoint(new_host, new_port)

Handles mapping to a secondary interface based on the secondary interface mapping saved on this connection.

### Arguments:

```
Text
new_host[string]: the new host to be remapped
new_port[int]: the new port to be remapped
```

### Returns:

```
Text
[tuple(string, int)]: The actual endpoint to connect to in the format: (host, port)
```

## redirect(new_host, new_port)

Redirects to the proper secondary interface with a new endpoint.

### Arguments:

```
Text
new_host[string]: the new host to be redirected
new_port[int]: the new port to be redirected
```

© 2026 Ocient, Inc

**Returns:**

```
[Connection]: A new connection.
```

### refresh()

Refresh the session associated with this connection. The server returns a new server session identifier and security token.

### setinputsizes(sizes)

Used before an **execute** call to set memory sizes for the specified operation.

For details on usage, see the **Python API documentation**.

### setoutputsize(size [, column])

Used before an **execute** call to set a column buffer size for fetches of columns with large data types, such as LONG, BLOB, etc.

For details on usage, see the **Python API documentation**.

## Type Objects and Constructors

These constructors create objects to hold special values to comply with defined types in a database schema. When you pass these objects to the cursor methods, the module detects the proper type of input parameter and binds it accordingly.

For details, see the Python documentation on **Type Objects and Constructors**.

### Date(*year*, *month*, *day*)

This function constructs an object that holds a date value.

### Time(*hour*, *minute*, *second*)

This function constructs an object that holds a time value.

### Timestamp(*year*, *month*, *day*, *hour*, *minute*, *second*)

This function constructs an object that holds a timestamp value.

### DateFromTicks(*ticks*)

This function constructs an object that holds a date value from the specified ticks value (number of seconds after the epoch; see the documentation of **the standard Python time module** for details).

### TimeFromTicks(*ticks*)

This function constructs an object that holds a time value from the specified ticks value (number of seconds after the epoch; see the documentation of the standard Python time module for details).

### TimestampFromTicks(*ticks*)

This function constructs an object that holds a timestamp value from the specified ticks value (number of seconds after the epoch; see the documentation of the standard Python time module for details).

### Binary(*string*)

This function constructs an object capable of holding a binary (long) string value.

### STRING type

This type object describes columns in a database that are string-based (e.g., `CHAR`).

### BINARY type

This type object describes (long) binary columns in a database (e.g., `LONG`, `RAW`, `BLOB`).

### NUMBER type

This type object describes numeric columns in a database.

### DATETIME type

This type object describes date and time columns in a database.

### ROWID type

This type object describes the “Row ID” column in a database.

## Exceptions

### Error

Exception that is the base class of all other error exceptions.

```
Text
exception Error(reason, sql_state='58005', vendor_code=-100)
```

### Warning

Exception that is the base class of all other warning exceptions.

```
Text
exception Warning(reason='', sql_state='00000', vendor_code=0)
```

### InterfaceError

Exception raised for errors related to the database interface rather than the database itself.

```
Text
exception InterfaceError(reason, sql_state='58005', vendor_code=-100)
```

### DatabaseError

Exception raised for errors that are related to the database.

```
Text
exception DatabaseError(reason, sql_state='58005', vendor_code=-100)
```

### InternalError

© 2026 Ocient, Inc

Exception raised when the database encounters an internal error, e.g., the cursor is not valid anymore.

```
Text

exception InternalError(reason, sql_state='58005', vendor_code=-100)
```

### OperationalError

Exception raised for errors related to the operation of the database and not necessarily under the control of the programmer, e.g., an unexpected disconnect occurs, the data source name is not found, etc.

```
Text

exception OperationalError(reason, sql_state='58005', vendor_code=-100)
```

### ProgrammingError

Exception raised for programming errors, e.g., table not found, syntax error in the SQL statement, wrong number of parameters specified, etc.

```
Text

exception ProgrammingError(reason, sql_state='58005', vendor_code=-100)
```

### IntegrityError

Exception raised when the relational integrity of the database is affected, e.g., a foreign key check fails.

```
Text

exception IntegrityError(reason, sql_state='58005', vendor_code=-100)
```

### DataError

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

Exception raised for errors due to problems with the processed data like division by zero, numeric value out of range, etc.

```
Text
exception DataError(reason, sql_state='58005', vendor_code=-100)
```

#### NotSupportedError

Exception raised when a method or database API that is not supported by the database is used.

```
Text
exception NotSupportedError(reason, sql_state='58005', vendor_code=-100)
```

## Optional DB API Extensions

### Cursor.rownumber

This read-only attribute should provide the current 0-based index of the cursor in the result set or `None` if the index cannot be determined.

You can see the index as the index of the cursor in a sequence (the result set). The next fetch operation fetches the row indexed by **.rownumber** in that sequence.

### Connection.Error, Connection.ProgrammingError, etc.

All exception classes defined by the DB API standard should be exposed on the **Connection** objects as attributes (in addition to being available at module scope).

These attributes simplify error handling in multi-connection environments.

### Cursor.connection

This read-only attribute returns a reference to the **Connection** object on which the cursor was created.

The attribute simplifies writing polymorph code in multi-connection environments.

### Cursor.__iter__()

Return self to make cursors compatible with the Python iteration protocol.

## Transaction pyocient API Example

To run multiple statements in a single transaction with the pyocient API, set the connection **autocommit** attribute to `False`, and then call the **commit()** or **rollback()** methods. For transactions, autocommit mode is on by default. Ensure that you execute SQL statements that are supported by transactions. Otherwise, the database throws an error. For a list of supported statements, see **Transactions**.

The example code establishes a connection and creates the `txn_demo` table. Then, the example inserts two rows, commits the transaction, and verifies the row count. This example continues to insert two more rows and verify the row count. The code then calls the rollback method and verifies the row count to ensure that the rollback action is successful. The example resets the autocommit mode for other transactions.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

Python

```python
import pyocient

conn = pyocient.connect(
    host="myhost:4050",
    user="user", password="password",
    database="mydb", tls="unverified",
)

def count(label):
    cur = conn.cursor()
    cur.execute("SELECT count(*) AS n FROM public.txn_demo")
    print(f"{label} -> {cur.fetchone()[0]}")
    cur.close()

# DDL must run outside a transaction (autocommit is on by default)
cur = conn.cursor()
cur.execute("DROP TABLE IF EXISTS public.txn_demo")
cur.execute("CREATE TABLE public.txn_demo (id INT, v VARCHAR(64))")
cur.close()

# Transaction 1: execute multiple inserts, then commit
conn.autocommit = False
cur = conn.cursor()
cur.execute("INSERT INTO public.txn_demo VALUES (1, 'alpha')")
cur.execute("INSERT INTO public.txn_demo VALUES (2, 'beta')")
count("T1 in-txn (read-your-writes, expect 2)")
conn.commit()
count("T1 after commit() (expect 2)")

# Transaction 2: execute multiple inserts, then rollback
cur.execute("INSERT INTO public.txn_demo VALUES (3, 'gamma')")
cur.execute("INSERT INTO public.txn_demo VALUES (4, 'delta')")
count("T2 in-txn (expect 4)")
conn.rollback()
count("T2 after rollback() (expect 2)")

conn.autocommit = True   # commits any open work
conn.close()
```

# OCGraph Python Library

OCGraph Python provides a SQL-native interface for graph analytics on Ocient using a Python workflow, with function references, parameter tables, and examples.

The `ocient_graph` module brings a programming model (similar to Apache® Spark™ GraphX) to the Ocient® System directly from Python® using the `pyocient` driver. The module treats a graph as two relational tables, one for vertices (nodes) and one for edges (directed links). This module provides a composable API for graph transformations, neighborhood analytics, and iterative algorithms (e.g., Pregel, PageRank).

The API validates inputs, avoids destructive changes by materializing results into new tables, supports optional indexing for performance, and follows Ocient SQL conventions. The package installs separately from `pyocient` and exposes a Python-native interface that mirrors the Java® library. For details, see **OCGraph Java Library**.

## Installation

Use `pyocient` for connectivity and `ocient_graph` for graph APIs. The graph library is a separate package that depends on `pyocient`. For a tutorial about installing and using `pyocient`, see **Ocient Python Module: pyocient**.

### Install and Import

Install the `ocient_graph` module.

Shell

```
pip install ocient_graph
```

Import the module.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

Python

```python
from pyocient import connect
from ocient_graph import (
    subgraph,
    collect_neighbors,
    EdgeDirection,
)
```

## Data Model Requirements

Database tables that use the OCGraph Python library must adhere to this structure. In addition to the listed requirements, tables can include other columns.

| Table | Description | Requirements |
|---|---|---|
| Vertices table | A table with one row per vertex (node). This table typically represents the anchor for graph algorithms and transforms. Many methods join edges to vertices by the `id` column. | The table must contain the `id BIGINT NOT NULL` column definition as the unique vertex identifier. |
| Edges table | A table with one row per directed edge (relationship). Each row is a directed edge from a source vertex to a destination vertex. | The table must contain these column definitions: `srcid BIGINT NOT NULL`, `destid BIGINT NOT NULL` |

## Execution Mode

The OCGraph Python library supports two execution backends for graph algorithms: legacy and data flow. All algorithms prefer the data flow backend when the server supports it. You can override this default globally using the `set_execution_config` function.

The `ExecutionMode` enum defines the available modes.

| Mode | Description |
|---|---|
| `ExecutionMode.ALWAYS_LEGACY` | Forces all algorithms to use the legacy SQL execution backend. |
| `ExecutionMode.ALWAYS_DATAFLOW` | Forces all algorithms to use the data flow execution backend. If the server does not support data flows, the function raises a `DatabaseError` error. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Mode | Description |
| --- | --- |
| `ExecutionMode.AUTO_FASTEST` | Selects the backend for each algorithm automatically, based on whether the server supports data flows. This mode is the default. |

### Syntax

Python

```
from ocient_graph import set_execution_config, ExecutionMode

set_execution_config(mode)
```

### Examples

### Set the Data Flow Mode

Force all algorithms to run in data flow mode.

Python

```
set_execution_config(ExecutionMode.ALWAYS_DATAFLOW)
```

### Reset to the Default Mode

Reset to the default automatic mode.

Python

```
set_execution_config(ExecutionMode.AUTO_FASTEST)
```

## Subgraph and Filtering

Use a subgraph or various filters to restrict a graph to relevant vertices and edges. These functions create filtered copies or masked intersections, preserving schema and optional indexes for performance.

### subgraph

Creates filtered vertex and edge tables using vertex and triplet predicates, retaining only edges with endpoints that remain after vertex filtering. The function creates the requested indexes and performs best-effort cleanup in the event of failure.

### Syntax

Python

```
subgraph(
    connection,
    input_schema,
    input_vertices_table,
    input_edges_table,
    result_schema,
    result_vertices_table,
    result_edges_table,
    vertex_filter,
    edge_filter,
    [ result_vertices_indexes [ , ... ] ],
    [ result_edges_indexes [ , ... ] ]
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input tables. |
| `input_vertices_table` | str | Input vertices table (must have an `id` column). |
| `input_edges_table` | str | Input edges table (must have `srcid` and `destid` columns). |
| `result_schema` | str | A writable schema to create the result tables. |
| `result_vertices_table` | str | Name of the filtered vertices table to create. |
| `result_edges_table` | str | Name of the filtered edges table to create. |
| `vertex_filter` | str | SQL predicate to filter the vertices (without the `WHERE` keyword). Example: `status = 'ACTIVE' AND score > 0` |
| `edge_filter` | str | SQL predicate that the system evaluates in a triplet context using the aliases `a` (source vertex), `b` |

| Argument | Data Type | Description |
| --- | --- | --- |
| | | (edge), and `c` (destination vertex). This predicate does not require a `WHERE` keyword. Example: `b.amount > 50 AND a.region = c.region` |
| `result_vertices_indexes` | List[str] | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |
| `result_edges_indexes` | List[str] | Optional. Columns to index in the result edges table (e.g., `srcid` and `destid` columns). Specify an empty list for none. |

**Example** Create an active customer subgraph that includes only purchases exceeding $50 where the source and destination share a region.

Python

```
subgraph(
    connection,
    "sales",
    "customers",
    "purchases",
    "sales",
    "customers_active",
    "purchases_active",
    "status = 'ACTIVE' AND score > 0",
    "b.amount > 50 AND a.region = c.region",
    ["id","region"],
    ["srcid","destid"],
)
```

## filter_vertices

Creates a filtered subgraph by selecting vertices that match a predicate while retaining only edges with endpoints that are in the filtered vertex set.

### Syntax

Python

```
filter_vertices(
    connection,
    input_schema,
    input_vertices_table,
    input_edges_table,
    result_schema,
    result_vertices_table,
    result_edges_table,
    vertex_filter,
    [ result_vertices_indexes [ , ... ] ],
    [ result_edges_indexes [ , ... ] ]
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input tables. |
| `input_vertices_table` | str | Input vertices table (must have an `id` column). |
| `input_edges_table` | str | Input edges table (must have `srcid` and `destid` columns). |
| `result_schema` | str | A writable schema to create the result tables. |
| `result_vertices_table` | str | Name of the result vertices table. The name must not conflict with the names of input tables. |
| `result_edges_table` | str | Name of the edges table to create. The name must not conflict with the names of input tables. |
| `vertex_filter` | str | SQL predicate to filter the vertices (without the `WHERE` keyword). Example: `status = 'ACTIVE' AND score > 0` |
| `result_vertices_indexes` | List[str] | Optional. Columns to index in the result vertices table (e.g., `id` ). Specify an empty list for none. |
| `result_edges_indexes` | List[str] | Optional. Columns to index in the result edges table (e.g., `srcid` and `destid` columns). Specify an empty list for none. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

**Example** Filter US customers and retain edges with endpoints that remain in the filtered vertex set.

Python

```
filter_vertices(
    connection,
    "sales", "customers", "purchases",
    "sales", "customers_us", "purchases_us",
    "country = 'US'",
    ["id"],
    ["srcid","destid"],
)
```

## filter_edges

Creates a filtered edges table by selecting edges that match a predicate.

### Syntax

Python

```
filter_edges(
    connection,
    input_schema,
    input_edges_table,
    result_schema,
    result_edges_table,
    edge_filter,
    [ result_edges_indexes [, ... ] ]
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty achema containing the input edges table. |
| `input_edges_table` | str | Input edges table (must have `srcid` and `destid` columns). |
| `result_schema` | str | A writable schema to create the result tables. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Argument | Data Type | Description |
|---|---|---|
| `result_edges_table` | str | Result edges table name. The name must not conflict with the names of input tables. |
| `edge_filter` | str | SQL predicate on edges (without the `WHERE` keyword). Example: `weight > 0.5 AND type = 'ACTIVE'` |
| `result_edges_indexes` | List[str] | Optional. Columns to index in the result edges table (e.g., `srcid` and `destid` columns). Specify an empty list for none. |

**Example** This example demonstrates how to create a filtered edges table from an existing `purchases` edge set by keeping only edges that meet a business rule ( `weight > 0.5` and `ACTIVE` ). Then, the `filterEdges` method indexes the result on the `srcid` and `destid` columns for faster lookups.

Python

```
filter_edges(
    connection,
    "sales", "purchases",
    "sales", "purchases_filtered",
    "weight > 0.5 AND type = 'ACTIVE'",
    ["srcid", "destid"],
)
```

## mask

Creates a masked subgraph by intersecting two graphs. Vertices intersect if the vertex identifier is present in both graphs. Edges intersect when the `srcid` and `destid` values are present in both graphs.

The function creates a masked subgraph from rows that intersect with each other. The function copies rows that intersect from the graph defined by the arguments `input_vertices_table` and `input_edges_table`, including any attributes.

You can optionally create indexes on the result subgraph tables.

### Syntax

Java

```
mask(
    connection,
    input_schema,
    input_vertices_table,
    input_edges_table,
    other_schema,
    other_vertices_table,
    other_edges_table,
    result_schema,
    result_vertices_table,
    result_edges_table,
    [ result_vertices_indexes [ , ... ] ],
    [ result_edges_indexes [ , ... ] ]
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input tables. |
| `input_vertices_table` | str | The primary vertices table to intersect (must have an `id` column).<br><br>The masked subgraph created by this function copies rows that intersect from this table. |
| `input_edges_table` | str | The primary edges table to intersect (must have `srcid` and `destid` columns).<br><br>The masked subgraph created by this function copies rows that intersect from this table. |
| `other_schema` | str | Schema containing the second graph. |
| `other_vertices_table` | str | The second vertices table to intersect. |
| `other_edges_table` | str | The second edges table to intersect. |
| `result_schema` | str | A writable schema to create the result tables. |
| `result_vertices_table` | str | Name of the vertices table to create. |

© 2026 Ocient, Inc

| Argument | Data Type | Description |
| --- | --- | --- |
| `result_edges_table` | str | Name of the edges table to create. |
| `result_vertices_indexes` | List[str] | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |
| `result_edges_indexes` | List[str] | Optional. Columns to index in the result edges table (e.g., `srcid` and `destid` columns). Specify an empty list for none. |

### Example

Create a masked subgraph by intersecting two graphs. The example copies vertices and edges that are present in both graphs, along with the remaining endpoints.

Java

```
mask(
    connection,
    "sales", "customers", "purchases",
    "ref",   "customers_ref", "purchases_ref",
    "sales", "customers_masked", "purchases_masked",
    ["id"],
    ["srcid", "destid"],
)
```

# Transformations

Construct new vertex or edge tables by computing derived columns, reversing direction, or aggregating duplicates. These functions do not change the original inputs. Instead, the functions materialize new results.

## map_vertices

Creates a new vertices table with the identifier `id` and computed columns. Use the `result_column_expressions` argument to calculate additional columns. This function can also add indexes before inserting data.

### Syntax

Python

```
map_vertices(
    connection,
    input_schema,
    input_vertices_table,
    result_schema,
    result_vertices_table,
    result_column_expressions,
    [ result_vertices_indexes [, ... ] ]
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input vertices table. |
| `input_vertices_table` | str | Input vertices table (must have an `id` column). |
| `result_schema` | str | A schema to create the result vertices table. |
| `result_vertices_table` | str | Name of the result vertices table. The name must not conflict with the names of input tables. |
| `result_column_expressions` | List[str] | One or more SQL expressions defining result columns beyond `id`. Use the `AS alias_name` keyword for stable names. |
| `result_vertices_indexes` | List[str] | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |

**Example** Create a new vertices table with two new columns, `name_upper` and `is_vip`, and generate indexes for the `id` and `name_upper` columns.

Python

```
map_vertices(
    connection,
    "sales", "customers",
    "sales", "customers_enriched",
    [
      "UPPER(name) AS name_upper",
      "CASE WHEN score > 1000 THEN true ELSE false END AS is_vip",
    ],
    ["id","name_upper"],
)
```

## map_edges

Creates a new edges table with `srcid`, `destid`, and any additional computed columns. Expressions should refer to input edge columns by their original names, and each computed expression should include an `AS alias` keyword.

### Syntax

Python

```
map_edges(
    connection,
    input_schema,
    input_edges_table,
    result_schema,
    result_edges_table,
    [ result_column_expressions [, ... ] ],
    [ result_edges_indexes [, ... ] ]
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input edges table. |
| `input_edges_table` | str | Input edges table (must have `srcid` and `destid` columns). |

| Argument | Data Type | Description |
|---|---|---|
| `result_schema` | str | A schema to create the result edges table. |
| `result_edges_table` | str | Name of the result edges table. The name must not conflict with the names of input tables. |
| `result_column_expressions` | List[str] | Optional. SQL expressions for additional edge columns (besides the `srcid` and `destid` columns). Use the `AS alias_name` keyword for stable names. |
| `result_edges_indexes` | List[str] | Optional. Columns to index in the result edges table (e.g., `srcid` and `destid` columns). Specify an empty list for none. |

### Example

Create a new edges table with two columns, `discounted_amount` and `big_txn`, and generate indexes for the `srcid` and `destid` columns.

Python

```
map_edges(
    connection,
    "sales", "purchases",
    "sales", "purchases_enriched",
    [
      "amount * 0.9 AS discounted_amount",
      "CASE WHEN amount > 100 THEN 1 ELSE 0 END AS big_txn",
    ],
    ["srcid","destid"],
)
```

## map_triplets

Creates a new edges table with computed columns that reference `a` (source vertex), `b` (edge), and `c` (destination vertex). The output automatically includes `b.srcid` and `b.destid` columns.

### Syntax

Python

```
map_triplets(
    connection,
    input_schema,
    input_vertices_table,
    input_edges_table,
    result_schema,
    result_edges_table,
    [ result_column_expressions [, ... ] ],
    [ result_edges_indexes [, ... ] ]
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input tables. |
| `input_vertices_table` | str | Input vertices table (must have an `id` column). Used as the `a` and `c` vertices. |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns). This function uses this argument as the `b` edge. |
| `result_schema` | str | A writable schema to create the result edges table. |
| `result_edges_table` | str | Name of the result edges table. The name must not conflict with the names of input tables. |
| `result_column_expressions` | List[str] | Optional. SQL expressions that can reference `a` (source vertex), `b` (edge), and `c` (destination vertex). Use the `AS alias_name` keyword for stable names. |
| `result_edges_indexes` | List[str] | Optional. Columns to index in the result edges table (e.g., `srcid` and `destid` columns). Specify an empty list for none. |

**Example** Create a new triplet table from the vertices and edges tables with the `amount` and `same_country` columns, and generate indexes for the `src` and `destid` columns.

Python

```
map_triplets(
    connection,
    "sales", "customers", "purchases",
    "sales", "purchases_triplets",
    [
      "b.amount AS amount",
      "CASE WHEN a.country = c.country THEN 1 ELSE 0 END AS same_country",
    ],
    ["srcid","destid"],
)
```

## reverse_edges

Creates a new edges table with the `srcid` and `destid` columns reversed, preserving other columns. Use this function to traverse a graph in the opposite direction.

### Syntax

Python

```
reverse_edges(
    connection,
    input_schema,
    input_edges_table,
    result_schema,
    result_edges_table
    [ result_edges_indexes [, ... ] ]
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input edges table. |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns). |
| `result_schema` | str | A writable schema to create the reversed edges table. |

| Argument | Data Type | Description |
| --- | --- | --- |
| `result_edges_table` | str | Name of the reversed edges table to create. The name must not conflict with the names of input tables. |
| `result_edges_indexes` | List[str] | Optional. Columns to index in the result edges table (e.g., `srcid` and `destid` columns). Specify an empty list for none. |

**Example** Transform edge direction by reversing the `srcid` and `destid` columns. The example also creates indexes for these columns.

Python

```
reverse_edges(
    connection,
    "sales", "purchases",
    "sales", "purchases_reversed",
    ["srcid","destid"],
)
```

## group_edges

Groups duplicate rows of the `srcid` and `destid` columns, producing one row for each unique pair of values in a new edges table. This function performs aggregations based on one or more SQL expressions.

### Syntax

Python

```
group_edges(
    connection,
    input_schema,
    input_edges_table,
    result_schema,
    result_edges_table,
    [ result_column_expressions [, ... ] ],
    [ result_edges_indexes [, ... ] ]
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input edges table. |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns). |
| `result_schema` | str | A writable schema to create the grouped tables. |
| `result_edges_table` | str | Name of the grouped edges table. The name must not conflict with the names of input tables. |
| `result_column_expressions` | List[str] | One or more aggregate expressions for the `srcid` and `destid` columns. For details about SQL aggregations, see **Aggregate Functions**.<br><br>Use the `AS alias_name` keyword for stable names. |
| `result_edges_indexes` | List[str] | Optional. Columns to index in the result edges table (e.g., `srcid` and `destid` columns). Specify an empty list for none. |

**Example** Create a new edge table that includes SQL aggregations for counting unique transactions `txn_count` and total sums `total_amount`. Also, this function generates indexes for the `src` and `destid` columns.

Python

```
group_edges(
    connection,
    "sales", "purchases",
    "sales", "purchases_grouped",
    [
      "COUNT(*) AS txn_count",
      "SUM(amount) AS total_amount",
    ],
    ["srcid","destid"],
)
```

# Triplets

Produce triplet representations that are made of `a` (source vertex), `b` (edge), and `c` (destination vertex), either as a logical view or a materialized table for downstream queries.

## create_triplets_view

Creates a view that combines the edge table with the source and destination vertex attributes. This view is useful for analyzing relationships without having to repeatedly join tables. The view includes these columns:

- All original edge columns (including the `srcid` and `destid` columns).
- All source-vertex columns except `id`. Source-vertex column names have the `src_` prefix.
- All destination-vertex columns except `id`. Destination-vertex column names have the `dest_` prefix.

Use the **create_triplets_table** function instead if you want to create a materialized table with indexes instead of a view.

### Syntax

Python

```
create_triplets_view(
    connection,
    input_schema,
    input_vertices_table,
    input_edges_table,
    result_schema,
    result_triplets_view
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input vertices and edges tables. |

| Argument | Data Type | Description |
| --- | --- | --- |
| `input_vertices_table` | str | Input vertices table (must have an `id` column). |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns). |
| `result_schema` | str | A schema to create the view. |
| `result_triplets_view` | str | Name of the triplets view to create. The name must not conflict with the names of input tables. |

**Example** Create a triplets view to inspect edges with joined source and destination vertex attributes.

Python

```
create_triplets_view(
    connection,
    "sales", "customers", "purchases",
    "sales", "triplets_v",
)
```

## create_triplets_table

Creates a materialized table that combines the edge table with the source and destination vertex attributes. This table is useful for analyzing relationships without having to repeatedly join tables. The created table includes these columns:

- All original edge columns (including the `srcid` and `destid` columns).
- All source-vertex columns except `id`. Source-vertex column names have the `src_` prefix.
- All destination-vertex columns except `id`. Destination-vertex column names have the `dest_` prefix.

Use the **create_triplets_view** function if you want to create a view instead of a new table.

### Syntax

Python

```
create_triplets_table(
    connection,
    input_schema,
    input_vertices_table,
    input_edges_table,
    result_schema,
    result_triplets_table,
    [ result_triplets_indexes [, ... ] ]
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input tables. |
| `input_vertices_table` | str | Input vertices table (must have an `id` column). |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns). |
| `result_schema` | str | A schema to create the triplets table. |
| `result_triplets_table` | str | Name of the triplets table to create. The name must not conflict with any input names. |
| `result_triplets_indexes` | List[str] | Optional. Columns to index in the result table. Specify an empty list for none. |

**Example** Create a new table for triplets. Generate indexes for the `src_id` and `dest_id` columns.

Python

```
create_triplets_table(
    connection,
    "sales", "customers", "purchases",
    "sales", "triplets_t",
    ["srcid","destid"],
)
```

# Degrees

Compute degree metrics for each vertex from the edges table. These functions produce small vertex tables suitable for joins and analytics.

## in_degrees

Computes how many edges point to each vertex in an edge table by counting how many times each unique `destid` value appears. The result table has two columns: `id` (the destination vertex) and `in_degree` (the count).

### Syntax

Python

```
in_degrees(
    connection,
    input_schema,
    input_edges_table,
    result_schema,
    result_vertices_table,
    [ result_vertices_indexes [, ... ] ]
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input table. |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns). |
| `result_schema` | str | A schema to create the in-degree table. |
| `result_vertices_table` | str | Name of the vertices table to create (columns include `id` and `in_degree`). |
| `result_vertices_indexes` | List[str] | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |

**Example** Compute in-degrees per vertex and generate an index on the `id` column.

Python

```
in_degrees(
    connection,
    "sales", "purchases",
    "sales", "customers_in_degree",
    ["id"],
)
```

## out_degrees

Computes how many edges originate from each vertex in an edge table by counting how many times each unique `srcid` value appears. The result table has two columns: `id` (the source vertex) and `out_degree` (the count).

### Syntax

Python

```
out_degrees(
    connection,
    input_schema,
    input_edges_table,
    result_schema,
    result_vertices_table,
    [ result_vertices_indexes [, ... ] ]
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input table. |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns). |
| `result_schema` | str | A schema to create the out-degree table. |
| `result_vertices_table` | str | Name of the vertices table to create (columns include `id` and `out_degree`). |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Argument | Data Type | Description |
| --- | --- | --- |
| `result_vertices_indexes` | List[str] | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |

**Example** Compute the out-degrees count for each vertex and generate an index on the `id` column.

Python

```
out_degrees(
    connection,
    "sales", "purchases",
    "sales", "customers_out_degree",
    ["id"],
)
```

## degrees

Computes the total degrees (in-degrees and out-degrees) for each vertex in an edge table by counting how many times each unique `srcid` and `destid` value appears. The result table has two columns: `id` (the destination or source vertex) and `degree` (the count).

### Syntax

Python

```
degrees(
    connection,
    input_schema,
    input_edges_table,
    result_schema,
    result_vertices_table,
    [ result_vertices_indexes [, ... ] ]
)
```

| Argument | Data Type | Description |
| --- | --- | --- |
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |

| Argument | Data Type | Description |
| --- | --- | --- |
| `input_schema` | str | A non-empty schema containing the input table. |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns). |
| `result_schema` | str | A schema to create the degree table. |
| `result_vertices_table` | str | Name of the vertices table to create (columns include `id` and `out_degree`). |
| `result_vertices_indexes` | List[str] | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |

**Example** Compute total degrees for each vertex and generate an index on the `id` column.

Python

```
degrees(
    connection,
    "sales", "purchases",
    "sales", "customers_degree",
    ["id"],
)
```

# Vertex Extraction and Joins

Build vertex sets from edges and combine vertex attributes across tables. These functions are useful for shaping vertex properties and consolidating features.

## from_edges

Builds a vertices table from an edges table by extracting the unique source and destination identifiers.

This function can optionally compute additional columns using SQL expressions by referencing the unique identifier as `ids.id`.

The created table always contains the `id` column with one additional column per expression.

## Syntax

Python

```
from_edges(
    connection,
    input_schema,
    input_edges_table,
    result_schema,
    result_vertices_table,
    [ result_column_expressions [ , ... ] ],
    [ result_vertices_indexes [ , ... ] ]
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input table. |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns). |
| `result_schema` | str | A schema to create the result vertices table. |
| `result_vertices_table` | str | Name of the result vertices table (always includes `id`). |
| `result_column_expressions` | List[str] | Optional. Specify a list of SQL expressions that reference `ids.id` to add additional columns. |
| `result_vertices_indexes` | List[str] | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |

**Example** Create a vertices table from edge endpoints and add a `bucket` column that assigns each vertex to one of 10 buckets. Generate an index for the `id` and `bucket` columns.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

Python

```
from_edges(
    connection,
    "sales", "purchases",
    "sales", "customers_from_edges",
    ["ids.id % 10 AS bucket"],
    ["id","bucket"],
)
```

## join_vertices

Merges two vertices tables by retaining every row from a primary table ( `input_vertices_table` ) and selectively updating rows that also appear in the modification table ( `modification_vertices_table` ). The merged table includes all vertices from the primary table that do not appear in the modification table.

For vertices that appear in both tables, the function must include a list of expressions ( `resultAttributeExpressions` ) in the same column order for every non-identifier column in the merged result table. These SQL expressions can add computations to columns, or simply add aliases if no changes are needed. Each expression can reference columns from the primary table (using alias `a` ) or from the modification table (using alias `b` ).

### Syntax

Python

```
join_vertices(
    connection,
    input_schema,
    input_vertices_table,
    modification_schema,
    modification_vertices_table,
    result_schema,
    result_vertices_table,
    result_attribute_expressions [ , ... ],
    [ result_vertices_indexes [ , ... ] ]
)
```

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Argument | Data Type | Description |
| --- | --- | --- |
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the primary input table. |
| `input_vertices_table` | str | Input vertices table (with the alias `a`). This table must have an `id` column. |
| `modification_schema` | str | A schema for the modification vertices table. |
| `modification_vertices_table` | str | Modification vertices table (with the alias `b`). This table must have an `id` column. |
| `result_schema` | str | A writable schema to create the result tables. |
| `result_vertices_table` | str | Name of the vertices table to create. |
| `result_attribute_expressions` | List[str] | A list of SQL expressions that define the non-identifier columns of the joined result.<br><br>Each expression can reference the left (`input_vertices_table`) vertex as `a` and the right (`modification_vertices_table`) vertex as `b`.<br><br>You must end every expression with an explicit alias using `AS alias_name` so the output column names are stable. |
| `result_vertices_indexes` | List[str] | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |

**Example** Merge vertex attributes and generate indexes for the `id` and `status` columns. This example includes two SQL expressions to update the `status` and `score` columns based on the modification vertex table using the `COALESCE` SQL reference function.

Python

```
join_vertices(
    connection,
    "sales", "customers",
    "sales", "customers_updates",
    "sales", "customers_merged",
    [
      "COALESCE(b.new_status, a.status) AS status",
      "COALESCE(b.score_delta + a.score, a.score) AS score",
    ],
    ["id","status"],
)
```

## inner_join_vertices

Performs an inner join on two vertex tables using an equality comparison `a.id = b.id`. The result table automatically includes the `id` column from the first table.

The function must include a list of SQL expressions ( `result_attribute_expressions` ) in the same column order for every non-identifier column in the merged result table. These SQL expressions can add computations to columns, or simply add aliases if no changes are needed. Each expression can reference columns from the primary table using the alias `a` or from the modification table using the alias `b`.

### Syntax

Python

```
inner_join_vertices(
    connection,
    input_schema,
    input_vertices_table,
    other_schema,
    other_vertices_table,
    result_schema,
    result_vertices_table,
    result_attribute_expressions [ , ... ],
    [ result_vertices_indexes [ , ... ] ]
)
```

| Argument | Data Type | Description |
| --- | --- | --- |
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A schema for the left vertices table. |
| `input_vertices_table` | str | Input vertices table for the left side of the join (must have an `id` column). |
| `other_schema` | str | A schema for the right vertices table. |
| `other_vertices_table` | str | The other vertices table for the right side of the join (must have an `id` column). |
| `result_schema` | str | A writable schema to create the result tables. |
| `result_vertices_table` | str | Name of the vertices table to create. |
| `result_attribute_expressions` | List[str] | A list of SQL expressions that define the non-identifier columns of the joined result.<br><br>Each expression can reference the left ( `input_vertices_table` ) vertex as `a` and the right ( `other_vertices_table` ) vertex as `b` .<br><br>You must end every expression with an explicit alias using `AS alias_name` to ensure the output column names are stable. |
| `result_vertices_indexes` | List[str] | Optional. Columns to index in the result vertices table (e.g., `id` ). Specify an empty list for none. |

**Example** Create an inner join between two vertex tables and generate an index on the `id` column.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

Python

```
inner_join_vertices(
    connection,
    "sales", "customers",
    "sales", "profiles",
    "sales", "customers_joined",
    [
      "a.id AS id",
      "a.status AS status",
      "b.tier AS tier",
    ],
    ["id"],
)
```

## outer_join_vertices

Performs a left outer join between two vertices tables using an equality comparison `a.id = b.id`. The result table includes all rows from the left table. For left-table rows that have no match in the right table, any expression that reads columns from the right table with the alias `b` evaluates to NULL (while expressions that only read the table with the alias `a` remain non-NULL as usual).

The method must include a list of SQL expressions ( `result_attribute_expressions` ) in the same column order for every non-identifier column in the merged result table. These SQL expressions can add computations to columns, or simply add aliases if no changes are needed. Each expression can reference columns from the primary table using the alias `a` or from the modification table using the alias `b`.

### Syntax

Python

```
outer_join_vertices(
    connection,
    input_schema,
    input_vertices_table,
    other_schema,
    other_vertices_table,
    result_schema,
    result_vertices_table,
    result_attribute_expressions [ , ... ],
    [ result_vertices_indexes [ , ... ] ]
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A schema for the left vertices table. |
| `input_vertices_table` | str | Left vertices table (must have an `id` column). |
| `other_schema` | str | A schema for the right vertices table (with the alias `b`). |
| `other_vertices_table` | str | Right vertices table (must have an `id` column). |
| `result_schema` | str | A writable schema to create the result tables. |
| `result_vertices_table` | str | Name of the vertices table to create. |
| `result_attribute_expressions` | List[str] | A list of SQL expressions that define the non-identifier columns of the joined result.<br><br>Each expression can reference the left (`input_vertices_table`) vertex as `a` and the right (`other_vertices_table`) vertex as `b`.<br><br>You must end every expression with an explicit alias using `AS alias_name` to ensure the output column names are stable. |
| `result_vertices_indexes` | List[str] | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |

**Example** Perform a left outer join on two vertices tables and generate an index on the `id` column.

Python

```
outer_join_vertices(
    connection,
    "sales", "customers",
    "sales", "profiles",
    "sales", "customers_joined",
    [
      "a.id AS id",
      "a.status AS status",
      "b.tier AS tier",
    ],
    ["id"],
)
```

## collect_neighbors

For each vertex in a table, this function collects information on neighbors (identifier and any attributes) as an array of tuples. For a specified direction ( `IN` , `OUT` , or `BOTH` ), the function aggregates tuples representing each neighboring vertex into an array.

The direction types are:

- `IN` — Neighbors with edges pointing to the vertex (edges where `destid = id` ).
- `OUT` — Neighbors that the vertex points to (edges where `srcid = id` ).
- `BOTH` — Union of `IN` and `OUT` with neighbors from incoming ( `destid = id` ) and outgoing ( `srcid = id` ) edges.

The result table has the columns `id` (the vertex identifier) and `neighbors` (an array of tuples representing each neighbor).

If an error occurs after table creation, the function drops the result table.

### Syntax

Python

```
collect_neighbors(
    connection,
    input_schema,
    input_vertices_table,
    input_edges_table,
    result_schema,
    result_table,
    direction,
    [ result_indexes [ , ... ] ]
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input tables. |
| `input_vertices_table` | str | Input vertices table (must have an `id` column). |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns). |
| `result_schema` | str | A writable schema to create the result tables. |
| `result_table` | str | Name of the neighbors collection table (with the `id` and `neighbors` columns). |
| `direction` | EdgeDirection | Specifies the direction of traversal. Supported values are:<br>`IN` — Neighbors that have edges pointing to the vertex (edges where `destid = id`).<br>For example, if an edge `5` points to `10`, then for `id=10`, neighbor `5` is included.<br><br>`OUT` — Neighbors that the vertex points to (edges where `srcid = id`).<br>For example: If an edge `5` points to `10`, then for `id=5`, neighbor `10` is included.<br><br>`BOTH` — The union of `IN` and `OUT`. This traversal includes neighbors from edges pointing to `id` and edges from `id`. |
| `result_indexes` | List[str] | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |

**Example** Collect incoming neighbors for each vertex and generate an index on the `id` column. The `direction` argument set to `IN` collects neighbors pointing to `id`.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

Python

```
collect_neighbors(
    connection,
    "sales", "customers", "purchases",
    "sales", "neighbors_in",
    EdgeDirection.IN,
    ["id"],
)
```

## collect_edges

For each vertex in a table, this function collects an array of adjacent edge rows based on the specified direction. The result table has two columns: `id` (the vertex identifier) and `edges` (an array of tuples, each tuple containing all columns from the edges table for a connected edge).

The `direction` types are:

- `IN` — Edges pointing to the vertex (edges where `destid = id`).
- `OUT` — Edges originating from the vertex (edges where `srcid = id`).
- `BOTH` — Union of `IN` and `OUT` that includes edges from incoming (`destid = id`) and outgoing (`srcid = id`) directions. This direction retains duplicates.

If an error occurs after table creation, the function drops the result table.

### Syntax

Python

```
collect_edges(
    connection,
    input_schema,
    input_vertices_table,
    input_edges_table,
    result_schema,
    result_table,
    direction,
    [ result_indexes [ , ... ] ]
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input tables. |
| `input_vertices_table` | str | Input vertices table (must have an `id` column). |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns). |
| `result_schema` | str | A writable schema to create the result tables. |
| `result_table` | str | Name of the edge collection table (with the `id` and `edges` columns). |
| `direction` | EdgeDirection | Specifies the direction of traversal. Supported values are:<br>`IN` — Neighbors that have edges pointing to the vertex (edges where `destid = id`).<br>For example, if an edge `5` points to `10`, then for `id=10`, neighbor `5` is included.<br><br>`OUT` — Neighbors that the vertex points to (edges where `srcid = id`). For example, if an edge `5` points to `10`, then for `id=5`, neighbor `10` is included.<br><br>`BOTH` — The union of `IN` and `OUT`. This traversal includes neighbors from edges pointing to `id` and edges from `id`. |
| `result_indexes` | List[str] | Optional. Columns to index. Specify an empty list for none. |

**Example** Collect outgoing edges per vertex. The example sets the `direction` to `OUT` to collect edges from `id`.

Python

```
collect_edges(
    connection,
    "sales", "customers", "purchases",
    "sales", "outgoing_edges",
    EdgeDirection.OUT,
    ["id"],
)
```

# Algorithms

High-level graph algorithms that iterate over the graph structure to produce labels, components, or counts.

## label_propagation

Executes the **Label Propagation Algorithm** (LPA) to assign community labels to vertices.

Each vertex starts with its own identifier as its label. For a number set by the `maxIterations` argument, each vertex updates its label to the most frequent label among its neighbors. The algorithm determines ties by choosing the smallest label. The algorithm uses temporary tables for intermediate results and drops these tables when the process completes or if it fails. Isolated vertices retain their initial label. The final table stores `id` and `label` columns and can include indexes.

### Syntax

Python

```
label_propagation(
    connection,
    input_schema,
    input_vertices_table,
    input_edges_table,
    result_schema,
    result_vertices_table,
    max_iterations,
    result_vertices_indexes,
    [ result_vertices_indexes [ , ... ] ]
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input tables. |
| `input_vertices_table` | str | Input vertices table (must have an `id` column). |

| Argument | Data Type | Description |
| --- | --- | --- |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns). |
| `result_schema` | str | A writable schema to create the result tables. |
| `result_vertices_table` | str | Name of the vertices table to create (columns include `id` and `label`). |
| `max_iterations` | int | Maximum number of iterations (must be `1` or greater). |
| `result_vertices_indexes` | List[str] | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |

**Example** Run label propagation for 10 iterations and assign labels to vertices. Generate an index on the `id` column.

Python

```
label_propagation(
    connection,
    "sales", "customers", "purchases",
    "sales", "lpa_labels",
    10,
    ["id"],
)
```

## connected_components

Identifies the connected components of an undirected graph. This algorithm configures a Pregel computation in which each vertex initially sets its component label equal to its own identifier `id`.

In each iteration, vertices send their component label to neighbors. Each vertex updates based on the aggregated minimum value of its current component label and any received values. The process repeats until no more updates occur.

The result table maps each vertex `id` to its final `component` label.

### Syntax

Python

```
connected_components(
    connection,
    input_schema,
    input_vertices_table,
    input_edges_table,
    result_schema,
    result_vertices_table,
    [ result_vertices_indexes [ , ... ] ]
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input tables. |
| `input_vertices_table` | str | Input vertices table (must have an `id` column). |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns). |
| `result_schema` | str | A writable schema to create the result tables. |
| `result_vertices_table` | str | Name of the vertices table to create. |
| `result_vertices_indexes` | List[str] | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |

## Example

Compute connected components and generate an index on the `id` column.

Python

```
connected_components(
    connection,
    "sales", "customers", "purchases",
    "sales", "components",
    ["id"],
)
```

© 2026 Ocient, Inc

## strongly_connected_components

Computes strongly connected components (SCC) in a directed graph. This function runs a recursive algorithm that partitions vertices into subsets where every vertex is reachable from other vertices in the same subset.

This function uses recursive partitioning. The algorithm selects a pivot (typically the minimum identifier `id`), computes its predecessor set (vertices that can reach the pivot), and its descendant sets (vertices reachable from the pivot). Then, the function identifies the SCC as their intersection, removes that SCC from the graph, and recurses on the remainder until all vertices have been assigned to an SCC. The output contains columns for the `id` and `component` identifiers (the minimum `id` in the SCC).

The function creates temporary tables in the result schema to store intermediate results. This function drops these tables when the computation completes or fails. The final result table contains two columns: `id` (vertex identifier) and `component` (the minimum vertex identifier in its SCC subset).

### Syntax

Python

```
strongly_connected_components(
    connection,
    input_schema,
    input_vertices_table,
    input_edges_table,
    result_schema,
    result_vertices_table,
    [ result_vertices_indexes [ , ... ] ]
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input tables. |
| `input_vertices_table` | str | Input vertices table (must have an `id` column). |

| Argument | Data Type | Description |
| --- | --- | --- |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns). |
| `result_schema` | str | A writable schema to create the result tables. |
| `result_vertices_table` | str | Name of the vertices table to create (columns include `id` and `component`). |
| `result_vertices_indexes` | List[str] | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |

**Example** Compute the SCC and generate an index on the `id` column.

Python

```
strongly_connected_components(
    connection,
    "sales", "customers", "purchases",
    "sales", "scc",
    ["id"],
)
```

## TriangleCount

TriangleCount identifies all 3-cycles (triangles) in the graph and counts how many distinct triangles each vertex participates in.

The algorithm first builds a canonical, undirected edge set by ensuring `srcid < destid` and removing duplicates to prevent double-counting. If your input edges are already canonicalized and deduplicated, use `TriangleCount.run_pre_canonicalized` to skip preprocessing for faster performance.

The function then counts triangles ( `a` , `b` , `c` ) where `a < b < c` by intersecting neighbor lists and aggregates per-vertex participation to produce a result table with the `id` and `triangle_count` columns.

### `run` syntax

Python

```
TriangleCount.run(
    input_schema,
    input_vertices_table,
    input_edges_table,
    result_schema,
    result_vertices_table,
    [ result_vertices_indexes [ , ... ] ],
)
```

### `run_pre_canonicalized` syntax

Python

```
TriangleCount.run_pre_canonicalized(
    connection,
    input_schema,
    input_vertices_table,
    canonical_edges_schema,
    canonical_edges_table,
    result_schema,
    result_vertices_table,
    [ result_vertices_indexes [ , ... ] ]
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input tables. |
| `input_vertices_table` | str | Input vertices table (must have an `id` column). |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns).<br><br>For `runPreCanonicalized` execution, the function assumes this table is already canonicalized (e.g., `srcid < destid`) and deduplicated. |
| `result_schema` | str | A writable schema to create the result tables. |

| Argument | Data Type | Description |
| --- | --- | --- |
| `result_vertices_table` | str | Name of the vertices table to create (columns include `id` and `triangle_count`). |
| `result_vertices_indexes` | list[str] | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |

## Examples

### Count Triangles Using `run`

Canonicalize the raw edges internally, count unique triangles, and write per-vertex triangle counts with an index on the `id` column.

Python

```
TriangleCount.run(
    connection,
    "sales",
    "customers",
    "purchases",
    "sales",
    "triangle_counts",
    ["id"],
)
```

### Count Triangles Using `run_pre_canonicalized`

Use a pre-canonicalized, deduplicated edge table to count triangles and write per-vertex triangle counts with an index on the `id` column.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

Python

```
TriangleCount.run_pre_canonicalized(
    connection,
    "sales",
    "customers",
    "sales",
    "purchases_canonical",
    "sales",
    "triangle_counts",
    ["id"],
)
```

## pregel

Provides a generic vertex-centered iteration framework for custom graph algorithms, similar to the **Pregel model**.

Each iteration updates vertex states by sending messages along edges and then aggregating these messages to compute new states. The algorithm continues iterating until it reaches convergence (no state changes or no messages produced) or a specified iteration cap.

The algorithm uses multiple specified SQL expressions.

### Syntax

Python

```
pregel(
    connection,
    input_schema,
    input_vertices_table,
    input_edges_table,
    result_schema,
    result_vertices_table,
    initializer_expr,
    send_to_source_expr,
    send_to_dest_expr,
    aggregate_expr,
    updater_expr,
    max_iterations,
    [ result_vertices_indexes [ , ... ] ]
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input tables. |
| `input_vertices_table` | str | Input vertices table (must have an `id` column). |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns). |
| `result_schema` | str | A writable schema to create the result tables. |
| `result_vertices_table` | str | Name of the vertices table to create (columns include `id` and `result`). |
| `initializer_expr` | str | A SQL expression to compute the initial state for each vertex (e.g., `CASE WHEN type = 'seed' THEN 1.0 ELSE 0.0 END`). |
| `send_to_source_expr` | str | Optional. Defines the message sent to the source vertex of an edge, referencing the current vertex states `a.state` (source) and `c.state` (destination), and any edge attributes in `b`.<br>Example: `CASE WHEN a.country = c.country THEN 1 ELSE 0 END` |

| Argument | Data Type | Description |
|---|---|---|
| `send_to_dest_expr` | str | Optional. Defines the message sent to the destination vertex of an edge, referencing the current vertex states `a.state` (source) and `c.state` (destination), and any edge attributes as `b.<edge_column>`.<br>Example: `CASE WHEN a.country = c.country THEN 1 ELSE 0 END` |
| `aggregate_expr` | str | A SQL aggregation to combine messages per vertex (e.g., `SUM(msg)`).<br>For a list of supported aggregations, see **Aggregate Functions**. |
| `updater_expr` | str | A SQL expression to compute the next state from the current state and aggregated messages.<br><br>For example, this code updates the state to the minimum current state and the aggregated message (similar to the **connected_components** function): `LEAST(a.state, COALESCE(m.aggregated_message, a.state)) AS state` |
| `max_iterations` | int | Maximum number of iterations (must be either `-1` or a value of `1` or greater).<br><br>If this value is `-1`, the Pregel algorithm has no limit, and it runs until convergence.<br><br>A value of `0` causes the algorithm to return an error. |
| `result_vertices_indexes` | List[str] | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |

**Example** Run a simple Pregel computation summing incoming edge amounts into the vertex state for 10 iterations at most, and generate an index on the `id` column.

Python

```
pregel(
    connection,
    "sales", "customers", "purchases",
    "sales", "pregel_result",
    "0 AS state",
    "b.amount",
    None,
    "SUM(msg) AS aggregated_message",
    "state + COALESCE(aggregated_message, 0) AS state",
    10,
    ["id"],
)
```

# Paths & Ranking

These functions include the shortest-path and PageRank algorithms.

## shortest_paths

Computes the shortest distance from every vertex to each set of landmark vertices using an iterative relaxation algorithm. The algorithm resembles **Bellman–Ford** but simultaneously handles multiple destinations.

Each landmark starts at distance `0` and all others at positive infinity. On each iteration, the algorithm examines every edge and checks whether traveling through the connected neighbor would yield a shorter route to a landmark. If a shorter route exists, the algorithm updates the distance of the source vertex. The process stops when no distances improve or the algorithm reaches the maximum number of iterations.

After the process finishes, the algorithm writes a result table with the `srcid`, `destid`, and `distance` columns.

### Syntax

Python

```
shortest_paths(
    connection,
    input_schema,
    input_vertices_table,
    input_edges_table,
    result_schema,
    result_table,
    landmarks[ , ... ],
    edge_weight_column,
    max_iterations,
    [ result_vertices_indexes [ , ... ] ]
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input tables. |
| `input_vertices_table` | str | Input vertices table (must have an `id` column). |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns). |
| `result_schema` | str | A writable schema to create the result table. |
| `result_table` | str | Name of the distances result table. This table has the `srcid`, `destid`, and `distance` columns. |
| `landmarks` | List[int] | One or more landmark vertex identifiers. This list must be non-empty and contain no NULLs. |
| `edge_weight_column` | Optional[str] | Optional. The name of an edge weight column.<br>If you do not specify this argument, the default value is `1.0`. |
| `max_iterations` | int | Maximum number of relaxation iterations. This value must be `1` or greater. |
| `result_indexes` | List[str] | Optional. The list of columns to index in the result table (`srcid`, `destid`, and `distance` columns).<br><br>Specify an empty list for none. |

© 2026 Ocient, Inc

**Example** Compute distances from landmarks and generate indexes on the `src` and `dest` columns.

Python

```
shortest_paths(
    connection,
    "sales", "customers", "purchases",
    "sales", "distances",
    [1, 42],
    None,
    10,
    ["srcid","destid"],
)
```

## static_page_rank

Computes **PageRank** scores for each vertex over a fixed number of iterations.

The algorithm follows the standard PageRank formula with a damping factor ( `damping_factor` ) and uses common table expressions to calculate contributions from incoming edges and redistribute ranks from dangling nodes.

The algorithm supports two variants:

- Standard PageRank — All vertices start with rank `1.0/N`, where `N` is the number of vertices. Specify this variant if `personalizationSrcId` is `null`.
- Personalized PageRank — The specified vertex starts with a rank of `1.0`, while others start with a rank of `0.0`. Specify this variant if `personalizationSrcId` is a vertex identifier.

After running PageRank for a fixed number of iterations, the function writes a result vertices table containing all original vertex columns with a new PageRank scoring column.

### Syntax

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

Python

```
static_page_rank(
    connection,
    input_schema,
    input_vertices_table,
    input_edges_table,
    result_schema,
    result_vertices_table,
    num_iterations,
    damping_factor,
    [ result_vertices_indexes [ , ... ] ],
    personalization_src_id,
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input tables. |
| `input_vertices_table` | str | Input vertices table (must have an `id` column). |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns). |
| `result_schema` | str | A writable schema to create the result tables. |
| `result_vertices_table` | str | Name of the vertices table to create (columns include all vertex columns and a `pagerank` column). |
| `num_iterations` | int | Number of iterations to run. This value must be 1 or greater. |
| `damping_factor` | float | The damping factor, a value between `0.0` and `1.0`, that controls how the PageRank random surfer moves across vertices.<br><br>A high value (e.g., `0.85`) puts more emphasis on link structure, encouraging the algorithm to move from each vertex to a neighbor. This value means PageRank scores tend to concentrate around well-linked regions.<br><br>A lower value (e.g., `0.50`) allows the algorithm to ignore edges and instead jump to a vertex chosen from a base distribution. For standard PageRank, this base is uniform over all vertices. For personalized PageRank, the |

| Argument | Data Type | Description |
| --- | --- | --- |
| | | base is biased toward the specified vertex. This behavior creates more uniform scoring with less sensitivity to link topology.<br><br>If this value is outside the range `0.0` to `1.0`, the function raises an error. |
| `result_vertices_indexes` | List[str] | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |
| `personalization_src_id` | Optional[int] | Determines whether PageRank uses the standard or the personalized variant.<br><br>For personalized mode, specify a vertex identifier. PageRank scoring starts with this vertex set at `1.0`, while all other vertices start at `0.0`.<br><br>For standard mode, specify `None`. All vertices start with rank `1.0/N`, where `N` is the number of vertices. |

**Example** Run fixed-iteration PageRank and generate an index on the `id` column. This example uses a damping factor of `0.85` to ensure the ranking concentrates on highly linked regions.

Python

```
static_page_rank(
    connection,
    "sales", "customers", "purchases",
    "sales", "pagerank_static",
    10,
    0.85,
    ["id"],
    None,
)
```

## dynamic_page_rank

Computes PageRank scores until convergence based on a specified threshold value (`tolerance`). Unlike the **static_page_rank** function, this algorithm runs iterations until the sum of absolute differences between ranks in successive iterations is less than or equal to the `tolerance` value. The algorithm handles personalization similarly to

`static_page_rank`. At each iteration, the function uses the PageRank formula, collects rank values, and redistributes them.

The algorithm supports two variants:

- Standard PageRank — All vertices start with rank `1.0/N`, where `N` is the number of vertices. Specify this variant if `personalizationSrcId` is `null`.
- Personalized PageRank — The specified vertex starts with a rank of `1.0`, while others start with a rank of `0.0`. Specify this variant if `personalizationSrcId` is a vertex identifier.

After running PageRank until the system reaches the `tolerance` threshold, the function writes a vertices table containing all the original vertex columns with a new PageRank scoring column.

### Syntax

Python

```
dynamic_page_rank(
    connection,
    input_schema,
    input_vertices_table,
    input_edges_table,
    result_schema,
    result_vertices_table,
    tolerance,
    damping_factor,
    [ result_vertices_indexes [ , ... ] ],
    personalization_src_id,
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input tables. |
| `input_vertices_table` | str | Input vertices table (must have an `id` column). |

| Argument | Data Type | Description |
| --- | --- | --- |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns). |
| `result_schema` | str | A writable schema to create the result tables. |
| `result_vertices_table` | str | Name of the vertices table to create (columns include all vertex columns and `pagerank`). |
| `tolerance` | float | The convergence threshold that stops iterations when the rank changes become negligible.<br><br>After each iteration, the algorithm measures the maximum change in any rank of a vertex. If that change is below the specified tolerance, the algorithm considers the computation converged and stops early.<br><br>A high tolerance value (e.g., `0.001`) is good for quick exploratory runs that generate an approximate ranking.<br><br>A low tolerance value (e.g., `0.000001`) generates a precise ranking, but requires a higher compute cost. |
| `damping_factor` | float | The damping factor, a value between `0.0` and `1.0`, that controls how the PageRank random surfer moves across vertices.<br><br>A high value (e.g., `0.85`) puts more emphasis on link structure, encouraging the algorithm to move from each vertex to a neighbor. The high value means PageRank scores tend to concentrate around well-linked regions.<br><br>A lower value (e.g., `0.50`) allows the algorithm to ignore edges and instead jump to a vertex chosen from a base distribution. For standard PageRank, this base is uniform over all vertices. For personalized PageRank, the base is biased toward the specified vertex. This behavior creates more uniform scoring with less sensitivity to link topology.<br><br>If this value is outside the range `0.0` to `1.0`, the function raises an error. |
| `result_vertices_indexes` | List[str] | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |
| `personalization_src_id` | Optional[int] | Determines whether PageRank uses the standard or the personalized variant.<br><br>For personalized mode, specify a vertex identifier. PageRank scoring starts with this vertex set at `1.0`, while all other vertices start at `0.0`. |

| Argument | Data Type | Description |
| --- | --- | --- |
| | | For standard mode, specify `None`. All vertices start with rank `1.0/N`, where `N` is the number of vertices. |

**Example** Run dynamic PageRank to convergence and generate an index on the `id` column. This example uses a low `tolerance` value of `1.0e-6`, which generates high-precision rankings but requires more computing resources.

Python

```
dynamic_page_rank(
    connection,
    "sales", "customers", "purchases",
    "sales", "pagerank_dynamic",
    1.0e-6,
    0.85,
    ["id"],
    None,
)
```

You can specify the deprecated `reset_prob` keyword argument instead of the `damping_factor` argument. The value means the same thing (the damping factor, and not the teleport probability). Specifying the `reset_prob` argument raises the `DeprecationWarning` warning. You cannot specify both `damping_factor` and `reset_prob` arguments in the same function call, but you must specify one of them.

## stable_marriage

Computes a stable matching between two groups using the **Gale–Shapley algorithm**. Each suitor proposes to candidates in order of preference, and each candidate tentatively holds the best proposal received. The algorithm iterates until no suitor can improve or until it reaches `max_iterations` rounds, producing a suitor-optimal stable matching.

The suitor preferences table must have the `suitor_id`, `candidate_id`, and `rank` columns. The candidate preferences table must have the `candidate_id`, `suitor_id`, and `rank` columns. All `rank` values must be non-NULL. The result table contains the `suitor_id` and `candidate_id` columns.

### Syntax

Python

```
stable_marriage(
    connection,
    input_schema,
    input_suitor_prefs_table,
    input_candidate_prefs_table,
    result_schema,
    result_table,
    max_iterations,
    [ result_indexes [ , ... ] ]
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input tables. |
| `input_suitor_prefs_table` | str | Suitor preferences table (must have `suitor_id`, `candidate_id`, and `rank` columns). |
| `input_candidate_prefs_table` | str | Candidate preferences table (must have `candidate_id`, `suitor_id`, and `rank` columns). |
| `result_schema` | str | A writable schema to create the result tables. |
| `result_table` | str | Name of the result table to create (includes the `suitor_id` and `candidate_id` columns). |
| `max_iterations` | int | Maximum number of proposal rounds that must be `1` or greater. |
| `result_indexes` | List[str] | Optional. Columns to index in the result table (e.g., `suitor_id`). Specify an empty list for none. |

## Example

Compute a stable matching between suitors and candidates with a maximum of 20 rounds.

Python

```
stable_marriage(
    connection,
    "sales", "suitor_prefs", "candidate_prefs",
    "sales", "matches",
    20,
    ["suitor_id"],
)
```

## jaccard_similarity

Computes the **Jaccard similarity** for every pair of vertices that share at least one neighbor. The Jaccard similarity between two vertices is the size of the intersection of their neighbor sets divided by the size of their union. This metric is useful for link prediction and duplicate detection.

The result table contains the `srcid`, `destid`, and `similarity` columns.

### Syntax

Python

```
jaccard_similarity(
    connection,
    input_schema,
    input_edges_table,
    result_schema,
    result_table,
    [ result_indexes [ , ... ] ]
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input tables. |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns). |
| `result_schema` | str | A writable schema to create the result tables. |

| Argument | Data Type | Description |
|---|---|---|
| `result_table` | str | Name of the result table to create (includes the `srcid`, `destid`, and `similarity` columns). |
| `result_indexes` | List[str] | Optional. Columns to index in the result table (e.g., `srcid` and `destid`). Specify an empty list for none. |

### Example

Compute pairwise Jaccard similarity scores.

Python

```
jaccard_similarity(
    connection,
    "sales", "purchases",
    "sales", "jaccard_scores",
    ["srcid", "destid"],
)
```

## cosine_similarity

Computes the **cosine similarity** for every pair of vertices that share at least one neighbor. The cosine similarity represents the cosine of the angle between two neighbor-set vectors. This metric is useful for recommendation systems and measuring structural equivalence.

The result table contains the `srcid`, `destid`, and `similarity` columns.

### Syntax

Python

```
cosine_similarity(
    connection,
    input_schema,
    input_edges_table,
    result_schema,
    result_table,
    [ result_indexes [ , ... ] ]
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input tables. |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns). |
| `result_schema` | str | A writable schema to create the result tables. |
| `result_table` | str | Name of the result table to create (includes the `srcid`, `destid`, and `similarity` columns). |
| `result_indexes` | List[str] | Optional. Columns to index in the result table (e.g., `srcid` and `destid`). Specify an empty list for none. |

### Example

Compute pairwise cosine similarity scores.

Python

```
cosine_similarity(
    connection,
    "sales", "purchases",
    "sales", "cosine_scores",
    ["srcid", "destid"],
)
```

## k_core_decomposition

Computes the **k-core decomposition** of a graph by iteratively removing vertices with degree less than `k` until only the maximal subgraph with the minimum degree `k` remains. The algorithm computes the coreness value for each vertex.

The result table contains the `id` and `core` columns.

### Syntax

Python

```
k_core_decomposition(
    connection,
    input_schema,
    input_vertices_table,
    input_edges_table,
    result_schema,
    result_table,
    [ result_indexes [ , ... ] ]
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input tables. |
| `input_vertices_table` | str | Input vertices table (must have an `id` column). |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns). |
| `result_schema` | str | A writable schema to create the result tables. |
| `result_table` | str | Name of the result table to create (includes the `id` and `core` columns). |
| `result_indexes` | List[str] | Optional. Columns to index in the result table (e.g., `id`). Specify an empty list for none. |

## Example

Compute k-core decomposition and index on the `id` column.

Python

```
k_core_decomposition(
    connection,
    "sales", "customers", "purchases",
    "sales", "kcore_result",
    ["id"],
)
```

## eigenvector_centrality

Computes **eigenvector centrality** scores for each vertex by iteratively updating the score of each vertex to be the sum of the scores of its neighbors, followed by normalization. Vertices connected to other high-scoring vertices receive higher centrality.

The result table contains the `id` and `centrality` columns.

### Syntax

Python

```
eigenvector_centrality(
    connection,
    input_schema,
    input_vertices_table,
    input_edges_table,
    result_schema,
    result_table,
    num_iterations,
    [ result_indexes [ , ... ] ]
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input tables. |
| `input_vertices_table` | str | Input vertices table (must have an `id` column). |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns). |
| `result_schema` | str | A writable schema to create the result tables. |
| `result_table` | str | Name of the result table to create (includes the `id` and `centrality` columns). |
| `num_iterations` | int | Number of power-iteration rounds that must be `1` or greater. |
| `result_indexes` | List[str] | Optional. Columns to index in the result table (e.g., `id`). Specify an empty list for none. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

### Example

Compute eigenvector centrality with 20 iterations.

Python

```
eigenvector_centrality(
    connection,
    "sales", "customers", "purchases",
    "sales", "eigenvec_result",
    20,
    ["id"],
)
```

## cycle_detection

Detects vertices that participate in cycles in a directed graph using iterative degree-based peeling. The algorithm repeatedly removes vertices with an in-degree or out-degree of zero until no such vertices remain. The remaining vertices are those involved in at least one cycle.

The result table includes the `id` column for each vertex in a cycle.

### Syntax

Python

```
cycle_detection(
    connection,
    input_schema,
    input_vertices_table,
    input_edges_table,
    result_schema,
    result_table,
    [ result_indexes [ , ... ] ]
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |

| Argument | Data Type | Description |
|---|---|---|
| `input_schema` | str | A non-empty schema containing the input tables. |
| `input_vertices_table` | str | Input vertices table (must have an `id` column). |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns). |
| `result_schema` | str | A writable schema to create the result tables. |
| `result_table` | str | Name of the result table to create (includes the `id` column). |
| `result_indexes` | List[str] | Optional. Columns to index in the result table (e.g., `id` ). Specify an empty list for none. |

### Example

Detect vertices involved in cycles.

Python

```
cycle_detection(
    connection,
    "sales", "customers", "purchases",
    "sales", "cycle_vertices",
    ["id"],
)
```

## max_bipartite_matching

Computes **maximum matching** in a bipartite graph using an iterative augmenting-path approach. The algorithm greedily matches unmatched vertices and then refines the matching until it finds no further augmenting path or until it reaches the number of rounds as specified by the `max_iterations` value. The result is a set of edges where no two edges share a vertex.

The result table contains the `srcid` and `destid` columns.

### Syntax

Python

```
max_bipartite_matching(
    connection,
    input_schema,
    input_edges_table,
    result_schema,
    result_table,
    max_iterations,
    [ result_indexes [ , ... ] ]
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input tables. |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns). The graph must be bipartite, where the source and destination vertices must form two disjoint sets. |
| `result_schema` | str | A writable schema to create the result tables. |
| `result_table` | str | Name of the result table to create (includes the `srcid` and `destid` columns). |
| `max_iterations` | int | Maximum number of augmentation rounds that must be `1` or greater. |
| `result_indexes` | List[str] | Optional. Columns to index in the result table (e.g., `srcid` and `destid`). Specify an empty list for none. |

## Example

Compute a maximum bipartite matching with up to 10 augmentation rounds.

Python

```
max_bipartite_matching(
    connection,
    "sales", "purchases",
    "sales", "bipartite_matches",
    10,
    ["srcid", "destid"],
)
```

## louvain_modularity_optimization

Detects communities using the **Louvain method**, a greedy modularity optimization algorithm. The algorithm iteratively moves vertices between communities to maximize modularity, then aggregates communities and repeats until modularity stops improving or until it reaches the number of rounds as specified by the `max_iterations` value.

The result table contains the `id` and `community` columns.

### Syntax

Python

```
louvain_modularity_optimization(
    connection,
    input_schema,
    input_vertices_table,
    input_edges_table,
    weight_col,
    result_schema,
    result_table,
    max_iterations,
    [ result_indexes [ , ... ] ]
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input tables. |

| Argument | Data Type | Description |
| --- | --- | --- |
| `input_vertices_table` | str | Input vertices table (must have an `id` column). |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns). |
| `weight_col` | str or None | The name of the edge weight column. Specify `None` for unweighted graphs. The default weight is `1.0`. |
| `result_schema` | str | A writable schema to create the result tables. |
| `result_table` | str | Name of the result table to create (includes the `id` and `community` columns). |
| `max_iterations` | int | Maximum number of iterations that must be `1` or greater. |
| `result_indexes` | List[str] | Optional. Columns to index in the result table (e.g., `id`). Specify an empty list for none. |

### Example

Detect communities using the Louvain method with a maximum of 10 iterations on an unweighted graph.

Python

```
louvain_modularity_optimization(
    connection,
    "sales", "customers", "purchases",
    None,
    "sales", "louvain_communities",
    10,
    ["id"],
)
```

## aggregate_messages

A general-purpose message-passing primitive that sends messages along edges and aggregates them at destination vertices. This function is useful for building custom graph computations, feature engineering, and implementing algorithms not available as built-in functions.

For each edge, the function evaluates a message expression referencing source vertex attributes ( `a.*` ), edge attributes ( `b.*` ), and destination vertex attributes ( `c.*` ). The function then aggregates the messages for each destination vertex using a SQL aggregation function.

The result table contains the vertex `id` and the aggregated message column, named using the `AS` alias in the `aggregate_expr` argument.

### Syntax

Python

```
aggregate_messages(
    connection,
    input_schema,
    input_vertices_table,
    input_edges_table,
    message_expr,
    aggregate_expr,
    result_schema,
    result_table,
    [ result_indexes [ , ... ] ]
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input tables. |
| `input_vertices_table` | str | Input vertices table (must have an `id` column). |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns). |
| `message_expr` | str | A SQL expression defining the message to send along each edge. The expression can reference source vertex columns as `a.*` , edge columns as `b.*` , and destination vertex columns as `c.*` . Example: `"b.amount"` |
| `aggregate_expr` | str | A SQL aggregation expression that combines the messages arriving at each vertex. Reference the value produced by the `message_expr` argument as `msg` , and |

| Argument | Data Type | Description |
| --- | --- | --- |
| | | name the result column with an `AS` alias. For a list of supported aggregations, see **Aggregate Functions**. Example: `"SUM(msg) AS total"` |
| `result_schema` | str | A writable schema to create the result tables. |
| `result_table` | str | Name of the result table to create. |
| `result_indexes` | List[str] | Optional. Columns to index in the result table (e.g., `id`). Specify an empty list for none. |

### Example

Compute the sum of incoming edge weights for each vertex.

Python

```
aggregate_messages(
    connection,
    "sales", "customers", "purchases",
    "b.amount",
    "SUM(msg) AS total_amount",
    "sales", "vertex_totals",
    ["id"],
)
```

## a_star_shortest_path

Computes the shortest path between a source and target vertex using the **A* search algorithm**. A* extends Dijkstra's algorithm with a specified heuristic expression that estimates the remaining cost to the target, guiding the search toward the goal, reducing the number of vertices explored, and stopping early if it reaches the number of iterations as specified by the `max_iterations` value.

The heuristic must be admissible, meaning it never overestimates the true cost, for the algorithm to guarantee an optimal path. The result table contains the `srcid`, `destid`, `cost`, and `path_index` columns, which represent the ordered nodes on the shortest path.

### Syntax

Python

```
a_star_shortest_path(
    connection,
    input_schema,
    input_vertices_table,
    input_edges_table,
    source_node_id,
    target_node_id,
    weight_col,
    heuristic_expr,
    result_schema,
    result_table,
    [ result_indexes [ , ... ] ],
    max_iterations,
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input tables. |
| `input_vertices_table` | str | Input vertices table (must have an `id` column). |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns). |
| `source_node_id` | int | The vertex identifier of the source node. |
| `target_node_id` | int | The vertex identifier of the target node. |
| `weight_col` | str | The name of the edge weight column. Specify `None` for unweighted graphs. The default weight is `1.0`. |
| `heuristic_expr` | str | A SQL expression that estimates the remaining cost from a vertex to the target. Reference vertex columns using the `v` alias, and substitute literal values for the target coordinates. For example, `"ABS(v.x - 10) + ABS(v.y - 20)"` is the Manhattan distance heuristic for the target at `(10, 20)`. |
| `result_schema` | str | A writable schema to create the result tables. |
| `result_table` | str | Name of the result table to create. |

| Argument | Data Type | Description |
| --- | --- | --- |
| `result_indexes` | List[str] | Optional. Columns to index in the result table (e.g., `srcid` and `destid`). Specify an empty list for none. |
| `max_iterations` | int | Optional. Maximum number of relaxation iterations that must be `1` or greater. Default: `10000`. |

### Example

Find the shortest path from vertex `1` to vertex `42` using edge weights and a coordinate-based heuristic.

Python

```
a_star_shortest_path(
    connection,
    "sales", "customers", "purchases",
    1, 42,
    "weight",
    "ABS(v.x - 10) + ABS(v.y - 20)",
    "sales", "astar_path",
    ["srcid", "destid"],
    100,
)
```

## yens_k_shortest_paths

Computes the `k` shortest loopless paths between a source and target vertex using **Yen's algorithm**. The algorithm iteratively finds the next shortest path by deviating from previously discovered paths at each spur node, using up to the number of Dijkstra iterations as specified by the `max_iterations` value for each spur-node search.

The result table contains the `path_id`, `srcid`, `destid`, `cost`, and `path_index` columns, which represent the ordered nodes on each path.

### Syntax

Python

```
yens_k_shortest_paths(
    connection,
    input_schema,
    input_vertices_table,
    input_edges_table,
    source_node_id,
    target_node_id,
    k,
    weight_col,
    result_schema,
    result_table,
    [ result_indexes [ , ... ] ],
    max_iterations,
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input tables. |
| `input_vertices_table` | str | Input vertices table (must have an `id` column). |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns). |
| `source_node_id` | int | The vertex identifier of the source node. |
| `target_node_id` | int | The vertex identifier of the target node. |
| `k` | int | The number of shortest paths to find. This value must be `1` or greater. |
| `weight_col` | str | The name of the edge weight column. Specify `None` for unweighted graphs. The default weight is `1.0`. |
| `result_schema` | str | A writable schema to create the result tables. |
| `result_table` | str | Name of the result table to create. |
| `result_indexes` | List[str] | Optional. Columns to index in the result table (e.g., `path_id` and `srcid`). Specify an empty list for none. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Argument | Data Type | Description |
| --- | --- | --- |
| `max_iterations` | int | Optional. Maximum number of Dijkstra iterations per sub-path that must be `1` or greater. Default: `10000`. |

### Example

Find the three shortest paths from vertex `1` to vertex `42` using edge weights.

Python

```
yens_k_shortest_paths(
    connection,
    "sales", "customers", "purchases",
    1, 42,
    3,
    "weight",
    "sales", "yen_paths",
    ["path_id", "srcid"],
    100,
)
```

## leiden_modularity_optimization

Detects communities using the **Leiden algorithm**, a refinement of the Louvain method that guarantees the formation of well-connected communities. The algorithm optimizes modularity through iterative local moves and a refinement phase that prevents poorly connected communities, repeating until modularity stops improving or until it reaches the number of rounds as specified by the `max_iterations` value.

The result table contains the `id` and `community` columns.

### Syntax

Python

```
leiden_modularity_optimization(
    connection,
    input_schema,
    input_vertices_table,
    input_edges_table,
    weight_col,
    resolution_param,
    result_schema,
    result_table,
    max_iterations,
    [ result_indexes [ , ... ] ],
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input tables. |
| `input_vertices_table` | str | Input vertices table (must have an `id` column). |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns). |
| `weight_col` | str | The name of the edge weight column. Specify `None` for unweighted graphs. The default weight is `1.0`. |
| `resolution_param` | float | Resolution parameter controlling the granularity of communities. Higher values produce more communities. A typical value is `1.0`. |
| `result_schema` | str | A writable schema to create the result tables. |
| `result_table` | str | Name of the result table to create (includes the `id` and `community` columns). |
| `max_iterations` | int | Maximum number of iterations that must be `1` or greater. |
| `result_indexes` | List[str] | Optional. Columns to index in the result table (e.g., `id`). Specify an empty list for none. |

## Example

Detect communities using the Leiden algorithm with a resolution of `1.0` and a maximum of 10 iterations.

Python

```
leiden_modularity_optimization(
    connection,
    "sales", "customers", "purchases",
    "weight",
    1.0,
    "sales", "leiden_communities",
    10,
    ["id"],
)
```

## time_respecting_shortest_path

Computes the shortest path between a source and target vertex while respecting the temporal ordering of edges. Each edge has a timestamp, and the algorithm traverses only edges whose timestamps are nondecreasing along the path, modeling real-world scenarios where events must occur in chronological order.

The timestamp column must be of `TIMESTAMP` type. The result table contains the `srcid`, `destid`, `cost`, and `path_index` columns.

### Syntax

Python

```
time_respecting_shortest_path(
    connection,
    input_schema,
    input_vertices_table,
    input_edges_table,
    source_node_id,
    target_node_id,
    time_col,
    weight_col,
    earliest_departure,
    max_wait_time,
    result_schema,
    result_table,
    [ result_indexes [ , ... ] ],
    max_iterations,
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input tables. |
| `input_vertices_table` | str | Input vertices table (must have an `id` column). |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns). |
| `source_node_id` | int | The vertex identifier of the source node. |
| `target_node_id` | int | The vertex identifier of the target node. |
| `time_col` | str | The name of the `TIMESTAMP` column on edges representing the event time. |
| `weight_col` | str | The name of the edge weight column. Specify `None` for unweighted graphs. The default weight is `1.0`. |
| `earliest_departure` | str | A `TIMESTAMP` literal specifying the earliest allowed departure time from the source. Example: `"2024-01-01 00:00:00"` |
| `max_wait_time` | Optional[int] | Optional. Maximum waiting time in seconds at any vertex. Specify `None` to wait indefinitely. |

| Argument | Data Type | Description |
|---|---|---|
| `result_schema` | str | A writable schema to create the result tables. |
| `result_table` | str | Name of the result table to create. |
| `result_indexes` | List[str] | Optional. Columns to index in the result table (e.g., `srcid` and `destid`). Specify an empty list for none. |
| `max_iterations` | int | Optional. Maximum number of relaxation iterations that must be `1` or greater. Default: `10000`. |

### Example

Find the time-respecting shortest path from vertex `1` to vertex `42` departing no earlier than midnight on January 1, 2024.

Python

```
time_respecting_shortest_path(
    connection,
    "sales", "customers", "purchases",
    1, 42,
    "event_time",
    "weight",
    "2024-01-01 00:00:00",
    None,
    "sales", "trsp_path",
    ["srcid", "destid"],
    100,
)
```

## temporal_page_rank

Computes **PageRank** scores using exponential time decay on edges. Recent edges contribute more to the ranking than older edges, making this algorithm suitable for graphs where recency matters (e.g., communication networks, transaction logs).

The time column must be of `TIMESTAMP` type. The algorithm supports both standard and personalized variants, similar to **static_page_rank**.

### Syntax

Python

```
temporal_page_rank(
    connection,
    input_schema,
    input_vertices_table,
    input_edges_table,
    time_col,
    decay_factor,
    reference_time,
    result_schema,
    result_vertices_table,
    num_iterations,
    damping_factor,
    [ result_vertices_indexes [ , ... ] ],
    personalization_src_id,
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input tables. |
| `input_vertices_table` | str | Input vertices table (must have an `id` column). |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns). |
| `time_col` | str | The name of the `TIMESTAMP` column on edges. |
| `decay_factor` | float | Controls the rate of exponential decay. A higher value causes older edges to lose influence faster. |
| `reference_time` | str | A `TIMESTAMP` literal specifying the reference point for computing time differences. Example: `"2024-12-31 23:59:59"` |
| `result_schema` | str | A writable schema to create the result tables. |
| `result_vertices_table` | str | Name of the vertices table to create (columns include all vertex columns and a `pagerank` column). |
| `num_iterations` | int | Number of iterations to run that must be `1` or greater. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Argument | Data Type | Description |
| --- | --- | --- |
| `damping_factor` | float | The damping factor, specified as a value between `0.0` and `1.0`. For details, see **static_page_rank**. |
| `result_vertices_indexes` | List[str] | Optional. Columns to index in the result vertices table (e.g., `id`). Specify an empty list for none. |
| `personalization_src_id` | Optional[int] | For the personalized mode, specify a vertex identifier. For the standard mode, specify `None`. |

### Example

Run temporal PageRank with a decay factor of `0.5` using a reference time of December 31, 2024.

Python

```
temporal_page_rank(
    connection,
    "sales", "customers", "purchases",
    "event_time",
    0.5,
    "2024-12-31 23:59:59",
    "sales", "temporal_pr",
    10,
    0.85,
    ["id"],
    None,
)
```

## random_walk

Generates configurable random walks from each vertex using **Node2Vec**-style biased sampling. The return parameter ( `p_return` argument) and in-out parameter ( `q_inout` argument) control whether the walk favors revisiting the previous node (breadth-first) or exploring further (depth-first).

The result table contains the `walk_id`, `step`, and `node_id` columns.

### Syntax

Python

```
random_walk(
    connection,
    input_schema,
    input_vertices_table,
    input_edges_table,
    walk_length,
    num_walks_per_node,
    p_return,
    q_inout,
    result_schema,
    result_table,
    [ result_indexes [ , ... ] ],
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input tables. |
| `input_vertices_table` | str | Input vertices table (must have an `id` column). |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns). |
| `walk_length` | int | Length of each random walk (number of steps). |
| `num_walks_per_node` | int | Number of walks to generate from each vertex. |
| `p_return` | float | Return parameter, where a lower value makes the walk more likely to return to the previous node (breadth-first behavior). |
| `q_inout` | float | In-out parameter, where a lower value makes the walk more likely to explore further from the previous node (depth-first behavior). |
| `result_schema` | str | A writable schema to create the result tables. |
| `result_table` | str | Name of the result table to create (includes the `walk_id`, `step`, and `node_id` columns). |
| `result_indexes` | List[str] | Optional. Columns to index in the result table (e.g., `walk_id`). Specify an empty list for none. |

© 2026 Ocient, Inc

### Example

Generate five random walks of length 10 from each vertex using Node2Vec-style parameters.

Python

```
random_walk(
    connection,
    "sales", "customers", "purchases",
    10,
    5,
    1.0,
    1.0,
    "sales", "walks",
    ["walk_id"],
)
```

## fast_random_projection

Generates node embeddings using the **Fast Random Projection** (FastRP) algorithm. FastRP creates low-dimensional vector representations of vertices by iteratively averaging neighbor embeddings with sparse random projections. These embeddings are useful as features for downstream machine learning tasks.

The result table contains the `id` and `embedding` columns. The `embedding` column is a vector with length equal to the `embedding_dim` value.

### Syntax

Python

```
fast_random_projection(
    connection,
    input_schema,
    input_vertices_table,
    input_edges_table,
    embedding_dim,
    iterations,
    normalize,
    result_schema,
    result_table,
    [ result_indexes [ , ... ] ],
)
```

| Argument | Data Type | Description |
|---|---|---|
| `connection` | pyocient.Connection | An active database connection using the `pyocient` module. |
| `input_schema` | str | A non-empty schema containing the input tables. |
| `input_vertices_table` | str | Input vertices table (must have an `id` column). |
| `input_edges_table` | str | Input edges table (must have the `srcid` and `destid` columns). |
| `embedding_dim` | int | Dimensionality of the output embedding vectors. |
| `iterations` | int | Number of neighbor-averaging iterations. Higher values capture more distant structural information. |
| `normalize` | bool | If you set this argument to `True`, the function scales each embedding vector to unit length using the L2 norm. |
| `result_schema` | str | A writable schema to create the result tables. |
| `result_table` | str | Name of the result table to create (includes the `id` and `embedding` columns). |
| `result_indexes` | List[str] | Optional. Columns to index in the result table (e.g., `id`). Specify an empty list for none. |

## Example

Generate 64-dimensional normalized embeddings with three iterations.

Python

```
fast_random_projection(
    connection,
    "sales", "customers", "purchases",
    64,
    3,
    True,
    "sales", "embeddings",
    ["id"],
)
```

# Ingest Data with Legacy LAT Reference

(deprecated) Explore methods for efficiently loading large data sets into Ocient, optimized for performance and designed for massive-scale data warehousing.

> ⚠ Data Pipelines are now the preferred method for loading data into the Ocient® System. For details, see **Load Data**. The LAT loading functionality will be removed in version 29.0.

## Loading and Transformation (LAT) Overview

This section provides an overview of how loading works in Ocient along with step-by-step examples to illustrate the key aspects of the loading process. A separate LAT Reference provides a detailed explanation of the options for each data format and data source in Ocient.

The key elements in the Loading system are:

- Data Source — an origin source for data such as Amazon® Web Services℠ (AWS℠) S3, Apache® Kafka®, or Apache® Hadoop® Distributed File System (HDFS). Sources can be file or streaming in nature.
- Data Type Extraction — the format for data extraction from the source. Examples include JSON, CSV, fixed width.
- Transformations — the functions used to cleanse, route, and transform the incoming data.
- Indexer — operated by the `streamloader` role on a Loader Node, the Indexer collects transformed records, stores in replicated pages, and converts into segments on the Foundation Nodes.

## Loading Overview

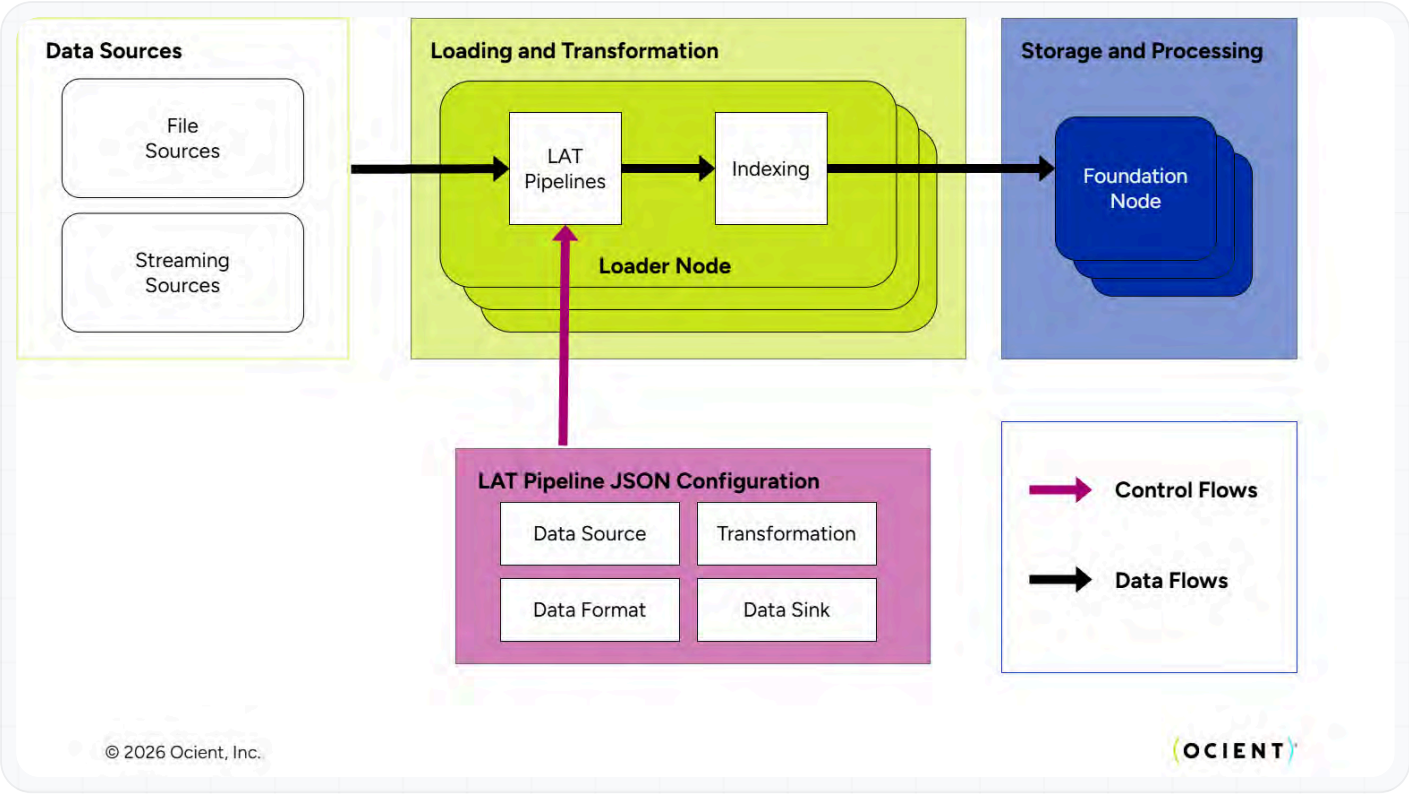
The LAT is a service within an Ocient System that is responsible for fetching data from file or streaming sources, extracting records, transforming them, and routing them to Ocient tables. The LAT runs as a standalone Java® process on Loader Nodes. It runs many parallel workers on high-core count servers to deliver the required parallelism for high-throughput loading. This diagram shows that a set of Loader Nodes sit between the data sources and the Foundation Nodes to control the loading flow and deliver high performance across many parallel workers.

The LAT loads data from two general types of data sources:

- Streaming Sources — continuous loading of data from an ordered stream such as Kafka
- File Sources — a discrete batch of data loaded from files until complete, typically from a file system or object storage solution like AWS S3

The main difference between these modes is whether the task continues indefinitely or ends when the batch of files has been loaded. In both cases, the LAT uses identical transformation and loading processes so that users can manage both with the same mental model and configuration files. Most data types are supported identically in streaming and batch processing modes, however some formats are not suitable for streaming due to their structure.

A complete list of data sources and supported data formats is in **LAT Data Types in Loading**.



While loading, the LAT coordinates with the Ocient System to manage backpressure of loading new records. New rows accumulate into a storage structure called a “page” which is a column-oriented storage mechanism. These pages are replicated across Foundation Nodes so that the specified redundancy is maintained in the event of a system outage. When enough pages have accumulated in a given time period (as defined by the TimeKey® bucket), the Indexer will convert the pages into segment structures and place these on the Foundation Nodes for permanent storage as Segment Groups that span the width of the storage space.

This process is transparent to analysts issuing queries. Rows are federated during queries so that pages and Segments are seamlessly presented in result sets.

## Pipelines Overview

The process and configuration that defines how data is loaded is referred to as a “pipeline.” A “pipeline” defines the end-to-end data flow in a loading task including the Source type (e.g., Kafka), the record Extraction for the data type (e.g., CSV extraction), the transformations on each record (e.g., JSON value extraction, data exploding, string concatenation, flattening), and where transformed data should be loaded in Ocient tables. As shown in this diagram, a user sets each of these sections in the pipeline file to control the LAT.

© 2026 Ocient, Inc

The LAT pipelines are managed through an HTTP API on the Loader Nodes or through a Command Line Interface (CLI) that provides a convenient way to work with the HTTP API. Because most Ocient Systems include many Loader Nodes, the CLI coordinates pipelines across the specified set of Loader Nodes.

The LAT Client issues the command to the Loader Node to create the new pipeline with the pipeline configuration file. When started, the LAT uses the pipeline to execute a highly parallelized loading task across all Loader Nodes and Foundation Nodes to load the configured tables.

Detailed instructions for configuring a pipeline are found in **LAT Pipeline Configuration**.

## Time Ordering

The Ocient System contains timeseries data. Loading in the data warehouse is considerably faster when data is presented in an ordered time sequence according to the TimeKey in a table. For most streaming sources, this is typically accomplished automatically with limited “out of order” data by the nature of the queue.

However, for file based sources, it is not uncommon for data to be collected in folders in a manner that could appear haphazard to the loader. For this reason, it is critical that

the `sort_type` setting for file based sources be used correctly to inform the LAT how files should be ordered.

Read more about file sorting in **Load From a File Source**.

## Exactly-Once Guarantees

Loading in Ocient is designed to ensure exactly once processing of data. The LAT operates independent streams of data that each has a monotonically increasing row ID tied to an individual row in a File-based load or a partition offset in a Kafka-based load. Exactly-once processing is made possible through coordination between the loading components around a “Durability Horizon” that represents the highest record durably stored on non-volatile storage in each independent stream. In the event of a node outage or a replay of the data, the Durability Horizon automatically removes duplicate records in an efficient manner.

It is important to understand how the LAT determines the unique row ID for different source types to ensure that data is loaded correctly. This is described in more detail in the LAT Reference Documentation.

Learn more about the underlying approach used in **Loading Characteristics and Concepts**.

## Dynamic Schema Changes

Ocient also supports schema changes on tables while loading data in a continuously streaming pipeline. Ocient maintains a table version with each running pipeline that serves as a loading contract until the load task complete. This ensures that existing pipelines are not interrupted when columns are added or removed from a table that is receiving new data. Ocient continues loading records using the original table version even after a change has been made to the tables. These dynamic schema changes from `ALTER TABLE` commands allow flexible updates to tables while complex loading processes are active. Pipelines can then be updated to add or remove data elements and match the altered schema, reducing the burden of coordination across systems.

## Loading Examples

The following examples walk through a simple loading example using the LAT for a streaming load off of Kafka and a file load off of S3. These examples are very similar due to the way the LAT uses a common language for all transformation and loading regardless of data source or data type. The final set of examples outline some more complex transformations.

Examples:

- **LAT Load JSON Data from Kafka**
- **LAT Load CSV Data from S3**
- **LAT Load JSON Data from S3**
- **LAT Advanced Loading and Transformations**

For more detailed information about LAT settings, see the **LAT Pipeline Configuration**.

# LAT Load JSON Data from Kafka

(deprecated) Ingest JSON data from Apache Kafka into Ocient with a LAT pipeline. This tutorial covers source, transform, and sink configuration plus monitoring options.

⚠ Data Pipelines are now the preferred method for loading data into the Ocient® System. For details, see **Load Data**. The LAT loading functionality will be removed in version 29.0.

A common setup for streaming data into Ocient is to send JSON documents to Apache® Kafka® and then transform each document into rows in one or more different tables. Ocient's Loading and Transformation capabilities use a simple SQL-like syntax for transforming data. This tutorial will guide users through a simple example load using a small set of data in JSON format. The data in this example is created from a test set for the Metabase℠ Business Intelligence tool.

## Prerequisites

This tutorial assumes that:

1. A Kafka cluster is operational and can be reached by the Ocient Loader Nodes.
2. An Ocient System is installed and configured with an active storage cluster (See the **Ocient Application Configuration** guide).
3. The Ocient Loader Nodes are running the latest Loading and Transformation version which is configured to connect to Kafka for stream loading.
4. A default "sink" for the Ocient Loader Nodes is configured on the system.
5. The **LAT Client Command Line Interface** is installed.
6. The test data for this Tutorial can be found at the following S3 addresses.

© 2026 Ocient, Inc

You must be logged into Amazon® Web Services℠ (AWS℠) to download these files.

`https://ocient-docs.s3.amazonaws.com/metabase_samples/jsonl/orders.jsonl`
`https://ocient-docs.s3.amazonaws.com/metabase_samples/jsonl/products.jsonl`
`https://ocient-docs.s3.amazonaws.com/metabase_samples/jsonl/people.jsonl`
`https://ocient-docs.s3.amazonaws.com/metabase_samples/jsonl/reviews.jsonl`

## Step 1: Create a New Database

To begin, you are going to load four example tables in a database. First, connect to a SQL Node using the **Commands Supported by the Ocient JDBC CLI Program**. Then run the following DDL command:

SQL

```
CREATE DATABASE metabase;
```

## Step 2: Create Tables

To create tables in the new database, first connect to that database (e.g., `connect to jdbc:ocient://sql-node:4050/metabase`), then run the following DDL commands:

SQL

```sql
CREATE TABLE public.orders (
  created_at TIMESTAMP TIME KEY BUCKET(1, DAY) NOT NULL,
  id INT NOT NULL,
  user_id INT NOT NULL,
  product_id INT NOT NULL,
  subtotal DOUBLE,
  tax DOUBLE,
  total DOUBLE,
  discount DOUBLE,
  quantity INT,
  CLUSTERING INDEX idx01 (user_id, product_id)
);

CREATE TABLE public.people (
  created_at TIMESTAMP TIME KEY BUCKET(1, DAY) NOT NULL,
  id INT NOT NULL,
  address VARCHAR(255),
  email VARCHAR(255),
  password VARCHAR(255),
  name VARCHAR(255),
  city VARCHAR(255),
  longitude DOUBLE,
  state VARCHAR(255),
  source VARCHAR(255),
  birth_date DATE,
  zip VARCHAR(255),
  latitude DOUBLE,
  CLUSTERING INDEX idx01 (id)
);

CREATE TABLE public.products(
  created_at TIMESTAMP TIME KEY BUCKET(1, DAY) NOT NULL,
  id INT NOT NULL,
  ean VARCHAR(255),
  title VARCHAR(255),
  category VARCHAR(255) COMPRESSION GDC(2) NOT NULL,
  vendor VARCHAR(255),
  price DOUBLE,
  rating DOUBLE,
  CLUSTERING INDEX idx01 (category)
);
```

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

```
CREATE TABLE public.reviews (
  created_at TIMESTAMP TIME KEY BUCKET(1, DAY) NOT NULL,
  id INT NOT NULL,
  product_id INT NOT NULL,
  reviewer VARCHAR(255),
  rating INT,
  body VARCHAR(255),
  CLUSTERING INDEX idx01 (product_id)
);
```

Now, the database tables are created, and you can begin loading data.

## Step 3: Create a Data Pipeline

Data pipelines are created using a simple loading configuration that is submitted to the Transformation Nodes to start loading. Each Kafka topic is routed to one or more Ocient tables, and each column is the result of a transformation applied to the source document.

First, inspect the data that you load. Each document has a format similar to the following example.

JSON

```
/* orders */
{"id": 1, "user_id": 1, "product_id": 14, "subtotal": 37.65, "tax": 2.07, "total'
{"id": 2, "user_id": 1, "product_id": 123, "subtotal": 110.93, "tax": 6.1, "tota]
...

/* products */
{"id": 1, "ean": "1018947080336", "title": "Rustic Paper Wallet", "category": "Gi
{"id": 2, "ean": "7663515285824", "title": "Small Marble Shoes", "category": "Doc
{"id": 3, "ean": "4966277046676", "title": "Synergistic Granite Chair", "category
...

/* people */
{"id": 1, "address": "9611-9809 West Rosedale Road", "email": "borer-hudson@yahoc
{"id": 2, "address": "101 4th Street", "email": "williamson-domenica@yahoo.com",
{"id": 3, "address": "29494 Anderson Drive", "email": "lina.heaney@yahoo.com", "p
...

/* reviews */
{"id": 1, "product_id": 1, "reviewer": "christ", "rating": 5, "body": "Ad perspic
{"id": 2, "product_id": 1, "reviewer": "xavier", "rating": 4, "body": "Reprehende
{"id": 3, "product_id": 1, "reviewer": "cameron.nitzsche", "rating": 5, "body": '
...
```

As you can see, this is similar to the target schema, but will require some transformation. Most transformations are identical to functions already in Ocient's SQL dialect. To route data to your tables, you must create a pipeline.json file that has the following structure:

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

JSON

```
{
    "version": 2,
    "workers": 4,
    "pipeline_id": "pipeline-metabase",
    "source": {
        "type": "kafka",
        "kafka": {
          "bootstrap.servers": "127.0.0.1:9092",
          "auto.offset.reset": "earliest"
        }
    },
    "transform": {
        "topics": {
            "orders": {
                "tables": {
                    "metabase.public.orders": {
                        "columns": {
                            "id": "id",
                            "user_id": "user_id",
                            "product_id": "product_id",
                            "subtotal": "subtotal",
                            "tax": "tax",
                            "total": "total",
                            "discount": "discount",
                            "created_at": "to_timestamp(created_at, 'yyyy-MM-dd\\
                            "quantity": "quantity"
                        }
                    }
                }
            },
            "people": {
                "tables": {
                    "metabase.public.people": {
                        "columns": {
                            "id": "id",
                            "address": "address",
                            "email": "email",
                            "password": "password",
                            "name": "name",
                            "city": "city",
                            "longitude": "longitude",
```

```
                            "state": "state",
                            "source": "source",
                            "birth_date": "birth_date",
                            "zip": "zip",
                            "latitude": "latitude",
                            "created_at": "to_timestamp(created_at, 'yyyy-MM-dd\'
                        }
                    }
                }
            },
            "reviews": {
                "tables": {
                    "metabase.public.reviews": {
                        "columns": {
                            "id": "id",
                            "product_id": "product_id",
                            "reviewer": "reviewer",
                            "rating": "rating",
                            "body": "body",
                            "created_at": "to_timestamp(created_at, 'yyyy-MM-dd\'
                        }
                    }
                }
            },
            "products": {
                "tables": {
                    "metabase.public.products": {
                        "columns": {
                            "id": "id",
                            "ean": "ean",
                            "title": "title",
                            "category": "category",
                            "vendor": "vendor",
                            "price": "price",
                            "rating": "rating",
                            "created_at": "to_timestamp(created_at, 'yyyy-MM-dd\'
                        }
                    }
                }
            }
        }
    }
}
```

## Step 4: Using the Loading and Transformation CLI

With a pipeline.json file ready to go, you can test this pipeline. To test, use the LAT CLI. For these examples, you can assume that two LATs are configured and will set them using an environment variable.

First, configure the LAT CLI to use the hosts of your Loading and Transformation service. You can add these to every CLI command as a flag, but for simplicity you can also set them as environment variables. From a command line, run the following command replacing the IP addresses with the IP addresses of your LAT processes:

Shell

```
export LAT_HOSTS="https://10.0.0.1:8443,https://10.0.0.2:8443"
```

If your LAT is running without TLS configured, replace the port number of your LAT Hosts with 8080 and the protocol with `http://`.

Next, check on the status of the LAT:

Shell

```
lat_client pipeline status
```

**Example response:**

Bash

```
10.0.0.1:8443: Stopped
10.0.0.2:8443: Stopped
```

Success! This confirms that you can reach the LAT from your CLI. If the status is “Running” it means a pipeline is already executing a pipeline. You are next going to update and start your new pipeline.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

This example uses secure connections. If you receive an SSL Error when testing, your service cannot be configured to use TLS or you might need to use the `--no-verify` flag if certificate validation fails.

## Step 5: Test the Transformation

The CLI supports previewing a transformation with an example document and the pipeline file. This makes it easy to test your transformations.

First, save an example document to your file system to use for this test. For this demo, you can download an example file from **https://ocient-docs.s3.amazonaws.com/metabase_samples/jsonl/orders.jsonl** and save it to `~/orders.jsonl`.

Next, make sure the pipeline.json file that you created is stored at `~/pipeline.json`.

Now that both files are available, run the CLI to preview the results. You can pass the preview command the topic name, the pipeline file, and the sample record file. The response contains the transformed data tied to the destination table and a list of any error records.

Shell

```
lat_client preview --topic orders --pipeline ~/pipeline.json --records ~/orders.j
```

Example response:

JSON

```
{
    "tableRecords": {
        "metabase.public.orders": [
            {
                "id": 1,
                "user_id": 1,
                "product_id": 14,
                "subtotal": 37.65,
                "tax": 2.07,
                "total": 39.72,
                "discount": null,
                "created_at": 1549921227892000000,
                "quantity": 2
            },
            {
                "id": 2,
                "user_id": 1,
                "product_id": 123,
                "subtotal": 110.93,
                "tax": 6.1,
                "total": 117.03,
                "discount": null,
                "created_at": 1526371444580000000,
                "quantity": 3
            },
            {
                "id": 3,
                "user_id": 1,
                "product_id": 105,
                "subtotal": 52.72,
                "tax": 2.9,
                "total": 49.2,
                "discount": 6.42,
                "created_at": 1575670968544000000,
                "quantity": 2
            }
        ]
    },
    "recordErrors": []
}
```

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

You can see that the data is transformed and the columns to which each transformed value will be mapped. If there are issues in the values, these will appear in the `recordErrors` object. You can quickly update your pipeline.json file and preview again. Now, you can inspect different documents to confirm that various states of data cleanliness like missing columns, null values, and special characters are well handled by your transformations.

## Step 6: Configure and Start the Data Pipeline

With a tested transformation, the next step is to set up and start the data pipeline.

First, configure the pipeline using the `pipeline create` command. This validates and creates the pipeline, but will not take effect until you start the pipeline:

Shell

```
lat_client pipeline create --pipeline ~/pipeline.json
```

Example response:

Bash

```
10.0.0.1:8443: Created
10.0.0.2:8443: Created
```

> In cases where there is an existing pipeline operating, it is necessary to stop the pipeline and remove the original pipeline before creating and starting the new pipeline.

Now that the pipeline has been created on all LAT Nodes, you can start the LAT by running the `pipeline start` commands:

Shell

```
lat_client pipeline start
```

Example responses:

Bash

```
10.0.0.1:8443: Running
10.0.0.2:8443: Running
```

# Step 7: Confirm that Loading is Operating Correctly

With your pipeline in place and running, data will immediately begin loading off of the Kafka topics that are configured in the pipeline. If you do not have data in the Kafka topics yet, now would be a good time to start producing data into the topics.

## Producing Test Data into Kafka:

For test purposes, **kafkacat** is a helpful utility that makes it easy to product records into a topic. For example, if you have a file of sample data `orders.jsonl` in a JSONL format (newline delimited JSON records), you can run the following command to send those records into your Kafka broker:

Shell

```
kafkacat -b <broker_ip_address>:9092 -t <topic_name> -T -P -l orders.jsonl
```

Assuming your broker is running at `10.0.0.3` and you want to send data into the four topics defined in your `pipeline.json` definition, you can run:

Shell

```
kafkacat -b 10.0.0.3:9092 -t orders -T -P -l orders.jsonl
kafkacat -b 10.0.0.3:9092 -t products -T -P -l products.jsonl
kafkacat -b 10.0.0.3:9092 -t people -T -P -l people.jsonl
kafkacat -b 10.0.0.3:9092 -t reviews -T -P -l reviews.jsonl
```

Each of these commands will push the entire JSONL file of messages into Kafka with one record per line. As these are produced into Kafka, your running pipeline will begin loading them into Ocient.

## Observing Loading Progress:

With data in Kafka, our pipeline will begin loading data immediately and streaming any new data into Ocient. To observe this progress, you can monitor the metrics endpoint of the Loading and Transformation Nodes. This can be done manually from a command line or from a tool like Grafana®. For this example, you can run a `curl` command against the endpoint and review the result. For details on metrics, see the **LAT Metrics** Documentation.

**Command:**

CURL

```
curl https://127.0.0.1:8443/v2/metrics/lat:type=pipeline
```

If your LAT is running without TLS configured, replace the port number of your LAT Hosts with 8080 and the protocol with `http://` .

**Example response:**

JSON

```
{
  "request": {
  "mbean": "lat:type=pipeline",
  "type": "read"
  },
  "value": {
  "partitions": [
    {

## Check Row Counts in Tables:

To confirm that you are seeing results in the target tables, you can also run some simple queries to check row counts. Depending on the streamloader role settings, the time for records to become queryable can vary from a few seconds to minutes:

### Example Queries:

SQL

```
Ocient> SELECT count(*) FROM public.orders;
count(*)
------------------------
18760
```

SQL

```
Ocient> SELECT count() FROM public.people;
count()
-----------------------
2500
```

SQL

```
Ocient> SELECT count(*) FROM public.products;
count(*)
--------------------
200
```

SQL

```
Ocient> SELECT count(*) FROM public.reviews;
count(*)
--------------------
1112
```

Success! Now you can explore the data in these four tables with any Ocient SQL queries. If more data is pushed into these topics, your pipeline is still running and will automatically load all new data.

## Check Errors

In this example, all rows load successfully. However, a successful load does not always happen, and you can inspect errors using the LAT Client. Whenever the LAT process fails to parse a file correctly or fails to transform or load a record, the LAT process records an error. The LAT Client includes the `lat_client pipeline errors` command that reports the latest errors on the pipeline.

A full error log is available on the Loader Nodes. These logs report all bad records and the reason that the load fails.

> When you load a pipeline from Kafka, the load might route errors to an error topic on the Kafka broker instead of the logs. The LAT Client does not contain the errors sent to the error topic. You can inspect these errors with Kafka utilities instead.

This LAT Client command displays a maximum of 100 error messages.

```
lat_client pipeline errors --max-errors 100 --only-error-messages

|--------------------------------------------------|
| exception_message                                |
|--------------------------------------------------|
| Column name: time1. Message: Failed to evaluate  |
| expression. Cause:                               |
| java.time.format.DateTimeParseException          |
|--------------------------------------------------|
| Column name: time1. Message: Failed to evaluate  |
| expression. Cause:                               |
| java.time.format.DateTimeParseException          |
|--------------------------------------------------|
```

The errors indicate that there is an issue parsing the `time1` column. Options exist on the `pipeline errors` command to return JSON and to restrict the response to specific

components of the error detail that includes a reference to the source location of this record.

The following command returns JSON that is delimited with newline characters. You can pass the JSON output to `jq` or a file. The JSON includes the source topic or file group, the filename where the error occurred, the offset that indicates the line number or Kafka offset, and the exception message that aids in troubleshooting and identifying the incorrect record in the source data. You can use the `log_original_message` pipeline setting to provide direct access to the parsed source record for errors when appropriate.

```
lat_client pipeline errors --max-errors 100 --json

{"time": "2022-05-17T16:53:50.387386+00:00", "topic": "calcs", "partition": 0, "s
{"time": "2022-05-17T16:53:50.404684+00:00", "topic": "calcs", "partition": 0, "s
```

# LAT Load CSV Data from S3

(deprecated) Learn to load CSV data from Amazon S3 directly into Ocient's high-performance data warehouse, ensuring smooth and scalable data integration.

⚠ Data Pipelines are now the preferred method for loading data into the Ocient® System. For details, see **Load Data**. The LAT loading functionality will be removed in version 29.0.

A common setup for batch loading files into Ocient is to load from a bucket on Amazon® Web Services℠ (AWS℠) S3 with time partitioned data. In many instances, a batch load is performed on a recurring basis to load new files. The LAT transforms each document into rows in one or more different tables. Ocient's Loading and Transformation capabilities use a simple SQL-like syntax for transforming data. This tutorial will guide users through a simple example load using a small set of data in CSV format. The data in this example is created from a test set for the Metabase℠ Business Intelligence tool.

## Prerequisites

This tutorial assumes that:

1. The Ocient System has network access to S3 from the Loader Nodes.
2. An Ocient System is installed and configured with an active storage cluster (See the **Ocient Application Configuration** guide).
3. Loading and Transformation is installed on the Loader Nodes.
4. A default "sink" for the Ocient Loader Nodes is configured on the system.
5. The **LAT Client Command Line Interface** is installed.

## Step 1: Create a New Database

To begin, load two example tables in a database. First, connect to a SQL Node using the **Commands Supported by the Ocient JDBC CLI Program**. Then run the following

DDL command:

```sql
CREATE DATABASE metabase;
```

## Step 2: Create Tables

To create tables in the new database, first connect to that database (e.g., `connect to jdbc:ocient://sql-node:4050/metabase`), then run the following DDL commands:

```sql
CREATE TABLE public.orders (
  created_at TIMESTAMP TIME KEY BUCKET(1, DAY) NOT NULL,
  id INT NOT NULL,
  user_id INT NOT NULL,
  product_id INT NOT NULL,
  subtotal DOUBLE,
  tax DOUBLE,
  total DOUBLE,
  discount DOUBLE,
  quantity INT,
  CLUSTERING INDEX idx01 (user_id, product_id)
);

CREATE TABLE public.products(
  created_at TIMESTAMP TIME KEY BUCKET(1, DAY) NOT NULL,
  id INT NOT NULL,
  ean VARCHAR(255),
  title VARCHAR(255),
  category VARCHAR(255) COMPRESSION GDC(2) NOT NULL,
  vendor VARCHAR(255),
  price DOUBLE,
  rating DOUBLE,
  CLUSTERING INDEX idx01 (category)
);
```

Now, the database tables are created and you can begin loading data.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

# Step 3: Create a Data Pipeline

Data pipelines are created using a simple loading configuration that is submitted to the Transformation Nodes to start loading. File Groups designate a batch of files to load. Each File Group is routed to one or more Ocient tables, and each column is the result of a transformation applied to the source document.

First, inspect the data that you plan to load. Each document has a format similar to the following example:

Text

```
/* orders */
id,user_id,product_id,subtotal,tax,total,discount,created_at,quantity
1,1,14,37.65,2.07,39.72,null,2019-02-11T21:40:27.892Z,2
2,1,123,110.93,6.1,117.03,null,2018-05-15T08:04:04.580Z,3
3,1,105,52.72,2.9,49.2,6.42,2019-12-06T22:22:48.544Z,2
...

/* products */
id,ean,title,category,vendor,price,rating,created_at
1,1018947080336,Rustic Paper Wallet,Gizmo,"Swaniawski, Casper and Hilll",29.46,4.
2,7663515285824,Small Marble Shoes,Doohickey,Balistreri-Ankunding,70.08,0,2019-04
3,4966277046676,Synergistic Granite Chair,Doohickey,"Murray, Watsica and Wunsch",
...
```

This is similar to the target schema created in Step 2, but it will require some transformation. Most transformations are identical to functions already in Ocient's SQL dialect. To route data to the tables, you need to create a pipeline.json file that has the following structure:

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

JSON

```
{
    "version": 2,
    "workers": 4,
    "source": {
        "compression": "none",
        "type": "s3",
        "endpoint": "https://s3.us-east-1.amazonaws.com",
        "bucket": "ocient-docs",
        "file_groups": {
            "orders": {
                "prefix": "metabase_samples/csv",
                "file_matcher_syntax": "glob",
                "file_matcher_pattern": "**orders*.csv",
                "sort_type": "lexicographic"
            },
            "products": {
                "prefix": "metabase_samples/csv",
                "file_matcher_syntax": "glob",
                "file_matcher_pattern": "**products*.csv",
                "sort_type": "lexicographic"
            }
        }
    },
    "extract": {
        "orders": {
            "record_type": "delimited",
            "headers": [
                "id",
                "user_id",
                "product_id",
                "subtotal",
                "tax",
                "total",
                "discount",
                "created_at",
                "quantity"
            ],
            "null_strings": [
                "NULL",
                "N/A"
            ],
```

```
            "record_delimiter": "\r\n",
            "num_header_lines": 1
        },
        "products": {
            "record_type": "delimited",
            "headers": [
                "id",
                "ean",
                "title",
                "category",
                "vendor",
                "price",
                "rating",
                "created_at"
            ],
            "record_delimiter": "\r\n",
            "num_header_lines": 1
        }
    },
    "transform": {
        "file_groups": {
            "orders": {
                "tables": {
                    "metabase.public.orders": {
                        "columns": {
                            "id": "id",
                            "user_id": "user_id",
                            "product_id": "product_id",
                            "subtotal": "subtotal",
                            "tax": "tax",
                            "total": "total",
                            "discount": "discount",
                            "created_at": "to_timestamp(created_at, 'yyyy-MM-dd\'
                            "quantity": "quantity"
                        }
                    }
                }
            },
            "products": {
                "tables": {
                    "metabase.public.products": {
                        "columns": {
                            "id": "id",
```

```
                        "ean": "ean",
                        "title": "title",
                        "category": "category",
                        "vendor": "vendor",
                        "price": "price",
                        "rating": "rating",
                        "created_at": "to_timestamp(created_at, 'yyyy-MM-dd\'
                    }
                }
            }
        }
    }
}
```

The two interesting parts of this pipeline.json file are the way the file groups and the extraction settings are defined.

First, note that each file group sets the S3 endpoint, a bucket, a prefix used for filtering the considered files, and then a file matcher. In this example, there is only a single file, but if there were many files matching the pattern `**orders*.csv` then they would all be part of the file group. You do not need S3 credentials because this is a public bucket, but if it were private, you can supply credentials in a few different ways.

Next, note the extract section. Here, the example specifies a delimited format. If it were compressed (e.g., gzip), you could specify compression. The example also specifies the headers to associate with each column in the CSV data. Delimited extracts can specify different record delimiters (e.g., `\n`), specify field delimiters (e.g., `|`, `\t`, `,`), define how to handle empty fields or to trim whitespace, and specify strings that should be considered `NULL`. While not used in this file, an example of null strings is provided that would turn the string literal “NULL” or “N/A” into a database `NULL`.

The final parameter supplied in the example is the sort type for the file load. This informs the LAT how you would like data to be ordered when loading. The ideal sort organizes files in time order according to the defined TimeKey®. This makes more efficient segments and is much faster to load. This example uses the lexicographic sort which orders according to the characters in the filename. Other sort types are available

to use file modified time or to extract the timestamp for sorting from the file path or filename.

## Step 4: Using the Loading and Transformation CLI

With a pipeline.json file ready to go, you can test this pipeline. To test, use the LAT CLI. For these examples, assume that two LATs are configured and set using an environment variable.

First, configure the LAT CLI to use the hosts of the Ocient Loading and Transformation service. You can add these to every CLI command as a flag, but for simplicity you can also set them as environment variables. From a command line, run the following command replacing the IP addresses with the IP addresses of your LAT processes:

Shell

```
export LAT_HOSTS="https://10.0.0.1:8443,https://10.0.0.2:8443"
```

If your LAT is running without TLS configured, replace the port number of your LAT Hosts with 8080 and the protocol with `http://`.

Next, check on the status of the LAT:

Shell

```
lat_client pipeline status
```

**Example response:**

Bash

```
10.0.0.1:8443: Stopped
10.0.0.2:8443: Stopped
```

Success! This confirms that you can reach the LAT from your CLI. If the status is “Running” it means a pipeline is already executing a pipeline. In the next step, you will

update and start the new pipeline.

This example uses secure connections. If you receive an SSL Error when testing, your service cannot be configured to use TLS or you might need to use the `--no-verify` flag if certificate validation fails.

## Step 5: Test the Transformation

The CLI supports previewing a transformation with an example document and the pipeline file. This makes it easy to test your transformations.

First, save an example document to your file system to use for this test. For this demo, you can download an example file from **https://ocient-docs.s3.amazonaws.com/metabase_samples/csv/orders.csv** and save it to `~/orders.csv`.

Next, make sure the pipeline.json file that you created is stored at `~/pipeline.json`.

Now that both files are available, you can run the CLI to preview the results. Pass the preview command the topic name, the pipeline file, and the sample record file. The response contains the transformed data tied to the destination table and a list of any error records.

Similar to how you can preview records on a Apache® Kafka® topic for file loads, you can supply any one `file_groups` created in the extract section to preview the transformations.

Shell

```
lat_client preview --topic orders --pipeline ~/pipeline.json --records ~/orders.c
```

**Example response:**

JSON

```
{
    "tableRecords": {
        "metabase.public.orders": [
            {
                "id": 1,
                "user_id": 1,
                "product_id": 14,
                "subtotal": 37.65,
                "tax": 2.07,
                "total": 39.72,
                "discount": null,
                "created_at": 1549921227892000000,
                "quantity": 2
            },
            {
                "id": 2,
                "user_id": 1,
                "product_id": 123,
                "subtotal": 110.93,
                "tax": 6.1,
                "total": 117.03,
                "discount": null,
                "created_at": 1526371444580000000,
                "quantity": 3
            },
            {
                "id": 3,
                "user_id": 1,
                "product_id": 105,
                "subtotal": 52.72,
                "tax": 2.9,
                "total": 49.2,
                "discount": 6.42,
                "created_at": 1575670968544000000,
                "quantity": 2
            }
        ]
    },
    "recordErrors": []
}
```

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

You can see that the data is transformed and the columns to which each transformed value will be mapped. If there are issues in the values, these will appear in the `recordErrors` object. You can quickly update the pipeline.json file and preview again. Now, you can inspect different documents to confirm that various states of data cleanliness like missing columns, null values, and special characters are well handled by your transformations.

## Step 6: Configure and Start the Data Pipeline

With a tested transformation, the next step is to setup and start the data pipeline.

First, configure the pipeline using the `pipeline create` command. This validates and creates the pipeline, but will not take effect until you start the pipeline:

Shell

```
lat_client pipeline create --pipeline ~/pipeline.json
```

**Example response:**

Bash

```
10.0.0.1:8443: Created
10.0.0.2:8443: Created
```

ⓘ In cases where there is an existing pipeline operating, it is necessary to stop the pipeline and remove the original pipeline before creating and starting the new pipeline.

Now that the pipeline has been created on all LAT Nodes, you can start the LAT by running the `pipeline start` commands:

Shell

```
lat_client pipeline start
```

**Example responses:**

```
Bash
10.0.0.1:8443: Running
10.0.0.2:8443: Running
```

# Step 7: Confirm that Loading is Operating Correctly

With your pipeline in place and running, data will immediately begin loading from the S3 file groups that you defined. If there were many files per file group, the LAT would first sort the files, then partition them for the fastest loading based on the sorting criteria you provided.

## Observing Loading Progress

With the pipeline running, data immediately begins to load into Ocient. To observe this progress, you can use the `pipeline status` command from the LAT Client or monitor the LAT metrics endpoint of the Loader Nodes.

You can check the status with this command by using the `--list-files` flag to include a summary of the files included in the load.

```
Shell
lat_client pipeline status --list-files
```

**Example responses:**

```
10.0.0.1:8443: Running
10.0.0.2:8443: Running

Pipeline Files Processed: 0
Pipeline Error Count: 0
Pipeline Files Remaining: 2

orders
  Files Processed: 0
  Error Count: 0
  Files Remaining: 1

products
  Files Processed: 0
  Error Count: 0
  Files Remaining: 1

orders

Status         Filename
processing     metabase_samples/csv/orders.csv

In Process Files:
processing     metabase_samples/csv/orders.csv

products

Status         Filename
processing     metabase_samples/csv/products.csv

In Process Files:
processing     metabase_samples/csv/products.csv
```

You can monitor the LAT metrics endpoint manually at the command line. Or, you can use a tool like Grafana® to retrieve metrics. For this example, run the curl command against the endpoint and review the result. For details on metrics, see the **LAT Metrics** Documentation.

**Command:**

CURL

```
curl https://127.0.0.1:8443/v2/metrics/lat:type=pipeline
```

If your LAT is running without TLS configured, replace the port number of your LAT Hosts with 8080 and the protocol with `http://`.

**Example response:**

JSON

```
{
  "request": {
  "mbean": "lat:type=pipeline",
  "type": "read"
  },
  "value": {
  "partitions": [
    {
        "offsets_durable": 1,
        "pushes_errors": 0,
        "pushes_attempts": 1,

```

© 2026 Ocient, Inc

```
    "records_buffered": 0,
    "records_errors_column": 0,
    "records_errors_deserialization": 0,
    "source_bytes_buffered": 0,
    "records_errors_transformation": 0,
    "offsets_processed": 199,
    "partition": "table_products-0",
    "records_filter_accepted": 1,
    "records_errors_row": 0,
    "records_filter_rejected": 0,
    "records_errors_generic": 0,
    "producer_send_attempts": 0,
    "offsets_pushed": 199,
    "pushes_unacknowledged": 0,
    "invalid_state": 0,
    "bytes_pushed": 145,
    "records_errors_total": 0,
    "offsets_buffered": 199,
    "complete": 0,
    "offsets_end": 1,
    "producer_send_errors": 0
    }
  ],
  "paused": 1,
  "bytes_buffered": 0,
  "workers": 20
  },
  "timestamp": 1626970368,
  "status": 200,
}
```

## Check Row Counts in Tables

To confirm that you are seeing results in the target tables, you can also run some simple queries to check row counts. Depending on the streamloader role settings, the time for records to become queryable can vary from a few seconds to minutes:

**Example Queries:**

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

SQL

```
Ocient> SELECT count(*) FROM public.orders;
COUNT(*)
--------------------
18760
```

SQL

```
Ocient> SELECT count() FROM public.products;
COUNT()
--------------------
200
```

Now you can explore the data in these four tables with any Ocient SQL queries.

## Check Errors

In this example, all rows load successfully. However, a successful load does not always happen, and you can inspect errors using the LAT Client. Whenever the LAT process fails to parse a file correctly or fails to transform or load a record, the LAT process records an error. The LAT Client includes the `lat_client pipeline errors` command that reports the latest errors on the pipeline.

A full error log is available on the Loader Nodes. These logs report all bad records and the reason that the load fails.

> When you load a pipeline from Kafka, the load might route errors to an error topic on the Kafka broker instead of the logs. The LAT Client does not contain the errors sent to the error topic. You can inspect these errors with Kafka utilities instead.

This LAT Client command displays a maximum of 100 error messages.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

```
lat_client pipeline errors --max-errors 100 --only-error-messages

|-------------------------------------------------|
| exception_message                               |
|-------------------------------------------------|
| Column name: time1. Message: Failed to evaluate  |
| expression. Cause:                              |
| java.time.format.DateTimeParseException         |
|-------------------------------------------------|
| Column name: time1. Message: Failed to evaluate  |
| expression. Cause:                              |
| java.time.format.DateTimeParseException         |
|-------------------------------------------------|
```

The errors indicate that there is an issue parsing the `time1` column. Options exist on the `pipeline errors` command to return JSON and to restrict the response to specific components of the error detail that includes a reference to the source location of this record.

The following command returns JSON that is delimited with newline characters. You can pass the JSON output to `jq` or a file. The JSON includes the source topic or file group, the filename where the error occurred, the offset that indicates the line number or Kafka offset, and the exception message that aids in troubleshooting and identifying the incorrect record in the source data. You can use the `log_original_message` pipeline setting to provide direct access to the parsed source record for errors when appropriate.

```
lat_client pipeline errors --max-errors 100 --json

{"time": "2022-05-17T16:53:50.387386+00:00", "topic": "calcs", "partition": 0, "s
{"time": "2022-05-17T16:53:50.404684+00:00", "topic": "calcs", "partition": 0, "s
```

# LAT Load JSON Data from S3

(deprecated) Integrate JSON data from Amazon S3 into Ocient for advanced analytics, designed for high-throughput and efficient processing of large data sets.

⚠ Data Pipelines are now the preferred method for loading data into the Ocient® System. For details, see **Load Data**. The LAT loading functionality will be removed in version 29.0.

A common setup for batch loading files into Ocient is to load from a bucket on Amazon® Web Services℠ (AWS℠) S3 with time partitioned data. In many instances, a batch load is performed on a recurring basis to load new files. The LAT transforms each document into rows in one or more different tables. Ocient's Loading and Transformation capabilities use a simple SQL-like syntax for transforming data. This tutorial will guide users through a simple example load using a small set of data in JSONL (newline delimited JSON) format. The data in this example is created from a test set for the Metabase℠ Business Intelligence tool.

## Prerequisites

This tutorial assumes that:

1. The Ocient System has network access to S3 from the Loader Nodes.
2. An Ocient System is installed and configured with an active storage cluster (See the **Ocient Application Configuration** guide).
3. Loading and Transformation is installed on the Loader Nodes.
4. A default "sink" for the Ocient Loader Nodes is configured on the system.
5. The **LAT Client Command Line Interface** is installed.

## Step 1: Create a New Database

To begin, you are going to load two example tables in a database. First, connect to a SQL Node using the **Commands Supported by the Ocient JDBC CLI Program**. Then

run the following DDL command:

```sql
CREATE DATABASE metabase;
```

## Step 2: Create Tables

To create tables in the new database, first connect to that database (e.g., `connect to jdbc:ocient://sql-node:4050/metabase`), then run the following DDL commands:

```sql
CREATE TABLE public.orders (
  created_at TIMESTAMP TIME KEY BUCKET(1, DAY) NOT NULL,
  id INT NOT NULL,
  user_id INT NOT NULL,
  product_id INT NOT NULL,
  subtotal DOUBLE,
  tax DOUBLE,
  total DOUBLE,
  discount DOUBLE,
  quantity INT,
  CLUSTERING INDEX idx01 (user_id, product_id)
);

CREATE TABLE public.products(
  created_at TIMESTAMP TIME KEY BUCKET(1, DAY) NOT NULL,
  id INT NOT NULL,
  ean VARCHAR(255),
  title VARCHAR(255),
  category VARCHAR(255) COMPRESSION GDC(2) NOT NULL,
  vendor VARCHAR(255),
  price DOUBLE,
  rating DOUBLE,
  CLUSTERING INDEX idx01 (category)
);
```

Now, the database tables are created and you can begin loading data.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

## Step 3: Create a Data Pipeline

Data pipelines are created using a simple loading configuration that is submitted to the Transformation Nodes to start loading. File Groups designate a batch of files to load. Each File Group is routed to one or more Ocient tables, and each column is the result of a transformation applied to the source document.

First, let's inspect the data you plan to load. Each document has a format similar to the following example:

JSON

```
/* orders */
{"id": 1, "user_id": 1, "product_id": 14, "subtotal": 37.65, "tax": 2.07, "total"
{"id": 2, "user_id": 1, "product_id": 123, "subtotal": 110.93, "tax": 6.1, "total
...

/* products */
{"id": 1, "ean": "1018947080336", "title": "Rustic Paper Wallet", "category": "Gi
{"id": 2, "ean": "7663515285824", "title": "Small Marble Shoes", "category": "Doo
{"id": 3, "ean": "4966277046676", "title": "Synergistic Granite Chair", "category
...
```

As you can see, this is similar to your target schema, but will require some transformation. Most transformations are identical to functions already in Ocient's SQL dialect. To route data to your tables, you need to create a pipeline.json file that has the following structure:

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

JSON

```
{
    "version": 2,
    "workers": 4,
    "source": {
        "type": "s3",
        "endpoint": "https://s3.us-east-1.amazonaws.com",
        "bucket": "ocient-docs",
        "compression": "none",
        "file_groups": {
            "orders": {
                "prefix": "metabase_samples/jsonl",
                "file_matcher_syntax": "glob",
                "file_matcher_pattern": "**orders*.jsonl",
                "sort_type": "lexicographic"
            },
            "products": {
                "prefix": "metabase_samples/jsonl",
                "file_matcher_syntax": "glob",
                "file_matcher_pattern": "**products*.jsonl",
                "sort_type": "lexicographic"
            }
        }
    },
    "transform": {
        "file_groups": {
            "orders": {
                "tables": {
                    "metabase.public.orders": {
                        "columns": {
                            "id": "id",
                            "user_id": "user_id",
                            "product_id": "product_id",
                            "subtotal": "subtotal",
                            "tax": "tax",
                            "total": "total",
                            "discount": "discount",
                            "created_at": "to_timestamp(created_at, 'yyyy-MM-dd\'
                            "quantity": "quantity"
                        }
                    }
                }
```

```
            },
            "products": {
                "tables": {
                    "metabase.public.products": {
                        "columns": {
                            "id": "id",
                            "ean": "ean",
                            "title": "title",
                            "category": "category",
                            "vendor": "vendor",
                            "price": "price",
                            "rating": "rating",
                            "created_at": "to_timestamp(created_at, 'yyyy-MM-dd\'
                        }
                    }
                }
            }
        }
    }
```

The most interesting part of this pipeline.json file is the way it defines the file groups. Note that each sets the S3 endpoint, a bucket, a prefix used for filtering the considered files, and then a file matcher. In this case you only have a single file, but if there were many files matching the pattern `**orders*.jsonl` then they would all be part of the file group.

The final parameter that you supplied is the sort type for the file load. This informs the LAT how you would like data to be ordered when loading. The ideal sort is in time order according to the defined TimeKey®. This makes more efficient segments and is much faster to load. In this case, you used the lexicographic sort which orders according to the characters in the filename. Other sort types are available to use file modified time or to extract the timestamp for sorting from the file path or filename.

## Step 4: Using the Loading and Transformation CLI

With a pipeline.json file ready to go, you can test this pipeline. To test, use the LAT CLI. For these examples, assume that two LATs are configured and set using an environment variable.

First configure the LAT CLI to use the hosts of the Ocient Loading and Transformation service. You can add these to every CLI command as a flag, but for simplicity you can also set them as environment variables. From a command line, run the following command replacing the IP addresses with the IP addresses of your LAT processes:

Shell

```
export LAT_HOSTS="https://10.0.0.1:8443,https://10.0.0.2:8443"
```

If your LAT is running without TLS configured, replace the port number of your LAT Hosts with 8080 and the protocol with `http://`.

Next, check on the status of the LAT:

Shell

```
lat_client pipeline status
```

**Example response:**

Bash

```
10.0.0.1:8443: Stopped
10.0.0.2:8443: Stopped
```

This confirms that you can reach the LAT from your CLI. If the status is “Running” it means a pipeline is already executing a pipeline. Next, you are going to update and start your new pipeline.

This example uses secure connections. If you receive an SSL Error when testing, your service might not be configured to use TLS or you might need to use the `--no-verify` flag if the certificate validation fails.

## Step 5: Test the Transformation

The CLI supports previewing a transformation with an example document and the pipeline file. This makes it easy to test your transformations.

First, save an example document to your file system to use for this test. For this demo, you can download an example file from **https://ocient-docs.s3.amazonaws.com/metabase_samples/jsonl/orders.jsonl** and save it to `~/orders.jsonl`.

Next, make sure the pipeline.json file that you created is stored at `~/pipeline.json`.

Now that both files are available, you can run the CLI to preview the results. Pass the preview command the topic name, the pipeline file, and the sample record file. The response contains the transformed data tied to the destination table and a list of any error records.

Similar to how you can preview records on a Apache® Kafka® topic for file loads, you can supply any one of the topics you created as file groups to preview the transformations.

Shell

```
lat_client preview --topic orders --pipeline ~/pipeline.json --records ~/orders.j
```

**Example response:**

JSON

```
{
    "tableRecords": {
        "metabase.public.orders": [
            {
                "id": 1,
                "user_id": 1,
                "product_id": 14,
                "subtotal": 37.65,
                "tax": 2.07,
                "total": 39.72,
                "discount": null,
                "created_at": 1549921227892000000,
                "quantity": 2
            },
            {
                "id": 2,
                "user_id": 1,
                "product_id": 123,
                "subtotal": 110.93,
                "tax": 6.1,
                "total": 117.03,
                "discount": null,
                "created_at": 1526371444580000000,
                "quantity": 3
            },
            {
                "id": 3,
                "user_id": 1,
                "product_id": 105,
                "subtotal": 52.72,
                "tax": 2.9,
                "total": 49.2,
                "discount": 6.42,
                "created_at": 1575670968544000000,
                "quantity": 2
            }
        ]
    },
    "recordErrors": []
}
```

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

You can see that the data is transformed and the columns to which each transformed value will be mapped. If there are issues in the values, these will appear in the `recordErrors` object. You can quickly update your pipeline.json file and preview again. Now, you can inspect different documents to confirm that various states of data cleanliness like missing columns, null values, and special characters are well handled by your transformations.

## Step 6: Configure and Start the Data Pipeline

With a tested transformation, the next step is to setup and start the data pipeline.

First, you must configure the pipeline using the `pipeline create` command. This validates and creates the pipeline, but will not take effect until you start the pipeline:

Shell

```
lat_client pipeline create --pipeline ~/pipeline.json
```

**Example response:**

Bash

```
10.0.0.1:8443: Created
10.0.0.2:8443: Created
```

ⓘ In cases where there is an existing pipeline operating, it is necessary to stop the pipeline and remove the original pipeline before creating and starting the new pipeline.

Now that the pipeline has been created on all LAT Nodes, you can start the LAT by running the `pipeline start` commands:

Shell

```
lat_client pipeline start
```

Example responses:

```bash
10.0.0.1:8443: Running
10.0.0.2:8443: Running
```

# Step 7: Confirm that Loading is Operating Correctly

With your pipeline in place and running, data will immediately begin loading from the S3 file groups you defined. If there were many files per file group, the LAT would first sort the files, then partition them for the fastest loading based on the sorting criteria you provided.

## Observing Loading Progress

With the pipeline running, data immediately begins to load into Ocient. To observe this progress, you can use the `pipeline status` command from the LAT Client or monitor the LAT metrics endpoint of the Loader Nodes.

You can check the status with this command by using the `--list-files` flag to include a summary of the files included in the load.

```shell
lat_client pipeline status --list-files
```

**Example responses:**

Bash

```
10.0.0.1:8443: Running
10.0.0.2:8443: Running

Pipeline Files Processed: 0
Pipeline Error Count: 0
Pipeline Files Remaining: 2

orders
  Files Processed: 0
  Error Count: 0
  Files Remaining: 1

products
  Files Processed: 0
  Error Count: 0
  Files Remaining: 1

orders

Status         Filename
processing     metabase_samples/jsonl/orders.jsonl

In Process Files:
processing     metabase_samples/jsonl/orders.jsonl

products

Status         Filename
processing     metabase_samples/jsonl/products.jsonl

In Process Files:
processing     metabase_samples/jsonl/products.jsonl
```

**Command:**

CURL

```
curl https://127.0.0.1:8443/v2/metrics/lat:type=pipeline
```

If your LAT is running without TLS configured, replace the port number of your LAT Hosts with 8080 and the protocol with `http://`.

**Example response:**

JSON

```
{
  "request": {
  "mbean": "lat:type=pipeline",
  "type": "read"
  },
  "value": {
  "partitions": [
    {

    "pushes_unacknowledged": 0,
    "invalid_state": 0,
    "bytes_pushed": 145,
    "records_errors_total": 0,
    "offsets_buffered": 199,
    "complete": 0,
    "offsets_end": 1,
    "producer_send_errors": 0
    }
  ],
  "paused": 1,
  "bytes_buffered": 0,
  "workers": 20
  },
  "timestamp": 1626970368,
  "status": 200
}
```

## Check Row Counts in Tables

To confirm that you are seeing results in the target tables, you can also run some simple queries to check row counts. Depending on the streamloader role settings, the time for records to become queryable can vary from a few seconds to minutes:

**Example Queries:**

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

SQL

```
Ocient> SELECT count(*) FROM public.orders;
COUNT(*)
--------------------
18760
```

SQL

```
Ocient> SELECT count() FROM public.products;
COUNT()
--------------------
200
```

Now you can explore the data in these four tables with any Ocient SQL queries.

## Check Errors

In this example, all rows load successfully. However, a successful load does not always happen, and you can inspect errors using the LAT Client. Whenever the LAT process fails to parse a file correctly or fails to transform or load a record, the LAT process records an error. The LAT Client includes the `lat_client pipeline errors` command that reports the latest errors on the pipeline.

A full error log is available on the Loader Nodes. These logs report all bad records and the reason that the load fails.

> When you load a pipeline from Kafka, the load might route errors to an error topic on the Kafka broker instead of the logs. The LAT Client does not contain the errors sent to the error topic. You can inspect these errors with Kafka utilities instead.

This LAT Client command displays a maximum of 100 error messages.

```
lat_client pipeline errors --max-errors 100 --only-error-messages

|-------------------------------------------------|
| exception_message                               |
|-------------------------------------------------|
| Column name: time1. Message: Failed to evaluate  |
| expression. Cause:                              |
| java.time.format.DateTimeParseException         |
|-------------------------------------------------|
| Column name: time1. Message: Failed to evaluate  |
| expression. Cause:                              |
| java.time.format.DateTimeParseException         |
|-------------------------------------------------|
```

The errors indicate that there is an issue parsing the `time1` column. Options exist on the `pipeline errors` command to return JSON and to restrict the response to specific components of the error detail that includes a reference to the source location of this record.

The following command returns JSON that is delimited with newline characters. You can pass the JSON output to `jq` or a file. The JSON includes the source topic or file group, the filename where the error occurred, the offset that indicates the line number or Kafka offset, and the exception message that aids in troubleshooting and identifying the incorrect record in the source data. You can use the `log_original_message` pipeline setting to provide direct access to the parsed source record for errors when appropriate.

```
lat_client pipeline errors --max-errors 100 --json

{"time": "2022-05-17T16:53:50.387386+00:00", "topic": "calcs", "partition": 0, "s
{"time": "2022-05-17T16:53:50.404684+00:00", "topic": "calcs", "partition": 0, "s
```

# LAT Advanced Loading and Transformations

(deprecated) Enhance your data loading processes with advanced transformations in Ocient, tailored for complex data requirements and optimized performance.

> ⚠ Data Pipelines are now the preferred method for loading data into the Ocient® System. For details, see **Load Data**. The LAT loading functionality will be removed in version 29.0.

This guide presents examples of some more advanced transformation topics such as exploding data, loading multiple tables from a single topic, working with arrays, and accessing nested data.

## Loading Multiple Tables from a Topic

The **LAT Load JSON Data from Kafka** guide shows an example of loading each topic into its own table. However, each topic can route data to multiple tables and many Apache® Kafka® topics can stream load simultaneously to one or more tables in a single pipeline.

Here is an example `pipeline.json` file that will load data into two separate tables:

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

JSON

```
{
    "version": 2,
    "pipeline_id": "pipeline-metabase",
    "source": {
        "type": "kafka",
        "kafka": {
          "bootstrap.servers": "127.0.0.1:9092",
        }
    },
    "transform": {
        "topics": {
            "products": {
                "tables": {
                    "metabase.public.products": {
                        "columns": {
                            "id": "id",
                            "ean": "ean",
                            "title": "title",
                            "category": "category",
                            "vendor": "vendor",
                            "price": "price",
                            "rating": "rating",
                            "created_at": "to_timestamp(created_at, 'yyyy-MM-dd\\
                        }
                    },
                    "metabase.public.product_ratings": {
                        "columns": {
                            "created_at": "now()",
                            "product_id": "id",
                            "rating": "rating",
                        }
                    }
                }
            }
        }
    }
}
```

A few key points here.

1. You are loading data from a Kafka topic called `products`.
2. That topic is loading into a table called `database.schema.table`.
3. Most columns are simply mapped from the source JSON document into, however some are transformed from the original data.
    a. `created_at` is parsed from a string using the `to_timestamp` function
    b. `created_at` for `product_ratings` is set dynamically to the value of the `now()` function

## Loading Nested JSON Data

As you can see from the transformation, the syntax is similar to SQL, but the inner language used to traverse the JSON document and manipulate arrays can be unfamiliar. The approach used to select a property from the source JSON is to follow the tree with dot notation. For example:

Given a series of two documents like:

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

JSON

```
{
  "country" : "US",
  "states" : ["AR", "VA", "MD", "IL"],
  "languages" : [
    {
      "name" : "English",
      "locale" : "en-US",
      "dialects" : ["Northern American English", "Southeast Super-Regional Englis
    },
    {
      "name" : "Spanish",
      "locale" : "es-US",
      "dialects" : ["Mexican Spanish", "Caribbean Spanish", "Central American Spa
    }
  ],
  "capital" : {
    "city" : "Washington",
    "region" : "District of Columbia"
  },
  "founded_in" : 1776
}

{
  "country" : "CA",
  "provinces" : ["BC", "ON", "QC", "MB"],
  "languages" : [
    {
      "name" : "English",
      "locale" : "en-CA"
    },
    {
      "name" : "French",
      "locale" : "fr-CA"
    }
  ],
  "capital" : {
    "city" : "Ottawa",
    "region" : "Ontario"
  },
```

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

```
  "founded_in" : 1867
}
```

You can access a property like the country simply by referencing the property:

JSON

```
/* Ocient transformations are in this format */
{
  "column_name" : "transformation"
}

/* to apply the country property to the country_code column */
{
  "country_code" : "country"
}
```

You can access nested properties easily as well:

JSON

```
/* sets the column capital_city to values like "Ottawa" */
{
  "capital_city" : "capital.city"
}
```

If you want to join the capital sub-properties together, you can easily do so:

JSON

```
/* sets the column capital_city to values like "Ottawa, Ontario" */
{
  "capital_city" : "concat(capital.city, ',', capital.region)"
}
```

Note that these two documents are not fully cleansed, and you want to capture the states or provinces array and assign it to a common destination column, regions. You can do this with a coalesce operator `||`:

JSON

```
/* sets the column regions to ["AR", "VA", "MD", "IL"] for the US and ["BC", "ON'
{
  "regions" : "states || provinces"
}
```

## Loading Array Data

Where arrays are encountered, special array notation is used. The benefit of this syntax is that properties in objects in arrays can also be accessed to return an array.

Another useful capability is the flattening of arrays. In the event that the values returned from a transformation includes nested arrays, you can flatten it to a single dimension array by appending `[]` to the end of the transformation expression. For example:

JSON

```
/* For the US, this transformation would return a structure like: [ ["", ""], ["'
{
  "regions" : "languages.dialects"
}

/* You can flatten this to return this one-dimensional array with structure like:
{
  "regions" : "languages.dialects[]"
}
```

## Exploding Array Data

In some cases, a single record from a loading source should represent more than one row in the target table. This is referred to as exploding the data. This allows nested array data to be expanded and to be associated with the corresponding values from the record.

For example, if you would like to “explode” the data in the languages array into a single row per value to populate a standalone “country_languages” table, you could do

the following for the `transform` section of your `pipeline.json` file:

JSON

```
{
  "transform": {
    "tables": {
      "my_database.my_schema.country_languages": {
        "columns": {
          "country_name": "country",
          "language_name": "EXPLODE(languages[].name)",
          "dialects": "EXPLODE(languages[].dialects)",
          "locale": "EXPLODE(languages[].locale)"
        }
      }
    }
  }
}
```

This would result in the following output. Note that instead of the original two records, this result will produce four rows into the new database table. The “exploded” values are unique, but the records inherit their parent values like `country` from the record when the explode occurs:

**Example Rows:**

JSON

```
{
  "country" : "US",
  "language_name" : "English",
  "dialects" : ["Northern American English", "Southeast Super-Regional English",
  "locale": "en-US"
}
{
  "country" : "US",
  "language_name" : "Spanish",
  "dialects" : ["Mexican Spanish", "Caribbean Spanish", "Central American Spanish
  "locale": "es-US"
}
{
  "country" : "CA",
  "language_name" : "English",
  "dialects" : NULL,
  "locale" : "en-CA"
}
{
  "country" : "CA",
  "language_name" : "French",
  "dialects" : NULL,
  "locale" : "fr-CA"
}
```

If multiple columns in the transformation include an `EXPLODE`, they results will be "zipped" together. If the arrays are different lengths, the number of rows will match the longest array. The shorter array will populate the end of its rows with NULL. This is sometimes referred to as an "Outer Explode."

## Transforming and Joining String Data

One common requirement is to split a string on a token to make an array. This is accomplished using transformation functions in the LAT.

Assuming a data input with a space separated string:

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

JSON

```
{ "states": "AL AK AZ AR CA CO CT DE" }
```

You can extract an array of state values in a few ways using the `tokenize` function. Tokenize has a number of flags to control how the pattern should be interpreted. For example `'q'` indicates the pattern is a literal and `'i'` indicates case insensitive regular expression.

JSON

```
/* You can use a literal space to split and load ["AL", "AK", "AZ", "AR", "CA", '
{
  "states_col" : "tokenize(states, ' ', 'q')"
}

/* You can use a regular expression for whitespace to split and load ["AL", "AK",
{
  "states_col" : "tokenize(states, '\\s', '')"
}
```

For more complex situations, you can split on any regular expression such as cases where values are wrapped with double quotes and might contain spaces. For this, you can use the expression `(?=(([^\\'\"]*[\\'\"]){2})*[^\\'\"]*$)` that leverages a zero-width positive lookahead assertion. Note that because this regex will be presented in a JSON document, certain characters must be escaped within the JSON string. For example, in JSON:

JSON

```
{
  "my_column" : "tokenize(states, ' (?=(([^\\'\"]*[\\'\"]){2})*[^\\'\"]*$)', '')'
}
```

This would actually pass the following regular expression to the tokenize function when the backslash escape sequences are processed:

Text

```
(?=(([^'"]*['"]){2})*[^'"]*$)
```

Similarly, note that double backslashes are required to provide escape characters in the regular expression. For example, `'\\s'` would actually pass the regular expression `\s` to the tokenize function.

Similar to splitting on a token, the LAT can easily join an array into a string with the `join` function. With source data that includes an array like the following:

JSON

```
{ "state_names": ["Alabama", "Alaska", "Arizona", "Arkansas", "California"] }
```

You can use the join function to produce this string:

JSON

```
/* join takes a string delimiter and will produce "Alabama, Alaska, Arizona, Arka
{
    "state_names_col": "join(', ', state_names)"
}
```

# LAT Overview

(deprecated) Overview of the Ocient Loading and Transformation (LAT) system for building pipelines that ingest, transform, and load data into the data warehouse.

> ⚠ Data Pipelines are now the preferred method for loading data into the Ocient® System. For details, see **Load Data**. The LAT loading functionality will be removed in version 29.0.

The Ocient Loading and Transformation (LAT) is a service used for transforming and streaming data into Ocient. The LAT transforms records from a configured Source using the **JMESPath** transformation language and streams records into Ocient tables.

## LAT Benefits

- Exactly-once processing from a Source
- Selecting data and arrays from nested JSON data
- Transforming records and routing into one or more tables
- Scalar data transformation (e.g., concatenate strings, uppercasing, rounding)
- Dynamic schema change handling

## LAT Data Flow

The LAT consumes JSON records, transforms them, and loads them into one or more Ocient tables. This process is referred to as a “pipeline”, with a single pipeline running per LAT instance. The pipeline is described by a JSON-based configuration that instructs the LAT how to consume records from a Source, how to transform the records, and which Ocient table to route the records to. As records are consumed, the transformations described in the configuration are applied to each record before forwarding the resulting records to Ocient.

Each pipeline configuration can map a record to one or more Ocient Tables, each table with its own transformation configuration. LAT can optionally be configured to write

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

records which were unable to be processed to an Apache® Kafka® error topic.

Multiple LAT instances can be used in tandem to further parallelize a pipeline. The LAT makes use of the Kafka Consumer library to ensure that each Kafka Partition is only assigned to a single instance. To use multiple instances, configure each LAT instance with the same pipeline configuration. The LAT instances will automatically coordinate and distribute the load across the instances.

The LAT is controlled by an HTTP endpoint and a command line interface (CLI) is supplied to perform common actions such as starting, stopping, or updating the LAT pipelines.

# LAT Data Types in Loading

(deprecated) Reference for source and target data types supported by the Ocient Loading and Transformation (LAT) system, including conversions and edge case handling.

> ⚠ Data Pipelines are now the preferred method for loading data into the Ocient® System. For details, see **Load Data**. The LAT loading functionality will be removed in version 29.0.

After extracting from source files or topics, data can be transformed and mapped to target columns in Ocient tables.

LAT automatically binds many primitive source data types to Ocient column data types and automatically converts some source types to the target column type. Different source data types automatically bind to target columns using different conventions.

For example, a string in JSON such as `'123'` that loads into an `INT` column properly binds to the corresponding integer value `123`. Similarly, an integer like `456` can automatically bind to an `INT` column as `456`, a `FLOAT` column as `456.0`, and a `VARCHAR` column as `'456'`. Finally, a string including Well-Known Text (WKT) representation of a `POINT` automatically binds into an `ST_POINT` column.

## Empty String Handling

When you attempt to load an empty string into a target column with LAT, most data types raise an error and the record does not load into the target table. The exceptions are `varchar`, `decimal`, `binary`, and `array` column types. In those cases, the data warehouse loads these values:

- `varchar`: An empty string
- `decimal`: 0.0 (with the appropriate precision)
- `binary`: An empty binary blob
- `array`: An empty array

> ⓘ When you extract data from text-based formats like delimited data, the data warehouse loads empty data as an empty string unless you use the `empty_as_null` setting.

© 2026 Ocient, Inc

## NULL Handling

If you do not provide a value for a column in the target table, this table explains what value the data warehouse stores in the column. For the purposes of default value handling, these are equivalent:

- Pipeline is missing a column.
- Pipeline includes a column but the value in the JSON or the source data evaluates to `null`.
- Pipeline includes a column but the field is missing on the source record (e.g., `a.b` does not exist in a JSON record).

To transform a NULL or missing value into a default in the pipeline, use the transformation functions. For example: `not_null(a.b, 'my_default')`

| Ocient Column Definition | Database Behavior When Column is Missing or Column Value Evaluates to NULL |
|---|---|
| NOT NULL with default | Default |
| NOT NULL with no default | Record fails |
| Nullable with default | Default |
| Nullable with no default | NULL |

## Data Type Binding

Refer to the **Data Types** for detailed information about each data type. These tables describe the automatic binding conventions of each data type.

`BIGINT`

| Valid JSON Bind Types: | Number, String |
|---|---|
| **Note:** | Number and String can be either integer or floating point values and are converted to 64-bit signed integers. Decimals are dropped. '+','-' can be used at the beginning of a string to indicate sign. String overflows result in errors, while numeric overflows are silent. |
| **Example:** | {<br>"number_bigint": 1.0,<br>"string_bigint": "1" |

| | |
|---|---|
| **Valid JSON Bind Types:** | **Number, String** |
| | } <br> -> 1, 1 |

`BINARY`

| | |
|---|---|
| **Valid JSON Bind Types:** | **String** |
| **Note:** | Converted as UTF-8 to binary: each character in the string taking its binary representation. |
| **Example:** | { <br> “string_binary”: “hello” <br> } <br> -> BINARY(01101000 01100101 01101100 01101100 01101111) |

`BOOLEAN`

| | |
|---|---|
| **Valid JSON Bind Types:** | **Boolean, String** |
| **Note:** | For a value of true, a string must be one of (case insensitive): true, t, yes, on, y, 1. <br> For a value of false, a string must be one of (case insensitive): false, f, no, off, n, 0. |
| **Example:** | { <br> “boolean”: true, <br> “string_0”: “yes”, <br> “string_1”: “FALSE” <br> } <br> -> true, true, false |

`DATE`

| | |
|---|---|
| **Valid JSON Bind Types:** | **String, Number** |
| **Note:** | If String, must be in format “YYYY-MM-DD”. If Number must be an EPOCH_DAY. Use the built-in TO_DATE function to convert a string with a different date format to an EPOCH_DAY and bind. |

| | |
|---|---|
| **Valid JSON Bind Types:** | **String, Number** |
| **Example:** | {<br>“string_date”: “2021-11-04”,<br>“epoch_date”: 0<br>}<br>-> DATE(2021-11-04), DATE(1970-01-01) |

`DECIMAL`

| | |
|---|---|
| **Valid JSON Bind Types:** | **Number, String** |
| **Valid Logical Types:** | Decimal |
| **Note:** | Number and String can be either integer or floating point values. Precision and scale for the loaded data are defined by the database table definition. The target column must support enough digits both before and after the decimal point to accommodate decimal values extracted from Fixed Width Binary or other record formats that support decimal data. If insufficient precision or scale exists in the target column, the data will fail to load. |
| **Example:** | {<br>“number_decimal”: 1.0,<br>“string_decimal”: “1.1”<br>}<br>-> DECIMAL(1.0), DECIMAL(1.1) |

`DOUBLE` , `DOUBLE PRECISION`

| | |
|---|---|
| **Valid JSON Bind Types:** | **Number, String** |
| **Note:** | Number and String can be either integer or floating point values. |
| **Example:** | {<br>“number_double”: 1.0,<br>“string_double”: “1”<br>}<br>-> 1.0, 1.0 |

`HASH`

| Valid JSON Bind Types: | String |
|---|---|
| **Note:** | Converted as hexadecimal to binary: each character in the string must be a valid hexadecimal digit /[0-9a-f]+/i. |
| **Example:** | {<br>“hex_string”: “0a1b”<br>}<br>-> HASH(0000 1010 0001 1011) |

`INT`

| Valid JSON Bind Types: | Number, String |
|---|---|
| **Note:** | Number and String can be either integer or floating point values and are converted to 32-bit signed integers. Decimals are dropped. ’+’,’-’ can be used at the beginning of a string to indicate sign. String overflows result in errors, while numeric overflows are silent. |
| **Example:** | {<br>“number_int”: 1.0,<br>“string_int”: “1”<br>}<br>-> 1, 1 |

`IPV4`

| Valid JSON Bind Types: | String |
|---|---|
| **Note:** | Source data must be in the form: [0-255].[0-255].[0-255].[0-255] |
| **Example:** | {<br>“string_ipv4”: “192.168.0.1”<br>}<br>-> IPV4(192.168.0.1) |

`IP`

| Valid JSON Bind Types: | String |
|---|---|
| **Note:** | Source string can be in IPV4 or IPV6 format. IPV6 can appear in full form as show in this example or in condensed form. Condensed form can use :: notation |

| Valid JSON Bind Types: | String |
| --- | --- |
| | (e.g., 2001:cdba::3257:9652) and leading zeros in IPV6 hextets can also be omitt<br>(e.g., 2001:0db8:0000:0000:0000:0000:3257:9652 → 2001:db8:0:0:0:0:3257:965<br>IPV6 can also appear as a string of 32 hex characters without colons<br>(e.g., 2001cdba00000000000000032579652). |
| **Example:** | {<br>“string_ip_ipv4”: “192.168.0.1”,<br>“string_ip_ipv6”: “2001:cdba:0000:0000:0000:0000:3257:9652”<br>}<br>-> IP(192.168.0.1), IP(2001:cdba:0000:0000:0000:0000:3257:9652) |

`LINESTRING`, `ST_LINESTRING`

| Valid JSON Bind Types: | String |
| --- | --- |
| **Note:** | Must be in the WKT format “LINESTRING(LONG LAT, ... )” or “LINESTRING EMPTY” |
| **Example:** | {<br>“string_st_linestring”: “LINESTRING(-71.064544 42.28787, -90.444444 89.562993)”<br>}<br>-> ST_LINESTRING(-71.064544 42.28787, -90.444444 89.562993) |

`MATRIX`

| Valid JSON Bind Types: | Array[Array], String |
| --- | --- |
| **Note:** | Arrays must be two-dimensional with the same rows and columns as specified in the table. String must be in JSON two-dimensional array format. Each element will be cast according to the element type’s rules in this section. |
| **Example:** | {<br>“int_matrix”: [[0, 1, 2],[3, 4, 5],[6, 7, 8]],<br>“string_matrix”: “[[0,1],[2,3]]”<br>}<br>-> MATRIX[[0,1,2],[3,4,5],[6,7,8]], MATRIX[[0,1],[2,3]] |

`POINT`, `ST_POINT`

| | |
|---|---|
| **Valid JSON Bind Types:** | **String** |
| **Note:** | Must be in the format “POINT(LONG LAT)“ |
| **Example:** | {<br>“string_st_point”: “POINT(-71.064544 42.28787)”<br>}<br>-> ST_POINT(-71.064544, 42.28787) |

`POLYGON`, `ST_POLYGON`

Ensure that polygons are oriented in your intended way when you load them as polygon orientation matters in Ocient semantics. If you intend all polygons to be oriented counter-clockwise, use the **st_forcepolygonccw** transform function to enforce counter-clockwise semantics.

| | |
|---|---|
| **Valid JSON Bind Types:** | **String** |
| **Note:** | Must be in the WKT format “POLYGON((LONG LAT, ... ))” or “POLYGON((LONG LAT, ... ), (LONG LAT, ... ))” or “POLYGON EMPTY” |
| **Example:** | {<br>“string_st_polygon”: “POLYGON((-87.62 41.87, -89.40 43.07, -87.906 43.04, -87.62 41.87))”<br>}<br>-> ST_POLYGON((-87.62 41.87, -89.40 43.07, -87.906 43.04, -87.62 41.87)) |

`REAL`, `FLOAT`, `SINGLE PRECISION`

| | |
|---|---|
| **Valid JSON Bind Types:** | **Number, String** |
| **Note:** | Number and String can be either integer or floating point values. Precision and scale are inherited from the table definition. |
| **Example:** | {<br>“number_float”: 1.0,<br>“string_float”: “1”<br>}<br>-> 1.0, 1.0 |

`SMALLINT`

| | |
|---|---|
| **Valid JSON Bind Types:** | **Number, String** |
| **Note:** | Number and String can be either integer or floating point values and are converted to 16-bit signed integers. Decimals are dropped. '+','-' can be used at the beginning of a string to indicate sign. String overflows result in errors, while numeric overflows are silent. |
| **Example:** | {<br>"number_smallint": 1.0,<br>"string_smallint": "1"<br>}<br>-> 1, 1 |

`TIME`

| | |
|---|---|
| **Valid JSON Bind Types:** | **Number, String** |
| **Note:** | String must be in the format: HH:MM:SS[.SSSSSSSSS]. Number must represent nanoseconds since midnight. Use the TO_TIME transformation function to convert an arbitrary string format to nanoseconds and bind. |
| **Example:** | {<br>"number_time": 1000000000,<br>"string_time": "07:33:10.0001"<br>}<br>-> TIME(00:00:01.0000), TIME(07:33:10.0001) |

`TIMESTAMP`

| | |
|---|---|
| **Valid JSON Bind Types:** | **Number, String** |
| **Note:** | String must be in the format: YYYY-MM-DD HH:MM:SS[.SSSSSSSSS]. Number must represent nanoseconds since epoch. Use the TO_TIMESTAMP transformation function to convert an arbitrary string format to nanoseconds and bind. |
| **Example:** | {<br>"number_timestamp": 1000000000,<br>"string_timestamp": "2021-11-04 07:33:10.0001"<br>}<br>-> TIMESTAMP(1970-01-01 00:00:01.0000), TIMESTAMP(2021-11-04 07:33:10.0001) |

`TINYINT`, `BYTE`

| | |
|---|---|
| **Valid JSON Bind Types:** | **Number, String** |
| **Note:** | Number and String can be either integer or floating point values and are converted to 8-bit signed integers. Decimals are dropped. '+','-' can be used at the beginning of a string to indicate sign. String overflows result in errors, while numeric overflows are silent. |
| **Example:** | {<br>"number_smallint": 1.0,<br>"string_smallint": "1"<br>}<br>-> 1, 1 |

`TUPLE`

| | |
|---|---|
| **Valid JSON Bind Types:** | **Array, String** |
| **Note:** | String must be in JSON array format "[e0,e1,e2]". Each element will be cast to the tuple element type at that element's index from the Ocient table according to the rules for that element type in this section. |
| **Example:** | {<br>"double_int": [1.0, 1],<br>"string_array": ["Ocient", [0, 1]],<br>"string_tuple": "[1.0, 1]",<br>"tuple_tuple": [[1.0, 1],["Ocient", 2]]<br>}<br>-> TUPLE(DOUBLE, INT)(1.0, 1), TUPLE(STRING, INT[])("Ocient", INT[0, 1]), TUPLE(DOUBLE, INT)(1.0, 1), TUPLE(TUPLE(DOUBLE, INT), TUPLE(VARCHAR, INT)((1.0, 1), ("Ocient", 1)) |

`TYPE[]`

| | |
|---|---|
| **Valid JSON Bind Types:** | **Array, String** |
| **Note:** | String must be in JSON array format "[e0,e1,e2]". Each element will be cast to the array element type from the Ocient table according to the rules for that element type in this section. |
| **Example:** | {<br>"int_array": [0,1,2],<br>"2d_array": [[0, 1, 2],[3, 4]], |

| | |
|---|---|
| **Valid JSON Bind Types:** | **Array, String** |
| | “string_array”: “[0,1,2]”,<br>“tuple_array”: [[0, 1.0, “Ocient”],[1, 2.0, “rocks”]]<br>}<br>-> INT[0,1,2], INT[][INT[0,1,2],INT[3,4]], INT[0,1,2] TUPLE(INT, FLOAT, VARCHAR)[(0, 1.0, “Ocient”), (1, 2.0. “rocks”)] |

`UUID`

| | |
|---|---|
| **Valid JSON Bind Types:** | **String** |
| **Note:** | Source data must be a valid hyphen-separated UUID. |
| **Example:** | {<br>“string_uuid”: “40e6215d-b5c6-4896-987c-f30f3678f608”<br>}<br>-> UUID(40e6215d-b5c6-4896-987c-f30f3678f608) |

`VARCHAR`, `CHAR`

| | |
|---|---|
| **Valid JSON Bind Types:** | **String, Number, Boolean** |
| **Note:** | Number and Boolean types are converted to their string representations. |
| **Example:** | {<br>“number_string”: 1000,<br>“boolean_string”: true,<br>“string_string”: “string”<br>}<br>-> “1000”, “true”, “string” |

# Load Geospatial Data

Geospatial data can be loaded from a variety of formats into Ocient. The Ocient System requires special considerations when you load geospatial data into Ocient including:

- Coordinate System
- Supported Geospatial Loading Formats
- Geospatial Type Conversion
- POINT Normalization

- POLYGON Normalization

### Coordinate System

Ocient uses Spatial Reference System ID (SRID) 4326 for all internal geospatial data types. SRID 4326 is defined in the **WGS84 Standard**. Before you load the source data, all data should have the SRID 4326 data type. The loading operation ignores any source data that contains the coordinate system SRID information.

## Supported Geospatial Loading Formats

### Well-Known Text

The primary data format for loading geospatial data in Ocient is the Well-Known Text (WKT) format. This string format is a portable format that can represent points, lines, and polygons.

String data in WKT format can automatically load into `POINT`, `LINESTRING`, and `POLYGON` Ocient column types. In addition, arrays of strings in WKT format can automatically load into array columns of a suitable geospatial data type. The Ocient System assumes raw strings are in WKT format when the system loads these strings into geospatial column types.

Each `LINESTRING` or `POLYGON` value can be up to a maximum of 512 MB in size. This means a `LINESTRING` or `POLYGON` can contain approximately 32 million point values.

- WKT strings are whitespace insensitive, so `POINT(10 20)` is equivalent to `POINT (10 20)`.
- WKT strings are case insensitive.
- Extended Well-Known Text (EWKT) is not supported. To load EWKT data, load the substring after the EWKT semicolon as the WKT format.

### Well-Known Binary and Extended Well-Known Binary

The other data formats that can load into Ocient are Well-Known Binary (WKB) and Extended Well-Known Binary (EWKB) formats. The Ocient System requires an explicit transformation function for both WKB and EWKB formats when you load data and convert it into the target column type.

You can use the function `st_geomfromewkb` to transform WKB and EWKB data.

In both cases, the Ocient System represents the WKB or EWKB string data as hexadecimal string data. The hexadecimal string can be one of these formats:

- Only hexadecimal digits: `000000000140000000000000004010000000000000`
- Prefixed with `0x` : `0x000000000140000000000000004010000000000000`
- Prefixed with `\x` : `\x000000000140000000000000004010000000000000`

## Geometry Conversion

Ocient provides the automatic conversion of geometries from simpler types to more complex types. The conversion allows the load of a LINESTRING column with a POINT, or a POLYGON column with a POINT or LINESTRING. This capability also allows the load of arrays of POLYGON data from the source arrays of a combination of POINT, LINESTRING, and POLYGON data, which represents a geometry collection.

## POINT Normalization

During loading, Ocient automatically performs normalization of POINT data into a regular format used within Ocient. The Ocient System performs the following operations on POINT data during the load:

- Constrain longitude to [-180, 180) and latitude to [-90, 90]; wrap around invalid coordinates using correct geographical handling.
- Snap points near the pole to the pole.
- Set longitude of points on the pole to 0
- Remove signed zeros from coordinates, so -0 becomes 0.

## POLYGON Normalization

Ocient follows a counterclockwise rotation convention to indicate the outer ring of a POLYGON. The inner ring follows a clockwise rotation. If the Ocient System loads a POLYGON with a clockwise outer ring, the system indicates that the POLYGON is outside of the given ring.

⚠ In some cases, the POLYGON load can lead to unexpected results when the source data follows a different polygon rotation convention.

To account for this, the LAT provides the `st_forcepolygonccw` function that forces a counterclockwise rotation of the outer polygon ring and a clockwise rotation of the inner polygon ring when applicable.

### Geospatial Transformation Functions

The LAT has a select set of transformation functions to construct geospatial types and manipulate them during the load. You can find the supported geospatial transformation functions in **LAT Transformation Functions**.

# LAT Pipeline Configuration

(deprecated) Configure an Ocient LAT pipeline by defining sources, transforms, and sinks in a configuration file to control end-to-end data loading behavior.

> ⚠ Data Pipelines are now the preferred method for loading data into the Ocient® System. For details, see **Load Data**. The LAT loading functionality will be removed in version 29.0.

A pipeline configuration is a JSON file that fully describes the necessary elements to run a pipeline, including

- **Source** - the source location from which a pipeline should read records to process
- **Extract** - how a pipeline should extract data from the source
- **Transform** - how a pipeline should transform incoming records
- **Sink** - the destination where a pipeline should write transformed rows

The JSON file is a list of keys with (possibly nested) values. The available key-value pairs are documented in these sections.

## Pipeline

Top level configuration for a pipeline.

Required keys:

- **version**
- **source**
- **extract**
- **transform**

The following is an example of the structure of a pipeline configuration.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

JSON

```
{
    "version": 2,
    "source": {
        "type": "kafka"
        // kafka source configuration
    },
    "sink": {
        "type": "ocient"
        // ocient sink configuration
    },
    "extract": {
        // extract configuration
    },
    "transform": {
        "topics": {
            "my-topic": {
                "tables": {
                    "my-table": {
                        "columns": {
                            "my-col1": "record_field_1",
                            "my-col2": "record_field_2"
                        }
                    }
                }
            }
        }
    }
}
```

# Configuration

`version`

The pipeline's version. Required value is `2`.

| | |
|---|---|
| **Type:** | `int` |
| Required: | Yes |
| Default: | |

## `pipeline_id`

A unique identifier for this pipeline. Allowed characters are `a-z`, `A-Z`, `0-9`, `_`, and `-`.

The `pipeline_id` is used to uniquely identify a pipeline. It is used for a few purposes:

Deduplication scope. See **Understanding Deduplication**.

1. For Apache® Kafka® loads, the consumer `group.id` is set to `ocient-lat-[pipeline_id]`.

> For most loads from File Sources, it is advisable to leave the `pipeline_id` unset when creating a pipeline using the LAT client. The client will assign the pipeline a random UUID.

| | |
|---|---|
| **Type:** | `string` |
| Required: | No |
| Default: | LAT client randomly generated UUID. |

## `workers`

The number of workers this pipeline should use for processing records.

| | |
|---|---|
| **Type:** | `int` |
| Required: | No |
| Default: | `DEFAULT_NUM_WORKERS` in service configuration |

## `log_original_records`

Add original records to the error log when errors occur. When this setting is set to `true`, LAT writes data extracted from the source to the error log and in some error messages. By default, this setting is `false` and source data is not written to the error log nor included in error messages.

In order to enable this setting, the **LAT_ALLOW_LOG_ORIGINAL_RECORDS** service configuration must also be enabled.

> This configuration only affects pipelines that do not use an **error_topic**.

### `seek_on_rebalance`

Whether to seek a newly assigned partition to the latest known durable record prior to resuming processing. Disabling this behavior should typically be reserved for test scenarios and is only supported for Kafka loading.

| **Type:** | `boolean` |
| --- | --- |
| Required: | No |
| Default: | `true` |

### `continue_on_unrecoverable_error`

Whether to allow workers to continue processing when they encounter an ordinarily unrecoverable error.

| **Type:** | `boolean` |
| --- | --- |
| Required: | No |
| Default: | `false` |

### `single_file_mode`

Enable the single file mode. This mode is designed for a specific use case where there are few files but each file size is large. When using this mode, only a single file is processed at a time, so **Common File Source Configuration** must be equal to `1` and only one **Common File Source Configuration** can be defined. The single file is processed in

parallel by the number of workers defined by the pipeline `workers` setting. There is no need to enable this in common use cases.

| **Type:** | `boolean` |
| --- | --- |
| Required: | No |
| Default: | `false` |

> ⚠ A known limitation exists with the LAT metrics when you use the single file mode. Metrics returned from the `lat_client pipeline status` command might not display the expected count of files processed, processing, and so on. However, the load still displays the correct `PROCESSING` and `COMPLETED` statuses.

### `error_topic`

A Kafka Topic to write records which cannot be processed. If absent, error records will be logged to the error log file without additional processing.

> ⓘ This configuration is only available if a Kafka Source is configured for the pipeline. The configuration for that source will apply to the Kafka Producer for this topic.

| **Type:** | `string` |
| --- | --- |
| Required: | No |
| Default: | `null` |

### `polling_duration`

Maximum duration to block while polling for new records from a Source, in milliseconds.

| **Type:** | `int` |
| --- | --- |
| Required: | No |
| Default: | `1000` |

### `source`

Source configuration section. See **LAT Source Configuration** for nested configuration.

| | |
|---|---|
| **Type:** | `object` |
| Required: | Yes |
| Default: | |

### `sink`

Sink configuration section. See **LAT Sink Configuration** for inline configuration details. `sink` cannot be set if `sink_name` is set. `sink` can be omitted if a default sink is defined as an **External Sink Configuration**.

| | |
|---|---|
| **Type:** | `object` |
| Required: | No |
| Default: | `null` |

### `sink_name`

The name of an externally configured sink. `sink_name` cannot be set if **sink** is set. See **External Sink Configuration**. `sink_name` can be omitted if a default sink is defined as an **External Sink Configuration**.

| | |
|---|---|
| **Type:** | `string` |
| Required: | No |
| Default: | `null` |

### `extract`

Extract configuration section. See **LAT Extract Configuration** for nested configuration.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| | |
|---|---|
| **Type:** | `object` |
| Required: | No |
| Default: | Defaults to JSON record type with default settings |

### `transform`

Transform configuration section. See **LAT Transform Configuration** for nested configuration.

| | |
|---|---|
| **Type:** | `object` |
| Required: | Yes |
| Default: | |

# LAT Source Configuration

(deprecated) Configure Ocient LAT pipeline sources for loading data from Kafka, S3, file systems, and other systems, including connection details and parser settings.

> ⚠ Data Pipelines are now the preferred method for loading data into the Ocient® System. For details, see **Load Data**. The LAT loading functionality will be removed in version 29.0.

## Source

A source configuration object.

Required keys:

- **source.type**

`source.type`

Type of source to use in the pipeline.

| | |
|---|---|
| **Type:** | **string** |
| **Required:** | Yes |
| **Default:** | |

Allowed values:

- `kafka` : see **Kafka Configuration** for additional configuration.
- `s3` : see **Load from a File Source** and **S3 Source Configuration** for additional configuration.
- `local` : see **Load from a File Source** for additional configuration.

## Load from a File Source

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

Currently, LAT supports loading files from an Amazon® Web Services℠ (AWS℠) S3 instance (like AWS S3 or IBM® Cloud® Object Storage) or from a local file system. Common configuration for all File Sources will be listed in **Common File Source Configuration**, followed by sections describing source-specific configurations.

File Sources are defined by creating "file groups" that represent a logical set of files to be loaded. Each file group is given a `file_group_name` that corresponds to the file group name in the transform section of the pipeline configuration. Each file group has settings to select the specific files that should be loaded.

The LAT supports loading from individual files with extensions such as `.jsonl` and `.csv`. GZIP compression is supported. However, files using the TAR archive format, LZOP compression, or ZIP compression are not supported.

> ⚠ If you load files with unsupported archive or compression formats, the load might stop or produce unexpected results.

The performance of loading into Ocient is greatly improved when records are presented in a well ordered time sequence. This sequence allows more efficient creation of segments and sorting of records into TimeKey® buckets. For this reason, the LAT has options to define how files in a file group should be sorted prior to loading.

## File Group Filtering and Sorting Example

If you want to load all the files under a certain directory, the file group configuration is basic:

JSON

```
"my_file_group": {
    "prefix": "/dir1",
    "file_matcher_syntax": "glob",
    "file_matcher_pattern": "**",
    "sort_type": "lexicographic"
}
```

This file group configuration will select all files under `/dir1` (including those under its subdirectories) and sort them lexicographically.

However, if a user needs to selectively choose, filter, and sort the files selected, this process provides flexible options for doing so.

For an individual file group in a file type load, there are multiple steps to select, rename, filter, and sort the files retrieved. The files selected occur through this sequence:

1. Prefix filtering
2. File matching
3. File renaming
4. Timestamp extract pattern matching (only `extract_timestamp`)
5. Range matching
6. Final list sorting

For example, given these files from a local file system:

Text

```
/dir1/file.json
/dir1/files1/year=2021/month=01/day=01/files2/10-00-00.csv
/dir1/files1/year=2021/month=01/day=01/file.json
/dir1/files1/year=2021/month=01/day=01/files3/11-00-00.json
/dir1/files1/year=2021/month=01/day=01/files2/12-00-00.json
/dir1/files1/year=2021/month=01/day=01/files2/14-00-00.json
/dir1/files1/year=2021/month=01/day=01/files2/13-00-00.json
```

And a `file_group` configuration:

JSON

```
"my_group": {
    "prefix": "/dir1/files1/",
    "file_matcher_syntax": "regex",
    "file_matcher_pattern": "/dir1/files1/year=(\\d{4})/month=(\\d{2})/day=(\\d{2})
    "rename_format": "{1}-{2}-{3}-{4}-{5}-{6}",
    "sort_type": "extract_timestamp",
    "path_timestamp_pattern": "yyyy-MM-dd-HH-mm-ss",
    "start_time": "2021-01-01T13:00:00",
    "stop_time": "2021-01-01T14:00:01"
}
```

© 2026 Ocient, Inc

**Step 1:** Prefix Filtering

Prefix filtering occurs first and includes only files that are in the matching prefix paths. The prefix is the path part following the bucket for S3 types, and it is the path to files in a local file type load.

JSON

```
"prefix": "/dir1/files1/"
```

Result: `/dir1/file.json` is filtered out because it is not in the `prefix`.

**Step 2:** File Matching

Next, file matching uses a pattern to match files that should be included. File matcher patterns apply to the full path of the file including any prefix defined in the prior step.

JSON

```
"file_matcher_syntax": "regex"
"file_matcher_pattern": "/dir1/files1/year=(\\d{4})/month=(\\d{2})/day=(\\d{2})/fil
```

Result: `/dir1/files1/year=2021/month=01/day=01/files2/10-00-00.csv` is filtered out because it does not end in `.json`. `/dir1/files1/year=2021/month=01/day=01/file.json` is filtered out because it is not in the subdirectory `files1`.

**Step 3:** File Renaming

File renaming is a step that can be useful in a case where the selected files have disparate file names that would make it difficult to extract timestamps from. Files are only renamed internally to the LAT to facilitate the file selection process; they are *not* actually renamed locally or on S3.

By unifying each filename into a consistent format, this step should make it easier to use the `extract_timestamp` sort type, or even to `lexicographically` sort on some parameter within the filename itself.

© 2026 Ocient, Inc

JSON

```
"file_matcher_pattern": "/dir1/files1/year=(\\d{4})/month=(\\d{2})/day=(\\d{2})/fil
"rename_format": "{1}-{2}-{3}-{4}-{5}-{6}",
```

Result: The files that match the `file_matcher_pattern` regular expression are renamed using the `rename_format`.

Current Files at this Step:

Text

```
/dir1/files1/year=2021/month=01/day=01/files3/11-00-00.json
/dir1/files1/year=2021/month=01/day=01/files2/12-00-00.json
/dir1/files1/year=2021/month=01/day=01/files2/14-00-00.json
/dir1/files1/year=2021/month=01/day=01/files2/13-00-00.json
```

Renamed file list that enters the next step:

Text

```
2021-01-01-11-00-00
2021-01-01-12-00-00
2021-01-01-14-00-00
2021-01-01-13-00-00
```

**Step 4:** Timestamp Extract Pattern Matching

A filter is applied when the sort_type is `extract_timestamp`. The `extract_timestamp` sort type extracts timestamps from the file's filepath. Either a `path_timestamp_pattern` or a `file_timestamp_pattern` must be set. If a filename does not match the set pattern, it will be filtered out.

JSON

```
"sort_type": "extract_timestamp"
"path_timestamp_pattern": "yyyy-MM-dd-HH-mm-ss",
```

© 2026 Ocient, Inc

Result: In this example, a `path_timestamp_pattern` is set, which is a `DateTimeFormatter` pattern that will extract a timestamp from the starting from the beginning of the filename, used for the next step. No files are filtered here because the rename step above was able to unify filename formats in a way that the `path_timestamp_pattern` could match on all the files.

Internal to the LAT, the files are associated with their datetimes, which will be used in the next step:

Text

```
filename -> datetime extracted in ISO 8601 format
2021-01-01-11-00-00 -> 2021-01-01T11:00:00Z
2021-01-01-12-00-00 -> 2021-01-01T12:00:00Z
2021-01-01-14-00-00 -> 2021-01-01T14:00:00Z
2021-01-01-13-00-00 -> 2021-01-01T13:00:00Z
```

There are potential pitfalls with using the `extract_timestamp` `sort_type`, described in the Potential Pitfalls section below.

**Step 5:** Range Matching

Range matching occurs next based on the chosen `sort_type` algorithm.

- For `extract_timestamp` or `metadata`, a timestamp is associated with each file for sorting. A start and end time can be optionally provided to limit files to select.
- For `lexicographic`, the filename itself is used for sorting. A start and end filename can be provided to limit the files that are selected.

Text

```
"sort_type": "extract_timestamp"
"path_timestamp_pattern": "yyyy-MM-dd-HH-mm-ss",
"start_time": "2021-01-01T13:00:00"
"stop_time": "2021-01-01T14:00:01"t
```

Result: The file `2021-01-01-12-00-00` is filtered out because it is not in the start and end time ranges.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

**Step 6:** Final List Sorting

Finally, the fully filtered file list contains two files from your original list. These are then sorted according to the `sort_type` algorithm and partitioned across the workers for loading.

Remaining files before sorting:

```
Text

2021-01-01-14-00-00
2021-01-01-13-00-00
```

Final list - sorted, renamed files:

```
Text

2021-01-01-13-00-00
2021-01-01-14-00-00
```

(original file names):

```
Text

/dir1/files1/year=2021/month=01/day=01/files2/13-00-00.json
/dir1/files1/year=2021/month=01/day=01/files2/14-00-00.json
```

## Example S3 Source Configuration

> The names defined for `file_groups` (“my_file_group” in this example) should match the `file_groups` used in the transform configuration section.

JSON

```
{
    "source": {
        "type": "s3",
        "endpoint": "http://some.endpoint/",
        "bucket": "my_bucket",
        "file_groups": {
            "my_file_group": {
                "prefix": "some/prefix/",
                "file_matcher_syntax": "glob",
                "file_matcher_pattern": "**.json",
                "sort_type": "extract_timestamp",
                "path_timestamp_pattern": "'dir1/files1/'yyyy'-'MM'-'dd'T'HH':'mm':
            }
        },
        "compression": "gzip"
    },
    "transform" : {
        "file_groups" : {
            "my_file_group" : {
                "tables" : {
                    ...
                }
            }
        }
    }
}
```

## Example Local File Source Configuration

ⓘ The names defined for `file_groups` (“my_file_group” in this example) should match the `file_groups` used in the transform configuration section.

JSON

```
{
    "source": {
        "type": "local",
        "file_groups": {
            "my_file_group": {
                "prefix": "/path/to/data/directory/",
                "file_matcher_syntax": "glob",
                "file_matcher_pattern": "**.json",
                "sort_type": "extract_timestamp",
                "path_timestamp_pattern": "'dir1/files1/'yyyy'-'MM'-'dd'T'HH':'mm':
            }
        },
        "compression": "gzip"
    },
    "transform" : {
        "file_groups" : {
            "my_file_group" : {
                "tables" : {
                    ...
                }
            }
        }
    }
}
```

## Common File Source Configuration

`source.file_groups`

An object that maps file group names to their corresponding configuration objects.

| **Type:** | **object** |
|---|---|
| Required: | Yes |
| Default: | |

`source.file_groups.<file_group_name>`

The configuration object for a file group.

| Type: | object |
| --- | --- |
| Required: | Yes |
| Default: | |

`source.file_groups.<file_group_name>.prefix`

For an S3 Source, the `prefix` is used to get a subset of S3 objects from the bucket. A more specific prefix can improve time required to list files in S3 sources.

For a Local File Source, `prefix` is an absolute or relative path from the working directory of the LAT. In either case, the path can be a file or a directory. If the path is a directory, LAT tries to load all files recursively under this path. When looking for files, LAT follows the symbol links. LAT only loads regular files that are readable and not hidden. Note that shell-specific expansions like `~` are not supported.

You can include multiple prefixes for a single file group if you specify this property as an array of strings. In that case, the LAT loads all files that are under any of the prefixes in that array. The system loads files that match more than one prefix within a single file group only once.

> ⚠ For a Local File Source, the path used for prefix is the path on the server where the LAT is running, which might not be the same machine where you are running the LAT Client Command Line Interface to create your pipeline.

| Type: | string or string array |
| --- | --- |
| Required: | No |
| Default: | `""` |

`source.file_groups.<file_group_name>.file_matcher_syntax`

The `file_matcher_syntax` defines the type of syntax used by the `file_matcher_pattern` setting, which includes matching files in the file group. The pattern is applied to the fully qualified filename in the list of files found under the `prefix`.

See the `file_matcher_pattern` description for examples and complete syntax details for `glob` and `regex` options.

| Type: | string |
| --- | --- |
| Required: | No, although it is not valid to have only one of `file_matcher_syntax` or `file_matcher_pattern` be provided |
| Default: | `glob` |

Allowed values:

- `glob` - a simplified pattern matching system based on wildcards
- `regex` - a regular expression syntax

`source.file_groups.<file_group_name>.file_matcher_pattern`

The `pattern` used to select files from the `prefix`-filtered list. Files that match the pattern are included in the file group. The **fully qualified filename** (path and filename under the prefix) are matched. Files that do not match are excluded from the file group.

This pattern is also used in the case of LAT **file renaming** - if a `rename_format` is provided, the LAT will attempt to internally rename files using capture groups in the `file_matcher_pattern`. If capture groups are provided in the `file_matcher_pattern`, they will be extracted and placed into the `rename_format` in order to generate a renamed file. Capture groups do *not* need to be named; the captured values are assigned to the `rename_format` sequentially, i.e. the first capture group in the `file_matcher_pattern` will be placed in `{1}` in the `rename_format`.

ⓘ Files are only renamed internally to the LAT to facilitate the file selection process; they are *not* actually renamed locally or on S3.

ⓘ This matched file list can be further filtered using an `extract_timestamp's` pattern and the start/end ranges of any file group type algorithm. See an expanded example in the **File Group Filtering and Sorting example** section.

ⓘ A double backslash within the regular expression is necessary to generate valid escape characters for the `pipeline.json`. For example, the capture group `(\d{4})` needs to be escaped as `(\\d{4})`.

| Type: | string |
| --- | --- |
| Required: | No, although it is not valid to have only one of `file_matcher_syntax` or `file_matcher_pattern` be provided |
| Default: | `**` |

### Example

With a `file_matcher_syntax` of `glob` and `file_matcher_pattern` of `**.json`, all files (after `prefix`-filtering) that end in `.json` will be selected.

> A `**` in the glob based pattern ensures that any pattern including directory boundaries are matched. A pattern `*` does not match the directory character `/`.

### Example

With a `file_matcher_syntax` of `regex`, a `file_matcher_pattern` of `auctions.*-2021.json` would use a regular expression to ensure that files such as `auctions-12-01-2021.json` and `auctions-12-02-2021.json` would be selected.

See `getPathMatcher()` for complete syntax details of the `glob` and `regex` options.

Common Matcher Patterns:

| Matcher Syntax | Pattern | Meaning |
| --- | --- | --- |
| glob | `*` | Matches zero or more characters without crossing directory boundaries |
| glob | `**` | Matches zero or more characters crossing directory boundaries |
| glob | `?` | Matches exactly one character of a name component |
| glob | `[]` | Matches any of the characters in the bracket expression (e.g., [abc]). Supports ranges. |
| regex | `.` | Matches any character |
| regex | `\d` | Matches any digit |
| regex | `\D` | Matches any non-digit |
| regex | `[]` | Matches any of the characters in the bracket expression (e.g., [abc]). Supports ranges. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Matcher Syntax | Pattern | Meaning |
|---|---|---|
| regex | `*` | Matches the preceding character zero or more times |
| regex | `+` | Matches the preceding character one or more times |
| regex | `?` | Matches the preceding character once or not at all |

`source.file_groups.<file_group_name>.rename_format`

A Java® `MessageFormat` string. Captured groups from the `file_matcher_pattern` will be placed into the `rename_format` string's format elements corresponding to the order they were captured. The renamed file is used for subsequent sorting of files. When using `lexicographic` sort, the renamed file is used instead of the original filename. For `extract_timestamp` sorting, the `path_timestamp_pattern` is applied against the renamed file. This is best elucidated with an example:

Text

```
filename: 20210102.json
file_matcher_pattern: (\\d{4})(\\d{2})(\\d{2}).*
rename_format: "file-{1}-{3}-{2}"
"sort_type": "extract_timestamp"
"path_timestamp_pattern": "'file-'yyyy'-'MM'-'dd"

Renames the file to: "file-2021-02-01"
The "path_timestamp_pattern" extracts an ISO-8601 datetime of 2021-02-01T00:00:00Z
```

Files are only renamed internally to the LAT to facilitate the file selection process; they are *not* actually renamed locally or on S3.

| Type: | string |
|---|---|
| Required: | No |
| Default: | None - if `rename_format` is not provided, files will not undergo a rename step. |

`source.file_groups.<file_group_name>.sort_type`

Defines the sorting algorithm used for sorting the files selected for loading in this file group by time. Files should be sorted in time order for best loading performance and the

creation of efficient Ocient segments. `sort_type` can be `extract_timestamp`, `metadata`, or `lexicographic`, and different settings apply to each of these selections.

| **Type:** | **string** |
|---|---|
| Required: | Yes |
| Default: | `none` |

Allowed values:

- `extract_timestamp`: extract the timestamp from the filename or file path information. Either `path_timestamp_pattern` or `file_timestamp_pattern` is required when choosing this `sort_type`.
- `metadata`: extract the timestamp from the source file's metadata. This option uses the file last modified time when sorting the list.
- `lexicographic`: sort files based on the alphanumeric sort of files in the file group using the full path and filename as the sorting key.

> The system breaks the tie among files in a lexicographic way by using their fully qualified original file names.

### `source.file_groups.<file_group_name>.path_timestamp_pattern`

A Format string with `DateTimeFormatter` patterns used to extract a datetime from the path portion of a file's fully-qualified filename. This timestamp is used with the `extract_timestamp` sort type to order the selected files in the file group prior to loading. It is attempted on every file's fully-qualified filename under the `prefix`; files that do not match the pattern will be skipped and the remaining subset will be used for sorting.

| **Type:** | **string** |
|---|---|
| Required: | One of `path_timestamp_pattern` or `file_timestamp_pattern` is required for an `extract_timestamp` sort type file group |
| Default: | `none` |

### `source.file_groups.<file_group_name>.file_timestamp_pattern`

A Format string with `DateTimeFormatter` patterns used to extract a datetime from the base filename of a file's fully-qualified filename. This timestamp is used with the `extract_timestamp` sort type to order the selected files in the file group prior to loading. It is attempted on every file's base filename under the `prefix`; files that do not match the pattern will be skipped and the remaining subset will be used for sorting.

| **Type:** | **string** |
|---|---|
| Required: | One of `path_timestamp_pattern` or `file_timestamp_pattern` is required for an `extract_timestamp` sort type file group |
| Default: | `none` |

`source.file_groups.<file_group_name>.start_time`

An ISO-8601 compliant Date or Datetime, used as the lower bound to filter for files in a `extract_timestamp` or `metadata` sort type file group. Datetimes are UTC unless a timezone is provided. Inclusive.

| **Type:** | **string** |
|---|---|
| Required: | No |
| Default: | `Instant.MIN` |

`source.file_groups.<file_group_name>.stop_time`

An ISO-8601 compliant Date or Datetime, used as the upper bound to filter for files in a `extract_timestamp` or `metadata` sort type file group. Datetimes are UTC unless a timezone is provided. Exclusive.

| **Type:** | **string** |
|---|---|
| Required: | No |
| Default: | `Instant.MAX` |

*Extract Timestamp Default Values *

With an `extract_timestamp` `sort_type`, if a certain time unit is not provided, they will default to their respective value in `1970-01-01T00:00:00.000000`.

**Example:**

```
Text

Filename: `July03.json`
`path_timestamp_pattern` or `file_timestamp_pattern`: `MMMMdd'.json'`
```

The full timestamp extracted from this filename will be `1970-07-03T00:00:00.000000 UTC`.

---

**Potential Pitfalls**

Pitfall 1: This default value should be considered when a `start_time` or `stop_time` is provided but a certain time unit is not present within the filename.

**Example:**

```
Text

Capture files ranging from July 1st through July 3rd:

Filenames: July01.json, July02.json, July03.json
"file_timestamp_pattern": "MMMMdd'.json'"
"start_time": "1970-07-01"
"stop_time": "1970-07-04"
```

Note that 1970 was used as the year in the `start_time` and `stop_time`, but the system could not extract a year from the filenames. An alternative strategy is to use the File Renaming step to insert missing dates or times.

Pitfall 2: Only applicable to using the `extract_timestamp` `sort_type` with `start_time` and `stop_time`: Consider the time unit granularities between your pattern and start/stop times.

**Example:**

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

Text

```
Filenames: dir1/2021/01/01/00:00:00.json, dir1/2021/01/01/01:00:00.json, dir1/2021/
"path_timestamp_pattern": "'dir1/'yyyy'/'MM'/'dd'/'"
"start_time": "2021-01-01T00:00:00"
"stop_time": "2021-01-01T04:00:00"
```

Given this configuration, one might expect that the files that are hour 4 and later would be filtered out. However, because the pattern does not extract the times from the filenames, each file's extracted datetime in ISO 8601 format is `2021-01-01T:00:00:00UTC`, so no files are outside the range and filtered. Make sure to extract as much information about the datetime as necessary.

`source.file_groups.<file_group_name>.start_file`

A string, used as the lower bound to filter for files in a `lexicographic` sort type file group. Inclusive.

| **Type:** | **string** |
|---|---|
| Required: | No |
| Default: | `none`, but a `lexicographic` sort type file group will not check for a lower bound if this is not present. |

`source.file_groups.<file_group_name>.stop_file`

A string, used as the upper bound to filter for files in a `lexicographic` sort type file group. Inclusive.

| **Type:** | **string** |
|---|---|
| Required: | No |
| Default: | `none`, but a `lexicographic` sort type file group will not check for an upper bound if this is not present. |

`source.file_groups.<file_group_name>.compression`

The compression method for the files in this file group. If this value is set, it will override `source.compression`; if not set, it will inherit `source.compression`. See

`source_compression` for available options.

| **Type:** | **string** |
|---|---|
| Required: | No |
| Default: | `null` |

### `source.file_groups.<file_group_name>.bucket`

This setting is available only for S3 sources.

If specified, this setting overrides the source-wide bucket for this file group. This allows loading from multiple buckets at once within the same pipeline.

If a `bucket` is specified for every file group, you can omit the `source.bucket`.

| **Type:** | **string** |
|---|---|
| Required: | No |
| Default: | `null` |

### `source.partitions`

The number of partitions for each file group. For example, if there are two file groups and `partitions` is set to 32, then a total of 64 partitions will exist, with 32 for each file group. The partition index is 0-based for each file group. In the above example, each file group will have partitions `[0, 31]`.

⚠ When `partitions` is specified for a load, its value must not change for the lifetime of this load, otherwise records cannot load correctly.

ⓘ When using the LAT Client, `partitions` will be automatically assigned by the client. If it is set in the source configuration provided by the user, it will be overwritten.

| Type: | int |
| --- | --- |
| Required: | No |
| Default: | Set by the LAT client |

`source.partitions_assigned`

A 2-element array indicating the minimum and maximum partition indices that this LAT Node owns, inclusive on both ends. For example, `[0, 15]` means that the node owns Partitions 0, 1, 2, ..., 15. The first element should be greater than or equal to 0. The second element should be greater than or equal to the first element, and less than the number of partitions.

> When using the LAT Client, `partitions_assigned` will be automatically assigned by the client. If it is set in the source configuration provided by the user, it will be overwritten.

| Type: | int array |
| --- | --- |
| Required: | No |
| Default: | Set by the LAT client |

`source.compression`

The compression method for the files. Currently, only `none` and `gzip` are supported. `none` means that the files are not compressed. Note that this value sets the default compression method for all the files from this source, and it can be overridden by `source_file_groups_compression` per file group.

| Type: | string |
| --- | --- |
| Required: | No |
| Default: | `none` |

`source.chunk_size`

The size of a chunk when fetching data. For example, if you have a 40 MB file and the chunk size is 16 MB, you can issue three requests sequentially to get the file. The unit is

MB. The value must be greater than 0.

> The chunk size should be larger than or equal to the maximum record size.

| **Type:** | **int** |
|---|---|
| Required: | No |
| Default: | `16` |

`source.buffer_size`

The total buffer size for *all* assigned partitions. This value will be divided by the total number of assigned partitions to calculate each partition's buffer size. For example, if this value is 4096, `source.partitions` is 16, `source.partitions_assigned` is `[0, 3]`, and you have two file groups, then you have a total of (3-0+1)*2=8 assigned partitions, and each partition will get 4096/8=512 MB as the buffer size. The unit is MB. The value must be greater than 0.

> The buffer size *per partition* must be at least twice the value of `source.chunk_size`.

| **Type:** | **int** |
|---|---|
| Required: | No |
| Default: | `4096` |

`source.max_fetch_concurrency`

The maximum concurrency when fetching files for each partition. Setting this configuration too high can result in thread contention. The value must be greater than 0.

| **Type:** | **int** |
|---|---|
| Required: | No |
| Default: | `2` |

## S3 Source-Specific Configuration

`source.endpoint`

The endpoint for the S3 instance, usually starting with `http` or `https`. It can be an IP address or a domain. For example, for AWS S3 in the `us-east-2` region, endpoint would be `https://s3.us-east-2.amazonaws.com`. The S3 Source supports Virtual-hosted-style access and Path-style access. The `s3://` protocol based access is not supported. For more details, see **Methods for Accessing an S3 Bucket**

| **Type:** | **string** |
|---|---|
| Required: | Yes |
| Default: | |

`source.region`

The region for the S3 instance. This is mostly used for AWS S3 instances.

| **Type:** | **string** |
|---|---|
| Required: | No |
| Default: | `us-east-2` |

`source.bucket`

The bucket from which to get S3 objects.

You can override the bucket on a per-file group basis by setting the `source.file_groups.<file_group_name>.bucket`.

This setting is required unless it is specified for every file group.

| **Type:** | **string** |
|---|---|
| Required: | No |
| Default: | |

`source.path_style_access`

Whether to force path style access for the S3 instance. If set to `false`, LAT will try to use the virtual-hosted style (using DNS subdomains), and falls back to the path style access.

AWS S3 is deprecating path style access according to **this post**.

| **Type:** | **boolean** |
|---|---|
| Required: | No |
| Default: | `false` |

`source.access_key_id`

The access key for the S3 instance. This should be used together with the `source.secret_access_key` setting. If either of them is absent, LAT will default to the next item in the credentials hierarchy. See **S3 Credentials Hierarchy**.

| **Type:** | **string** |
|---|---|
| Required: | No |
| Default: | `null` |

`source.secret_access_key`

The access secret for the S3 instance. This should be used together with the `source.access_key_id` setting. If either of them is absent, LAT will default to the next item in the credentials hierarchy. See **S3 Credentials Hierarchy**.

| **Type:** | **string** |
|---|---|
| Required: | No |
| Default: | `null` |

`source.session_token`

Temporary credentials can be made with a combination with the existing secret ID and secret key, and an additional session token. Note that this is only used when both `source.access_key_id` and `source.secret_access_key` are specified.

| Type: | string |
| --- | --- |
| Required: | No |
| Default: | `null` |

`source.retries`

Configures the number of retries that will be attempted when download from S3 source fails.

| Type: | int |
| --- | --- |
| Required: | No |
| Default: | Default attempts specified in AWS SDK. |

`source.backoff_strategy_base_delay_seconds`

Configures the base delay for the backoff strategy of the S3 client in seconds.

| Type: | int |
| --- | --- |
| Required: | No |
| Default: | 1 |

`source.backoff_strategy_max_backoff_seconds`

Configures the maximum backoff delay for the backoff strategy of the S3 client in seconds.

| Type: | int |
| --- | --- |
| Required: | No |
| Default: | For the default delay, see the **AWS SDK documentation**. |

`source.max_pending_connection_acquires`

Configures the maximum number of pending acquires allowed by the Netty client.

| **Type:** | **int** |
|---|---|
| Required: | No |
| Default: | For the default number of acquires, see the **AWS SDK documentation.** |

`source.netty_read_timeout_seconds`

Configures the read timeout, in seconds, of the Netty client. When you set this value to zero, the system disables the read timeout. The LAT configures read timeouts to be tried again by the S3 Client.

| **Type:** | **int** |
|---|---|
| Required: | No |
| Default: | For the default timeout value, see the **AWS SDK documentation.** |

`source.connection_timeout_seconds`

Configures the amount of time in seconds for the Netty client to wait when initially establishing a connection before giving up and timing out. The LAT configures connection timeouts to be retryable by the S3 Client.

| **Type:** | **int** |
|---|---|
| Required: | No |
| Default: | For the default timeout value, see the **AWS SDK documentation.** |

`source.connection_acquisition_timeout_seconds`

Configures the amount of time in seconds for the Netty client to wait when acquiring a connection from the pool before giving up and timing out. The LAT configures connection acquisition timeouts to be retryable by the S3 Client.

| **Type:** | **int** |
|---|---|
| Required: | No |
| Default: | For the default timeout value, see the **AWS SDK documentation.** |

`source.requester_pays`

Configures whether or not the requester (i.e. the LAT user) should be charged for downloading data from the S3 Requester Pays buckets. This configuration should be set to `true` whenever you request from a Requester Pays bucket, or else the request fails and the bucket owner is charged for the request.

| **Type:** | **boolean** |
|---|---|
| Required: | No |
| Default: | `falsed` |

### S3 Credentials Hierarchy

The S3 source configuration supports the following hierarchy to obtain S3 credentials. If the LAT does not obtain the credentials at a level, the LAT tries the lower level.

- Level 1: Pipeline configuration
- Level 2: **AWS SDK Default Credential Provider Chain**
- Level 3: (Default) Anonymous access

> You can choose the level to store the credentials where Level 1 is the highest. Higher levels take precedence for credential storage.

## Load from a Kafka Source

The Apache® Kafka® Source allows LAT to connect to a Kafka cluster and process records from one or more topics. You can reference each Kafka topic in the **LAT Transform Configuration** and can load into one or more tables.

In addition to the LAT specific configuration, this Source supports configuration passthrough to the underlying **Kafka library** which this Source uses. There are some library configurations which are not allowed, and will be noted in this table.

### Example Kafka Source Configuration

JSON

```
{
    "source": {
        "type": "kafka",
        "kafka": {
            "bootstrap.servers": "127.0.0.1:9092",
            "auto.offset.reset": "earliest"
        }
    }
}
```

## Kafka Configuration

`source.end_offsets_polling_duration`

Frequency with which to poll for end offsets for lag calculation, in milliseconds.

| **Type:** | **int** |
| --- | --- |
| Required: | No |
| Default: | 30000 |

`source.kafka`

Kafka consumer configuration object. See **ConsumerConfig** for details.

| **Type:** | **object** |
| --- | --- |
| Required: | Yes |
| Default: | |

`source.kafka`

Required Keys:

- `kafka.bootstrap.servers`
  - This key is required for connection information to the Kafka servers.

Common Keys:

- `kafka.auto.offset.reset`
  - This key is commonly set to `earliest` to consume all of the data in an existing Kafka topic.

## Disallowed Kafka Configuration

The following Kafka consumer configuration options are not allowed:

- `kafka.enable.auto.commit`
  - LAT will always internally set this configuration to `false`; it is critical for correct operation to do so.
- `kafka.key.deserializer`
  - LAT will always internally configure deserialization
- `kafka.value.deserializer`
  - LAT will always internally configure deserialization

If any of the disallowed Kafka library configurations are set, a warning will be logged and their configurations will be ignored.

## Defaulted Kafka Configuration

- `kafka.group.id`
  - If unset. LAT will configure `group.id` internally using the value of `ocient-lat-[$pipeline_id]`. Most users should leave this unset unless they want to explicitly control the `group.id` that is being used.

# LAT Sink Configuration

(deprecated) Configure Ocient LAT pipeline sinks to write transformed data into Ocient tables or other targets, including batching, commit, and error-handling options.

> ⚠ Data Pipelines are now the preferred method for loading data into the Ocient® System. For details, see **Load Data**. The LAT loading functionality will be removed in version 29.0.

The Sink Configuration controls the destination of data in the LAT Pipeline.

## `sink`

A sink configuration object.

Required keys:

- **sink.type**

## `sink.type`

Type of sink to use in the pipeline.

| **Type:** | **string** |
|---|---|
| **Required**: | Yes |
| **Default**: | |

Allowed values:

- `ocient` : see **Ocient Sink** for additional configuration.
- `file` : see **File Sink** for additional configuration.

## Ocient Sink

The Ocient Sink allows LAT to connect to an Ocient cluster to write rows to one or more tables.

Required keys:

- **sink.remotes**

`sink.remotes`

Array of one or more Ocient Loader Nodes, in `host:port,...` format

| **Type:** | **string[]** |
|---|---|
| **Required**: | Yes |
| **Default**: | |

`sink.batch_records`

Number of records to buffer per partition before flushing records to Ocient

| **Type:** | **int** |
|---|---|
| **Required**: | No |
| **Default**: | 1000 |

`sink.batch_duration`

Time based flushing parameter, in milliseconds. Records will flush to Ocient after this duration has elapsed with no new activity, even if fewer than `batch_records` records have been processed.

| **Type:** | **int** |
|---|---|
| **Required**: | Yes |
| **Default**: | 30000 |

`sink.idle_partition_polling_period`

Time based polling parameter, in milliseconds. This Sink will periodically poll the remote for progress on write durability for idle partitions.

| **Type:** | **int** |
|---|---|
| **Required**: | No |
| **Default**: | 60000 |

`sink.request_timeout`

Request timeout when communicating with Ocient remotes, in milliseconds.

| **Type:** | **int** |
|---|---|
| **Required**: | No |
| **Default**: | 300000 |

`sink.request_backoff`

Duration to delay after a failed request to an Ocient remote prior retrying, in milliseconds.

| **Type:** | **int** |
|---|---|
| **Required**: | No |
| **Default**: | 1000 |

`sink.request_jitter`

Additional duration to delay after a failed request to an Ocient remote prior retrying, in milliseconds. The total delay incurred prior to a given retry is `request_backoff + rand(0, request_jitter)`.

| **Type:** | **int** |
|---|---|
| **Required:** | No |
| **Default**: | 5000 |

### `sink.high_watermark`

High watermark memory point, in bytes. The LAT will stop pushing new rows to memory buffers. It will not resume pushing rows into the memory buffers until `low_watermark` is reached.

| **Type:** | **int** |
|---|---|
| **Required**: | No |
| **Default**: | 1000000000 |

### `sink.low_watermark`

Low watermark memory point, in bytes. After reaching `high_watermark`, the LAT will begin pushing rows to memory buffers again when this memory level is reached.

| **Type:** | **int** |
|---|---|
| **Required**: | No |
| **Default**: | 500000000 |

### `sink.storage_scope_id`

UUID of the storage scope that rows will be associated with. The scope with the given UUID must already exist in the target cluster.

| **Type:** | **string** |
|---|---|
| **Required**: | No |
| **Default**: | `null` |

### `sink.skip_page_replication`

A Boolean value to determine whether to omit page replicas for the specified storage scope. This is ignored if `sink.storage_scope_id` is not specified or has already been seen by the remotes.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| | |
|---|---|
| **Type:** | **boolean** |
| **Required**: | No |
| **Default**: | `false` |

`sink.netty_event_loop_group_threads`

The number of threads in the Netty event loop group used to communicate with remotes.

| | |
|---|---|
| **Type:** | **int** |
| **Required**: | No |
| **Default**: | `1` |

### Example Ocient Sink Configuration

JSON

```
{
    "sink": {
        "type": "ocient",
        "remotes": ["loader0:5050", "loader1:5050", "loader2:5050"]
    }
}
```

## File Sink

A Sink type for **testing** LAT pipelines that writes the transformed data to local **JSONL** files.

Required keys:

- **sink.location**

### sink.location

An absolute or relative path to the location that the sink should write files to.

| | |
|---|---|
| **Type:** | **String** |
| **Required**: | Yes |
| **Default**: | |

### Example File Sink Configuration

JSON

```
{
    "sink": {
        "type": "file",
        "location": "out/"
    }
}
```

## External Sink Configuration

Rather than including a sink directly within the pipeline, it is also possible to configure a pipeline to use a sink that is specified externally. Sinks can be managed (created, deleted, and more) using the **LAT Client Command Line Interface**. A sink must exist before a pipeline can use it.

There are three ways to configure a pipeline to use a sink.

1. If a sink is included directly within a pipeline (using the LAT Sink Configuration schema described on this page), it will be used.
2. If a sink is not specified within the pipeline, you can specify a **sink_name** that corresponds to a sink previously created using the LAT Client.
3. If neither `sink` nor `sink_name` is specified in a pipeline, the default sink will be used. If a default sink has not been created using the LAT Client, a pipeline must specify either a `sink` or a `sink_name`.

# LAT Extract Configuration

(deprecated) Configure the extract stage of an Ocient LAT pipeline, including source readers, record parsing, format selection, and parallelism for reliable data extraction.

⚠ Data Pipelines are now the preferred method for loading data into the Ocient® System. For details, see **Load Data**. The LAT loading functionality will be removed in version 29.0.

An extract configuration object. This object defines the way that data is extracted from the source records. The extract definition is applied to a specific topic or file group as defined in the source. Keys are file group names or topic names and values are **Extract Settings**.

ⓘ For file based loads, this should match a file_group_name defined in the `source.file_groups` section. For Apache® Kafka® based loads this should match a `topic` defined in Kafka.

Required keys:

- None - Extract defaults to JSON for all topics or file_groups unless provided

## Example Extract

In the following example, two file groups are defined. The file groups defined in the source section are referenced in the extract section to define how data is extracted from the file group. For Kafka based loads, the topic names are used in the extract section to define extraction if required.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

JSON

```
{
    ...,
    "source": {
        "type": "s3",
        "endpoint": "http://some.endpoint/",
        "bucket": "my_bucket",
        "file_groups": {
            "delimited_user_data": {
                "prefix": "crm/users/",
                "file_matcher_syntax": "glob",
                "file_matcher_pattern": "**.csv",
                "sort_type": "lexicographic"
            },
            "delimited_order_data": {
                "prefix": "crm/orders/",
                "file_matcher_syntax": "glob",
                "file_matcher_pattern": "**.json",
                "sort_type": "lexicographic"
            }
        }
    },
    "extract": {
        "delimited_user_data": {
            "record_type": "delimited",
            "headers": ["id", "username", "last_login_at", null, "first_name", "las
            "field_delimiter": "|",
            "trim_whitespace": true,
            "skip_blank_lines": true,
            "field_optionally_enclosed_by": "\"",
            "null_strings": ["NULL", "N/A"]
        },
        "delimited_order_data": {
            "record_type": "delimited",
            "num_header_lines": 1,
            "exclude_columns": ["user_id", "order_total"],
            "field_delimiter": ","
        }
    },
    "transform": {
        ...
```

```
    }
}
```

## Extract Settings

`extract.<file_group_name>.record_type`

Similar to Source and Sink config, `record_type` instructs the Pipeline to instantiate a specific extraction implementation for a given type of source record such as Delimited Records (e.g., CSV, TSV), JSON Records, or Fixed Width Binary Records.

| **Type:** | **string** |
|---|---|
| Required: | No |
| Default: | json |

Allowed values:

- `json` : see **JSON Extract** for additional configuration.
- `delimited` : see **Delimited Extract** for additional configuration.
- `fixed_width_binary` : see **Fixed Width Binary Extract** for additional configuration.

## Shared Extract Configuration

`extract.<file_group_name>.null_strings`

`null_strings` instructs the extraction process to convert a string literal such as *NA* to a `null` value in the transformation layer. This allows different null string values to be provided. `null_strings` must be an array of strings. If `trim_whitespace` is set to true and a string value is trimmed to become a `null_string`, that value converts to `null`.

| **Type:** | **string[]** |
|---|---|
| Required: | No |
| Default: | |

## `extract.<file_group_name>.empty_as_null`

The `empty_as_null` setting specifies whether empty fields should be treated as null. An empty field is defined as a string field containing no characters (its length is 0). When set to false, empty fields will be treated literally as empty strings. When set to true, empty fields will be treated as `null` in the transformation and loading process. If `trim_whitespace` is set to true and `empty_as_null` is set to true, a field that consists of only whitespace will also be converted to `null`.

| **Type:** | **boolean** |
|---|---|
| Required: | No |
| Default: | True for the Delimited and FWB extract types, False for a JSON extract type |

## `extract.<file_group_name>.trim_whitespace`

The `trim_whitespace` setting specifies whether whitespace should be trimmed from the beginning and end of each string field as it is extracted.

| **Type:** | **boolean** |
|---|---|
| Required: | No |
| Default: | False |

## `extract.<file_group_name>.encoding`

The `encoding` setting specifies the file encoding to use. Encodings should use standard Java® encodings defined in the **Java Internationalization Guide**.

| **Type:** | **string** |
|---|---|
| Required: | No |
| Default: | UTF8 |

## `extract.<file_group_name>.replace_invalid_characters`

`replace_invalid_characters` defines whether invalid characters based on the encoding type should be replaced with a replacement character (i.e. `U+FFFD`). If this setting is false and invalid characters are encountered, the record will not be loaded and a record extraction error will be logged.

| **Type:** | **boolean** |
|---|---|
| Required: | No |
| Default: | False |

# JSON Extract

The JSON Extract type allows LAT to extract JSON data from the source records. There are no additional configuration settings available for JSON beyond the common Extract settings.

## Example JSON Extract Configuration

In this example JSON extract configuration, the `replace_invalid_characters` setting is used to convert any invalid UTF-8 characters with the UTF-8 replacement character. The file group name assigned to this file group was defined as “json_user_data” in the `source` section of the pipelines. When transforming this data, you can reference columns by the JSON object keys.

JSON

```
{
    "extract": {
        "json_user_data" : {
            "record_type": "json",
            "replace_invalid_characters": true
        }

    },
    ...
}
```

# Delimited Extract

The Delimited Extract type allows the LAT to extract delimited data from the source records. The delimiter character is configurable to support CSV, TSV, or other delimited formats like pipe and semicolon. Fixed width files are a separate extraction type.

## Notes on Delimited Files

- Delimited files can have additional comment rows that are prefixed by a `#` character. These lines are not processed and will be skipped during loading.
- A maximum number of 1024 columns can be loaded in a single delimited file.
- You can enclose fields with an optional enclosure character. In these cases, the enclosure character is not retained in the loaded data.
- You can skip a configurable number of header lines during loading to prevent column headers from appearing as loaded data.

The system parses headers from the beginning of each file if you configure **num_header_lines** and do not configure **headers**.

The system automatically names columns if you do not configure **num_header_lines** and **headers**. The columns are named “0","0","1”, and so on consecutively instead.

- You can define multiple file groups. This allows different delimited extraction settings on each file group.
- The default record delimiter is a `\n` newline character. If source data differs, this should be overridden.

Records with improperly escaped “quote characters” or malformed “quoting” of column data will not parse. See the **num_header_lines** setting for more details.

- Control characters such as the NULL byte `0x0` are automatically processed as whitespace when parsing delimited records.

## Delimited Configuration

`extract.<file_group_name>.field_delimiter`

The `field_delimiter` specifies the string that should function as a column delimiter. The field_delimiter character applies to any unquoted and unescaped text when extracting

records from the source file. This can be a single character or a multi-character string delimiter. Only one field_delimiter string is allowed per extract.

| **Type:** | **string** |
|---|---|
| Required: | No |
| Default: | , |

### `extract.<file_group_name>.record_delimiter`

The `record_delimiter` specifies the string that indicates the end of a record. The record_delimiter character applies to any unquoted and unescaped text when extracting records from the source file. This can be a single character or a two-character string delimiter. Only one `record_delimiter` string is allowed per extract.

> The default is a standard newline character `\n`. Depending on the file, typical settings for this delimiter are a newline `\n`, a carriage return `\r` or a carriage return and newline `\r\n`.

| **Type:** | **string; maximum 2 characters** |
|---|---|
| Required: | No |
| Default: | \n |

### `extract.<file_group_name>.field_optionally_enclosed_by`

Also referred to as the “quote character,” the `field_optionally_enclosed_by` settings specifies the character that is optionally used to enclose a field or column. The data between enclosure characters can contain delimiter characters. The enclosure character itself must be escaped inside of an enclosed field. Common values are `"` to enclose fields by double quotes. Because this setting defines an optional enclosure, not all fields in the record need to be enclosed. The `escape` character used to escape the enclosure character is separately configured and defaults to `"` per the RFC-4180 standard.

| **Type:** | **string; maximum 1 character** |
|---|---|
| Required: | No |

| | |
|---|---|
| **Type:** | **string; maximum 1 character** |
| Default: | ” |

**Example:**

In the following pipe delimited record, the double quote character can be specified so that the final column will be `this field has a | in it` when loaded into the database. If no enclosure character is specified, this record would yield four columns instead of three.

Text

```
a|b|"this field has a | in it"
```

### `extract.<file_group_name>.escape`

The `escape` settings specifies the character that is used as an escape occurrences of the enclosing character used to value so that the following character is escaped. This is typically used in enclosed columns to escape the enclosure character defined as `field_optionally_enclosed_by`.

| | |
|---|---|
| **Type:** | **string; maximum 1 character** |
| Required: | No |
| Default: | “ |

### `extract.<file_group_name>.num_header_lines`

The `num_header_lines` setting defines the number of header lines in the source. The system reads these header lines but does not load them as data.

If you do not specify **headers**, the system uses the final line within this section to name the columns in each file. Then, the system uses these names in the Transform section to refer to column values. The system names columns for each file, so the names available in the Transform section might change if the file header changes.

⚠ This setting only applies to file-based source types.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Type: | int |
| --- | --- |
| Required: | No |
| Default: | 0 |

## `extract.<file_group_name>.headers`

The `headers` setting defines the header labels associated with each column in a delimited file. This array of values is associated with the columns in order from left to right. The strings assigned to the column names are used in the Transform section to refer to column values. Any explicitly supplied headers that are an empty string `""` or a `null` literal will be skipped during extraction. This can have performance benefits if all columns are not needed.

| Type: | string[] |
| --- | --- |
| Required: | No |
| Default: | null |

## `extract.<file_group_name>.include_columns`

The `include_columns` setting restricts extraction to the columns with the specified names. If you do not need all columns during transformation, you might improve performance when you use the `include_columns` setting.

If there are no headers and you specify this setting, the system names columns based on their original positions before other columns are filtered out. For example, if there are four columns and `$0` and `$3` are included, the system names these columns `$0` and `$3` during transformation, not `$0` and `$1`.

If you specify the `exclude_columns` setting, you cannot specify this setting.

| Type: | string[] |
| --- | --- |
| Required: | No |
| Default: | null |

## `extract.<file_group_name>.exclude_columns`

The `exclude_columns` setting causes the LAT to not extract any of the specified columns. If you do not need all columns during transformation, you might improve performance when you use the `exclude_columns` setting.

If there are no headers and you specify this setting, the system names columns based on their original positions before other columns are filtered out. For example, if there are four columns and `$1` and `$2` are excluded, the system names these columns `$0` and `$3` during transformation, not `$0` and `$1`.

If you specify the `include_columns` setting, you cannot specify this setting.

| **Type:** | **string[]** |
|---|---|
| Required: | No |
| Default: | null |

## `extract.<file_group_name>.skip_blank_lines`

The `skip_blank_lines` setting specifies whether lines with only whitespace should be skipped or processed.

| **Type:** | **boolean** |
|---|---|
| Required: | No |
| Default: | False |

## `extract.<file_group_name>.skip_comment_lines`

The `skip_comment_lines` setting specifies whether lines with a leading comment character should be skipped or processed.

| **Type:** | **boolean** |
|---|---|
| Required: | No |
| Default: | true |

`extract.<file_group_name>.comment_character`

The `comment_character` setting specifies which character represents the start of a comment line.

| **Type:** | **string; maximum 1 character** |
|---|---|
| Required: | No |
| Default: | '#' |

## Example Delimited Extract Configuration

In this example extract configuration, a pipe delimited file type with five column names is provided. The file group name assigned to this file group was defined as "delimited_user_data" in the `source` section of the pipelines. Whitespace will be trimmed from each field and blank lines will be skipped instead of reporting errors. Fields with special characters can be escaped by `"`. Any literal values of `NULL` or `N/A` are converted to `null`. When transforming this data, columns can be referred to by `id`, `username`, `last_login_at`, `first_name`, and `last_name`. The fourth column is listed as `null` in the header, so it will be skipped during extraction. Because `num_header_lines` is not specified, the files are assumed to have no headers.

JSON

```
{
    "extract": {
        "delimited_user_data": {
            "record_type": "delimited",
            "headers": ["id", "username", "last_login_at", null, "first_name", "las
            "field_delimiter": "|",
            "trim_whitespace": true,
            "skip_blank_lines": true,
            "include_columns": ["id", "username", "last_name"],
            "field_optionally_enclosed_by": "\"",
            "null_strings": ["NULL", "N/A"]
        },
        ...
    },
    ...
}
```

# Fixed Width Binary Extract

The Fixed Width Binary (FWB) Extract type allows the LAT to extract data from binary source records that have a fixed number of bytes per column. FWB source records typically come from sources like mainframe systems like the IBM® Z® series that use Cobol Copybooks to produce character, integer, floating point, and decimal data in various byte formats. The FWB Extract type requires users to specify the byte offset, width in bytes, and the type of extraction to use on the indicated bytes for each column. The FWB type also allows users to specify a record length in bytes rather than a character record delimiter. FWB files are typically extracted using `encodings` such as `cp500` and `cp037`.

## Fixed Width Binary Data Types

The following data types are supported when extracting Fixed Width Binary data. All data types require specification of `offset` and `width` to locate the bytes to extract in each record.

| Data Type | Description | Supported Settings |
|---|---|---|
| string | Represents bytes of character data following the encoding defined in the extract settings. Bytes are extracted into a string for transformation and loading. | `encoding` - inherited |
| integer | Represents a signed integer. Uses the `endianness` setting to determine how bytes should be interpreted. The `integer` type can be used for 1, 2, 4, or 8 bytes of data. These correspond to mainframe concepts of a Byte, Half-word, Full-word, and Double-word. | `endianness` - inherited |
| unsigned_integer | Represents a unsigned integer. Uses the `endianness` setting to determine how bytes should be interpreted. Can be used for 1, 2, 4, or 8 bytes of data. The largest integer data type in the Ocient System is a signed BIGINT, so the maximum value for an `unsigned_integer` is 2^63-1. | `endianness` - inherited |
| float | Represents a floating point number as defined by the IEEE®-754 floating point specification. Can be used for 4 or 8 bytes of data. 4 bytes represents a single precision floating point number, and 8 bytes represents a double precision floating point number. | |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Data Type | Description | Supported Settings |
|---|---|---|
| packed_decimal | A Packed Binary Coded Decimal format for decimal precision that packs two integral values in each byte and encodes the sign in the final byte. The number of decimal points represented by the data is supplied with a separate extraction setting. The sign is encoded in the 4 least significant bits of the final byte. A value of `0xD` or `0xB` indicates a negative sign. Any other value including the common values of `0xF`, `0xE`, `0xC` or `0xA` indicating positive or unsigned. | `endianness` - inherited<br>`decimals` - number of digits to place the right of the decimal point<br>`sign_format` - defaults to 'trailing' byte format indicating that the sign is encoded in the most significant four bits of the final byte; provided for future extensibility. |
| zoned_decimal | A Zoned Binary Coded Decimal format for decimal precision that packs two integral values in each byte and encodes the sign in the final byte. The number of decimal points represented by the data is supplied with a separate extraction setting. The sign is encoded in the 4 most significant bits of the final byte. A value of `0xD`, `0xB`, `0x7` indicates a negative sign. Values of `0xF`, `0xE`, `0xC` or `0xA` indicate positive or unsigned. | `endianness` - inherited<br>`decimals` - number of digits to place the right of the decimal point<br>`sign_format` - defaults to 'trailing' byte format indicating that the sign is encoded in the most significant four bits of the final byte; provided for future extensibility. |

# Fixed Width Binary Configuration

### `extract.<file_group_name>.record_width`

The `record_width` setting specifies the total number of bytes in each record. Files are read serially, and the next record is assumed to start on the following byte. The `record_width` can be greater than the number of bytes used in extracting the individual columns.

| **Type:** | **integer** |
|---|---|
| Required: | Yes |
| Default: | |

### `extract.<file_group_name>.padding_character`

The `padding_character` setting specifies a character in a fixed width file type that should be removed from extracted character data. After extracting a character field, any leading

or trailing occurrences of this character will be stripped from the ends of the character data. Typical examples are the space character or an underscore.

| Type: | string |
| --- | --- |
| Required: | No |
| Default: | ” ” (in the specified encoding) |

### `extract.<file_group_name>.endianness`

The `endianness` setting specifies whether the extraction of numeric fields should use Big Endian or Little Endian byte ordering to process extracted bytes. `endianness` impacts integer, packed_decimal, and zoned_decimal column types.

| Type: | string |
| --- | --- |
| Required: | No |
| Default: | big |

Allowed values:

- `big` : Big Endian
- `little` : Little Endian

### `extract.<file_group_name>.columns`

A extract columns configuration object. A collection of columns and their associated extraction configuration. Keys are column names and values are **Column Extracts configuration**.

Required keys:

- **extract.columns.<columns>**

## Column Extracts

Column extract configurations for Fixed Width Binary records.

### `extract.<file_group_name>.columns.<column>`

A column extract configuration object keyed by a column name. A column's value is defined as an extract definition. The extract definition will indicate the offset and width to locate the bytes to extract, the data type to use in the extraction, and any additional parameters about the bytes to extract.

Required keys:

- offset
- width
- data_type

Optional keys:

- decimals
- sign_format

### `extract.<file_group_name>.columns.<column>.offset`

Number of bytes to skip from the beginning of the record before beginning to extract bytes for this column. Note that `offset` is relative to the beginning of the record, so arbitrary offsets can be used including overlapping sets of bytes with other columns.

| **Type:** | **integer** |
| --- | --- |
| Required: | Yes |
| Default: | |

### `extract.<file_group_name>.columns.<column>.width`

Number of bytes to extract from the `offset` location.

| **Type:** | **integer** |
| --- | --- |
| Required: | Yes |
| Default: | |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

### `extract.<file_group_name>.columns.<column>.data_type`

Data type to extract from the bytes that are specified by `offset` and `width`. See **Fixed Width Binary Data Types** for reference on available data types.

| **Type:** | **string** |
|---|---|
| Required: | Yes |
| Default: | string |

Allowed values:

- `string`
- `integer`
- `unsigned_integer`
- `float`
- `packed_decimal`
- `zoned_decimal`

Note that each `data_type` has specific settings that are allowed to control the extraction to that `data_type`. Some of these are inherited from the overall extract configuration, while others are defined on each column.

### `extract.<file_group_name>.columns.<column>.decimals`

The number of numeric values that are placed to the right of the decimal point in a `zoned_decimal` or `packed_decimal` data type. For example, if `decimals` is set to `2` and the data in a `zoned_decimal` represents the numerals `12345`, this would create the decimal `123.45` in the extracted value.

> `decimals` configures the `scale` of the extracted decimal and the total number of digits present in the source data determines the precision. If insufficient scale or precision exists in the target Ocient column, data will fail to load.

| **Type:** | **integer** |
|---|---|
| Required: | No |

| Type: | integer |
| --- | --- |
| Default: | 0 |

Applies to:

- `packed_decimal`
- `zoned_decimal`

### `extract.<file_group_name>.columns.<column>.sign_format`

In decimal types, the sign for the number can be encoded in different ways. Currently, only the `trailing` format is supported which requires the sign to be encoded in four bits of the last byte in the column data. This setting is provided for future extensibility. The values that indicate a positive or negative sign are listed in **Fixed Width Binary Data Types**.

| Type: | string |
| --- | --- |
| Required: | No |
| Default: | trailing |

Allowed values:

- `trailing` - the sign is encoded in the most significant four bits of the last byte in the binary coded decimal.

Applies to:

- `packed_decimal`
- `zoned_decimal`

## Fixed Width Binary Extract Example

The following example illustrates extracting fixed width binary data from a file group that was given the name “order_files” in the `source` section of the pipeline. The file has 3100 bytes per record and is only extracting a few columns.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

JSON

```
{
    "extract": {
        "order_files": {
            "record_type": "fixed_width_binary",
            "record_width": 3100,
            "endianness": "big",
            "columns": {
                "order_id": {
                    "offset": 0,
                    "width": 4,
                    "data_type": "integer"
                },
                "username": {
                    "offset": 4,
                    "width": 20,
                    "data_type": "string"
                },
                "order_total": {
                    "offset": 24,
                    "width": 10,
                    "data_type": "packed_decimal",
                    "decimals": 2
                },
                "sales_tax_total": {
                    "offset": 34,
                    "width": 8,
                    "data_type": "zoned_decimal",
                    "decimals": 3
                }
            }
        }
    }
}
```

# LAT Transform Configuration

(deprecated) Configure transform stages in Ocient LAT pipelines using JMESPath, user-defined transformations, and built-in functions to shape data before it is loaded.

⚠ Data Pipelines are now the preferred method for loading data into the Ocient® System. For details, see **Load Data**. The LAT loading functionality will be removed in version 29.0.

## `transform`

A transform configuration object.

Required keys:

- Transform Configuration source only: **transform.topics**
- File sources only: **transform.file_groups**

## `transform.topics`

A collection of topics and their associated configuration. Keys are topic names and values are **topic configuration objects**. Each `<topic>` set as a key in this object represents an Apache® Kafka® topic defined in Kafka.

ⓘ When loading from an `s3` or `local` File Source type, `transform.file_groups` should be used instead of `transform.topics`. Each key in the `file_group` must match a `file_group_name` defined in the Source section of the pipeline configuration.

| | |
|---|---|
| **Type:** | **object** |
| **Required:** | Yes |
| **Default:** | |

## `transform.database`

A database to be used to fully qualify any table names that are not fully qualified.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

For example, if `transform.database` is set to `myDatabase`, a table name of the form `schema.table` will become `myDatabase.schema.table`.

| | |
|---|---|
| **Type:** | **string** |
| **Required:** | No |
| **Default:** | null |

### `transform.schema`

A schema to be used to fully qualify any table names that are not fully qualified. Specifying this property requires that **transform.database** is specified.

For example, if `transform.database` is set to `myDatabase` and `transform.schema` is set to `mySchema`:

- A table name of the form `table` will become `myDatabase.mySchema.table`
- A table name of the form `schema.table` will become `myDatabase.schema.table`
- A table name of the form `database.schema.table` will stay as `database.schema.table`

| | |
|---|---|
| **Type:** | **string** |
| **Required:** | No |
| **Default:** | null |

## Kafka Load Transform Example

JSON

```
{
    ...
    "transform": {
        "topics": {
            "topic_1": {
                "tables": {
                    ...
                }
            },
            "topic_2": {
                "tables": {
                    ...
                }
            }
        }
    }
}
```

## File Based Load Transform Example

Unlike Kafka, File loads define file groups in the source section of the pipeline configuration. The “file_groups” defined in the source and transform sections must match.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

JSON

```
{
    "source": {
        "type": "s3",
        ...
        "file_groups": {
            "file_group_1": {
                ...
            },
            "file_group_2": {
                ...
            },
        }
    }
    "transform": {
        "file_groups": {
            "file_group_1": {
                "tables": {
                    ...
                }
            },
            "file_group_2": {
                "tables": {
                    ...
                }
            }
        }
    }
}
```

## Topics

Topic configuration objects.

Required keys:

- **transform.topics.<topic>.tables**

> For file based loads, `topics` are replaced by `file_groups`, but all other settings are equivalent.

`transform.topics.<topic>.filter`

A record filter to apply at the topic level. See **LAT Record Filtering** for details.

| | |
|---|---|
| **Type:** | **string** |
| **Required:** | Yes |
| **Default:** | |

`transform.topics.<topic>.tables`

A collection of tables and their associated configuration. Keys are table names and values are **columns configuration**.

| | |
|---|---|
| **Type:** | **object** |
| **Required**: | Yes |
| **Default**: | |

## Tables

Table configuration objects.

Required keys:

- **transform.topics.<topic>.tables.<table>.columns**

`transform.topics.<topic>.tables.<table>.filter`

A record filter to apply at the table level. See **LAT Record Filtering** for details.

| | |
|---|---|
| **Type:** | **string** |
| **Required**: | Yes |
| **Default**: | |

`transform.topics.<topic>.tables.<table>.columns`

A collection of columns and their associated configurations. Keys are table names and values are **Columns**.

### Columns

Column transformation configurations.

Required keys:

- **transform.topics.<topic>.tables.<table>.columns.<column>**

`transform.topics.<topic>.tables.<table>.columns.<column>`

A column transformation keyed by a column name. A column's value is defined as a transformation expression. The expression will query the record and return a value that is loaded into the associated column. The grammar of these expressions uses **JMESPath** enhanced with some custom Ocient transformations and User Defined Transformations (UDTs).

| **Type:** | **string** |
|---|---|
| **Required**: | Yes |
| **Default**: | |

## Complex Transform Example

JSON

```
{
    "transform": {
        "database": "adtechdb",
        "schema": "adtech",
        "topics" : {
            "dsp.Auctions" : {
                "tables" : {
                    "auction" : {
                        "columns" : {
                            "auctionid" : "auctionId",

                            "bidder_nodeid" : "bidder.nodeId",
                            "deals_dealid" : "deals[].dealId"
                        }
                    },
                    "trafficSource" : {
                        "columns" : {
                            "auctionid" : "auctionId",
                            "created" : "created",
                            "sourcesellerid" : "trafficSource.sourceSellerId",
                            "domainname" : "trafficSource.domainName",
                            "contextualdataset_externalentryid" : "trafficSource.si
                            "dimensions_hw" : "join('x', [dimensions.height, dimens
                        }
                    },
                    "feedback" : {
                        "columns" : {
                            "auctionid" : "auctionId",
                            "created" : "created",
                            "received" : "received",
                            "campaignid" : "EXPLODE(auctionResponseFeedbacks[].camp
                            "won" : "EXPLODE(auctionResponseFeedbacks[].won)",
                            "winningbid" : "EXPLODE(auctionResponseFeedbacks[].winn
                            "sourcelossreasoncode" : "EXPLODE(auctionResponseFeedba
                        }
                    }
                }
            }
        }
    }
}
```

# LAT Data Transformation with JMESPath

(deprecated) Use JMESPath expressions in Ocient LAT pipelines to transform, filter, and reshape incoming JSON data records before writing them to the data warehouse.

> ⚠ Data Pipelines are now the preferred method for loading data into the Ocient® System. For details, see **Load Data**. The LAT loading functionality will be removed in version 29.0.

Within a transformation each column is configured with a JMESPath expression describing where to extract the column's value and any transformations to apply to that value.

For information on common JMESPath functions and filtering tools, see the **Standard JMESPATH Functions** section.

For a list of functions to modify data during loading, see the **LAT Transformation Functions** page.

Information on customizing your own transformation functions can be found on the **LAT User-Defined Transformations** page.

For expressions to select elements from an array matching certain criteria, see the **LAT Record Filtering** page.

## Notes/Warnings

### JSON Keys with Numbers and Special Characters

You must escape JSON keys that begin with a number or special character in the pipeline configuration.

- For a JSON record: `{ "0_123" : "value" }` transform this record as follows to write "value" to "my_col" --- `{ "my_col" : "\"0_123\"" }`

© 2026 Ocient, Inc

- For a JSON record: `{ "a-col" : 123 }` transform this record as follows to write “value” to “my_col” --- `{ "my_col" : "\"a-col\"" }`

## Case Sensitivity

- The Ocient System normalizes database objects (e.g., table names, column names, schemas) in LAT Transformations according to the same rules as the database unless explicitly escaped with quotes.
  - The Ocient System normalizes all names to lowercase unless explicitly escaped. For example, the transformation: `{ "myCol" : "value" }` normalizes to `mycol` and matches a database column `mycol` that was not escaped at creation time.
  - If you create the database column as an escaped literal such as `"myCol"` then the LAT transformation must be specified as: `{ "\"myCol\"" : "value" }` to correctly map to the column.
- Transformation functions are case sensitive, so represent them by using all lower case letters (e.g., `st_geomfromewkb(my_column)` ).

## Literals

- You must escape literal values with a backtick. This applies to numbers, booleans, and empty arrays (otherwise the Ocient System interprets the value as a JSON transformation operator).

Right:

JSON

```
{
    "column_1": "`0`",
    "column_2": "`1`",
    "column_3": "`true`",
    "column_4": "`[]`"
}
```

Wrong:

JSON

```
{
    "column_1": "0",
    "column_2": "1",
    "column_3": "true",
    "column_4": "[]"
}
```

- You can write string literals with a single quote.

JSON

```
{ "column_1": "'example_value'" }
```

## Loading Numbers in Exponential Notation

When you need to load numbers from exponential notation (e.g. `1.20E-05`), you might require a conversion to load them into the target Ocient column or to perform transformations on the data. Use the `to_number` transformation to load this into a column of type `decimal` or to convert to a numeric value for further transformations like multiplication.

**Example:**

A source record in a CSV file might have a number like `7.00E-05` that appears as a string in the field named `source_field`.

JSON

```
{ "column_1": "to_number(source_field)" }
```

This JSON code converts the string in exponential notation into the double `0.00007` that is now suitable for loading into decimal, double, or float columns, or for use in mathematical transformation functions.

## Flatten, Array Access, and Pipes

For general syntax help for arrays, projections, and pipe expressions, see **JMESPath website**. Flattening arrays, accessing entire arrays, and using pipe expressions are three important operations when you work with nested data in LAT transformations.

- The flatten operator (e.g., `[]`) flattens an array one level. This also removes NULL values from the array.

> ⚠ This can cause unintended consequences if multiple arrays need to remain aligned for data processing.

- When you work with nested arrays, you can maintain array hierarchy. For example, you can replace an array index such as `*` with `[*]` to maintain the hierarchy.
- You can use the pipe operator (e.g., `a.b[*] | [0]`) to stop the projection of an expression into the prior expression.

# LAT Transformation Functions

(deprecated) Reference for built-in transformation functions in Ocient LAT pipelines, including string, numeric, date, and conditional functions used in transform stages.

⚠ Data Pipelines are now the preferred method for loading data into the Ocient® System. For details, see **Load Data**. The LAT loading functionality will be removed in version 29.0.

LAT supports many transformation functions to modify data during loading. The functions include standard JMESPath Functions and Ocient-specific transformation functions.

ⓘ Transformation functions in LAT are case sensitive. The standard syntax for transformation function calls is all lower case characters.

## Standard JMESPath Functions

The following standard JMESPath Functions are supported in LAT Transformation expressions. For details about using these functions, see **JMESPath Functions**.

| JMESPath Function | Function Signature | Example |
|---|---|---|
| abs | number abs(number $value) | abs(num_1) |
| avg | number avg(array[number] $elements) | avg(array_1) |
| contains | boolean contains(array\|string *subject*, *any* subject, anysearch) | contains(array_1, ‘test’) |
| ceil | number ceil(number $value) | ceil(num_1) |
| ends_with | boolean ends_with(string *subject*, *string* subject, stringprefix) | ends_with(str_1, ‘ing’) |
| floor | number floor(number $value) | floor(num_1) |
| join | string join(string *glue*, *array*\[*string*]glue, array\[string]stringsarray) | join(‘,’, array_1) |
| keys | array keys(object $obj) | keys(obj_1) |

© 2026 Ocient, Inc

| JMESPath Function | Function Signature | Example |
|---|---|---|
| length | number length(string\|array\|object $subject) | length(array_1) |
| map | array[any] map(expression→any→any expr, array[any] elements) | map(&to_string(@), array_1) |
| max | number max(array[number]\|array[string] $collection) | max(array_1) |
| max_by | max_by(array elements, expression→number\|expression→string expr) | max_by(array_1, &age) |
| merge | object merge([object *argument, [, object $…]]) | merge(obj_1, obj_2, obj_3) |
| min | number min(array[number]\|array[string] $collection) | min(array_1) |
| min_by | min_by(array elements, expression→number\|expression→string expr) | min_by(array_1, &age) |
| not_null | any not_null([any *argument*\[, *any*argument\[, any…]]) | not_null(val_1, val_2, val_3) |
| reverse | array reverse(string\|array $argument) | reverse(str_1) |
| sort | array sort(array[number]\|array[string] $list) | sort(array_1) |
| sort_by | sort_by(array elements, expression→number\|expression→string expr) | sort_by(array_1, &age) |
| starts_with | boolean starts_with(string *subject*, *string* subject, stringprefix) | starts_with(str_1, ‘chi’) |
| sum | number sum(array[number] $collection) | sum(array_1) |
| to_array | array to_array(any $arg) | to_array(val_1) |
| to_string | string to_string(any $arg) | to_string(val_1) |
| type | string type(array\|object\|string\|number\|boolean\|null $subject) | type(val_1) |
| values | array values(object $obj) | values(obj_1) |

# Other Transformation Functions

The following transformation functions are also available in LAT transformation expressions.

`add`

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

Returns the sum of the two arguments.

| | |
|---|---|
| **Signature:** | `number add(number $a, number $b)` |
| **Arguments:** | - `a` : first argument<br>- `b` : second argument |
| **Example:** | `add(int_col_0, int_col_1)` |

## `array_cap`

Caps the length of an array to a maximum number of elements.

| | |
|---|---|
| **Signature:** | `array array_cap(Array[any] $array_1, number $max_elements)` |
| **Arguments:** | - `array_1` : the array to cap<br>- `max_elements` : number of elements to cap the array at |
| **Example:** | `array_cap(array_1, 1000)` |

## `array_cat`

Concatenate two arrays, returning an array. Accepts an array or null value, returning an empty array if both parameters are null.

| | |
|---|---|
| **Signature:** | `array array_cap(array[any] $array_1, array[any] $array_2)` |
| **Arguments:** | - `array_1` : first array<br>- `array_2` : second array concatenated to first |
| **Example:** | `array_cat(array_1, array_2)` |

## `concat`

Concatenates two strings or converts arguments into strings and concatenates them into a string.

| | |
|---|---|
| **Signature:** | `string concat(any $a, any $b)` |
| **Arguments:** | - `a` : first argument (automatically converted to string when not specified as a string) |

| | |
|---|---|
| **Signature:** | `string concat(any $a, any $b)` |
| | - `b` : second argument (automatically converted to string when not specified as a string) |
| **Example:** | `concat("ocient", `10`)` |

## `divide`

Returns the floating-point division of the two arguments.

| | |
|---|---|
| **Signature:** | `number divide(number $a, number $b)` |
| **Arguments:** | - `a` : first argument<br>- `b` : second argument |
| **Example:** | `divide(int_col_0, int_col_1)` |

## `hash_code`

Returns an integer hash code for a string, number, or Boolean.

| | |
|---|---|
| **Signature:** | `number hash_code(string\|number\|boolean $val)` |
| **Arguments:** | `val` : the value to hash |
| **Example:** | `hash_code(null) → null`<br>`hash_code("Chicago") → -1884315574`<br>`hash_code("test123") → -1422501792`<br>`hash_code(`12345`) ->`<br>`12345` @@HTML_TABLE_TOKEN_3@@ `hash_code(`123.45`) ->`<br>`-1936584703` @@HTML_TABLE_TOKEN_4@@ `hash_code(`true`) ->`<br>`3` @@HTML_TABLE_TOKEN_5@@ `hash_code(`false`) -> 1` |

## `if`

Returns one of the other arguments based on the truth value of the first. When the first argument is true, return the second argument. When false, return the third.

> A NULL input into the first argument will be evaluated as false. Both branches are eagerly evaluated.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| | |
|---|---|
| **Signature:** | `any if(boolean $b, any $if_true, any $if_false)` |
| **Arguments:** | - `b` : boolean value that determines which of the options to return<br>- `if_true` : value returned if b is true<br>- `if_false` : value returned if b is false |
| **Example:** | `if(value > `5`, "North America", "Europe")` |

## `json`

Parses a string into a JSON value for use in further JMESPath operations. All values other than string are returned unmodified. Strings containing null, boolean, number, array, and object types are supported.

| | |
|---|---|
| **Signature:** | `object json(string $val)` |
| **Arguments:** | `val` : string to parse |
| **Example:** | `json("{ \"key\": 10 }")` |

## `lazy_if`

Returns one of the other arguments based on the truth value of the first. When the first argument is true, return the second argument. When false, return the third. The second and third arguments are both expressions. Branches are lazily evaluated.

| | |
|---|---|
| **Signature:** | `any lazy_if(boolean $b, expression $if_true, expression $if_false, any data)` |
| **Arguments:** | - `b` : boolean value that determines which of the options to return<br>- `if_true:` expression evaluated and returned if true<br>- `if_false` : expression evaluated and returned if false<br>- `data` : information used to evaluate either expression |
| **Example:** | `if(value > 5, &"North America", &abs(@), 1.0)` |

## `left`

Returns the `num_chars` leftmost characters of the string column. If null, null is returned. If the index is greater than the length of the string, the entire string is returned.

| | |
|---|---|
| **Signature:** | `string left(string $val, number $num_chars)` |
| **Arguments:** | - `a` : string column<br>- `num_chars` : number of chars to use from the left of a string column. |
| **Example:** | `left("ocient", '3')` |

## `lower_case`

Returns lower case version of a string.

| | |
|---|---|
| **Signature:** | `string lower_case(string $a)` |
| **Arguments:** | `a` : string to lower case |
| **Example:** | `lower_case("OCIENT")` |

## `lpad`

Pads an input string to a specified length with a padding string added to the left side.

| | |
|---|---|
| **Signature:** | `string lpad(string $val, number $length, string $padding)` |
| **Arguments:** | - `val` : the input string. This cannot be null.<br>- `length` : the length you want after padding. If the input string is longer than this length, it is truncated to length characters<br>- `padding` : the padding string. If no padding string is provided, the input string is padded with spaces. |
| **Example:** | `lpad(string_1, '3', '_')` |

## `ltrim`

Removes leading contiguous instances of a set of characters in a given string.

| | |
|---|---|
| **Signature:** | `string ltrim(string $val, string $strip_chars)` |
| **Arguments:** | - `val` : the input string to trim<br>- `strip_chars` : set of characters that should be removed (default is ' ' if the value is null or not specified) |
| **Example:** | `ltrim(null, ' ') → null`<br>`ltrim(' Chicago ') → 'Chicago '`<br>`ltrim(' Chicago ', ' ') → 'Chicago '` |

| | |
|---|---|
| **Signature:** | `string ltrim(string $val, string $strip_chars)` |
| | `ltrim(' Chicago ', null) -> 'Chicago '`<br>`ltrim('123test123', '321') -> 'test123'` |

### `map`

An override of JmesPath's built in map which maps a given expression into elements of an array. This override makes the small adjustment that if the array itself is null, then a null is returned.

| | |
|---|---|
| **Signature:** | `array map(expression $expr, array[any] array_1)` |
| **Arguments:** | - `expr` : expression the expression to map<br>- `array_1` : array[any] the array to which the expression will be mapped |
| **Example:** | `map(&if(@ == 1, true, false), [1,2,1,1,2]) -> [true, false, true, true, false]` |

### `matches`

Returns Boolean for whether this input matches the pattern.

Flags can be:

- `s` → Pattern.DOTALL
- `m` → Pattern.MULTILINE
- `i` → Pattern.CASE_INSENSITIVE
- `x` → Pattern.COMMENTS
- `q` → Pattern.LITERAL

| | |
|---|---|
| **Signature:** | `boolean matches(string $val, string $pattern, string $flags)` |
| **Arguments:** | - `val` : value to match<br>- `pattern` : regex to match against<br>- `args` : regex flags |
| **Example:** | `matches(col_1, ".*mytest.*", 'i')` |

### `millis_to_timestamp`

Converts an integer number of milliseconds since the Epoch to an Ocient timestamp column.

| | |
|---|---|
| **Signature:** | `number millis_to_timestamp(number $t)` |
| **Arguments:** | `t` : value to convert to an Ocient timestamp |
| **Example:** | `millis_to_timestamp(my_millis)` |

## `multiply`

Returns the floating-point multiplication of the two arguments.

| | |
|---|---|
| **Signature:** | `number multiply(number $a, number $b)` |
| **Arguments:** | - `a` : first argument<br>- `b` : second argument |
| **Example:** | `multiply(int_col_0, int_col_1)` |

## `nanos_to_timestamp`

Converts an integer number of nanoseconds since the Epoch to an Ocient timestamp column.

| | |
|---|---|
| **Signature:** | `number nanos_to_timestamp(number $t)` |
| **Arguments:** | - `t` : value to convert to an Ocient timestamp |
| **Example:** | `nanos_to_timestamp(my_nanosecs)` |

## `normalize_space`

Removes leading and trailing whitespace and replaces connected whitespace with a single space.

| | |
|---|---|
| **Signature:** | `string normalize_space(string $val)` |
| **Arguments:** | `val` : string to normalize |
| **Example:** | `normalize_space(col_1)` |

## `now, current_timestamp`

Returns the current timestamp in nanos. This will correctly load into an Ocient timestamp column

| | |
|---|---|
| **Signature:** | `number now() \| number current_timestamp()` |
| **Arguments:** | None |
| **Example:** | `now(), current_timestamp()` |

## `null_if, nullif`

Returns null if the first argument matches any of the following arguments. Can be applied to multiple columns or to compare a column with a constant. Can also be used with more than two arguments in which case returns null if a matches any of the subsequent arguments. Returns the value the first argument if it does not match any other arguments.

| | |
|---|---|
| **Signature:** | `any null_if(any $val, any $c0, [, any $…])` |
| **Arguments:** | - `val` : value to compare<br>- `c0` : required value to compare against<br>- `…` : optional multiple values to compare against |
| **Example:** | `null_if(col_a, "NULL", "NONE")` |

## `parse_array`

Given a string, parses it into an array of strings. Handles nested arrays as well.

| | |
|---|---|
| **Signature:** | `array parse_array(string $array_string, string $bracket_char, string $delim_char, int $dimensions)` |
| **Arguments:** | - `array_string` : the string of the array to be parsed<br>- `bracket_char` : the opening bracket character to use<br>- `delim_char` : the delimiter character to use<br>- `dimensions` : the dimension of this array |
| **Example:** | `parse_array("[ 1, 2, 3]", "[", ",", `1`) ⇒ [1, 2, 3]` @@HTML_TABLE_TOKEN_0@@ `parse_array("[[1,2],[3], []]", '[', ',', `2`) ⇒ [[1,2], [3], []]` @@HTML_TABLE_TOKEN_1@@ `parse_array("{ \"cat\", \"hat\" }", "{", ",", `1`) ⇒ ["cat", "hat"]` |

## `record_uuid`

Returns string that represents a unique identifier for the record in a given pipeline for a given file_group or topic. This return value will be consistent over multiple calls in the pipeline's transformation configuration for the same source record. Can be used as a surrogate key when loading multiple tables from the same source record in a pipeline to facilitate joins when no unique identifier exists on the source record.

| | |
|---|---|
| **Signature:** | `string record_uuid()` |
| **Arguments:** | None |
| **Example:** | `record_uuid() -> "6064fc40-9961-4f5e-b74d-090458e4a609"` |

## `replace`

Returns string with text matching the regex pattern replaced by the replacement text.

Flags can be:

- `s` → Pattern.DOTALL
- `m` → Pattern.MULTILINE
- `i` → Pattern.CASE_INSENSITIVE
- `x` → Pattern.COMMENTS
- `q` → Pattern.LITERAL

| | |
|---|---|
| **Signature:** | `string replace(string $val, string $pattern, string $replacement_text, string $flags)` |
| **Arguments:** | - `val` : value to search for replacement<br>- `pattern` : section to replace<br>- `replacement_text` : replacement string<br>- `args` : regex flags |
| **Example:** | `replace(col_1, '[oO]ld', 'new', 'q')` |

## `right`

Returns the `num_chars` rightmost characters of the string column. If null, null is returned. If the index is greater than the length of the string, the entire string is returned.

| | |
|---|---|
| **Signature:** | `string right(string $a, number $num_chars)` |
| **Arguments:** | - `a` : string column<br>- `num_chars` : number of chars to use from the right of a string column. |
| **Example:** | `right("ocient", '3')` |

## `rpad`

Pads an input string to a specified length with a padding string added to the right side.

| | |
|---|---|
| **Signature:** | `string rpad(string $val, number $length, string $padding)` |
| **Arguments:** | - `val` : the input string. This cannot be null.<br>- `length` : the length you want after padding. If the input string is longer than this length, it is truncated to length characters<br>- `padding` : the padding string. If no padding string is provided, the input string is padded with spaces. |
| **Example:** | `rpad(string_1, '3', '_')` |

## `rtrim`

Removes trailing contiguous instances of a set of characters in a given string.

| | |
|---|---|
| **Signature:** | `string rtrim(string $val, string $strip_chars)` |
| **Arguments:** | - `val` : the input string to trim<br>- `strip_chars` : set of characters that should be removed (default is ' ' if the value is null or not specified) |
| **Example:** | `rtrim(null, ' ') → null`<br>`rtrim(' Chicago ') → ' Chicago'`<br>`rtrim(' Chicago ', ' ') → ' Chicago'`<br>`rtrim(' Chicago ', null) → ' Chicago'`<br>`rtrim('123test123', '321') → '123test'` |

## `sample`

Returns true or false based on the given sample rate. The sample rate must be a number. Commonly used inside of `IF` statements. An exception will be thrown if the sample rate is outside of [0.0, 1.0].

| | |
|---|---|
| **Signature:** | `boolean sample(number $rate)` |
| **Arguments:** | `rate` : rate to return true. Must be between [0.0, 1.0]. |
| **Example:** | `sample(`0.5`)` |

## st_forcepolygonccw

Forces a polygon to have a counterclockwise rotation of the outer polygon ring and a clockwise rotation of the inner polygon ring. You can use this function to convert polygons extracted from systems that interpret polygon rotation differently.

| | |
|---|---|
| **Signature:** | `geometry st_forcepolygonccw(string $wkt_geometry)` |
| **Arguments:** | `wkt_geometry` : WKT string representing the polygon to rotate. Also accepts WKT of POINT or LINESTRING and returns those types unmodified. |
| **Example:** | `st_forcepolygonccw('POLYGON(…)')` |

## st_geomfromewkb

Returns a geometry from an Extended Well-Known Binary (EWKB) and Well-Known Binary (WKB) representations of a geometry. You can load the result of this function into POINT, LINESTRING, and POLYGON column types.

| | |
|---|---|
| **Signature:** | `geometry st_geomfromewkb(string ewkb)` |
| **Arguments:** | `wkb` : hex encoded string Extended WKB or WKB representation of a geometry. EWKB or WKB can be standalone hexadecimal characters or can be prefixed with either 0x or \x. |
| **Example:** | `st_geomfromewkb('0103…')`<br>`st_geomfromewkb('0x0103…')`<br>`st_geomfromewkb('\x0103…')` |

## st_point

Constructs an POINT from numeric coordinates that represent the longitude and latitude of the point.

| | |
|---|---|
| **Signature:** | `geometry st_point(float longitude, float latitude)` |
| **Arguments:** | - `longitude` : floating point longitude of the point to construct<br>- `latitude` : floating point latitude of the point to construct |
| **Example:** | `st_point(float_col_1, float_col_2)` |

## `substring`

Returns the substring beginning at `start_index` (with indexes beginning at 1) to the end of the string, or to `num_chars` characters.

| | |
|---|---|
| **Signature:** | `string substring(string $val, number $start_index, [number $num_chars])` |
| **Arguments:** | `val` : string to substring<br>`start_index` : index to start at. First character is index 1.<br>`num_chars` : optional. The maximum number of chars to return |
| **Example:** | `substring(str_col, 10)` @@HTML_TABLE_TOKEN_0@@ `substring(str_col, 10, 5)` @@HTML_TABLE_TOKEN_1@@ `substring('Chicago Bears', 3) → 'icago Bears'` @@HTML_TABLE_TOKEN_2@@ `substring('Chicago Bears', 3, 4) → 'icag'` |

## `substring_after`

Returns the string after the first occurrence of the needle.

| | |
|---|---|
| **Signature:** | `string substring_after(string $val, string $needle)` |
| **Arguments:** | - `val` : string to substring<br>- `needle` : delimiter to use to designate where to return subsequent substring. |
| **Example:** | `substring_after('my_text', '_') → 'text'` |

## `substring_before`

Returns the string before the first occurrence of the needle. Both parameters are literal strings.

| | |
|---|---|
| **Signature:** | `string substring_before(string $val, string $needle)` |
| **Arguments:** | - `val` : string to substring<br>- `needle` : delimiter to use to designate where to return prior substring. |
| **Example:** | `substring_before('my_text', '_') → 'my'` |

## `subtract`

Returns the difference of the two arguments.

| | |
|---|---|
| **Signature:** | `number subtract(number $a, number $b)` |
| **Arguments:** | - `a` : first argument<br>- `b` : second argument |
| **Example:** | `subtract(int_col_0, int_col_1)` |

## `to_array_length`

Turns any JSON object into an array with N copies of that object.

| | |
|---|---|
| **Signature:** | `array[any] to_array_length(any $val, number $n)` |
| **Arguments:** | - `val` : value to copy into an array<br>- `n` : number of copies to make |
| **Example:** | `to_array_length(value_col, `3`)` |

## `to_binary`

Converts a string to binary data for loading into an Ocient binary or hash column.

If `mode` is `'hex'`, `data` is parsed as a sequence of hexadecimal digits. Note that the sequence of digits must not begin with `0x`.

Otherwise, `mode` must be the name of a character encodings listed **here**, and `data` is encoded in that encoding.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| | |
|---|---|
| **Signature:** | `binary to_binary(string $data, string $mode)` |
| **Arguments:** | - `data` : data to convert to binary<br>- `mode` : either ‘hex’ or the name of a standard Java® character encoding |
| **Example:** | `to_binary(str_col, 'utf-16')` |

## `to_date`

Converts a string to a date for loading into an Ocient date column. Format string follows these **formatting rules**.

| | |
|---|---|
| **Signature:** | `number to_date(string $date, string $format_string)` |
| **Arguments:** | - `date` : date string to convert<br>- `format_string` : format string to use for conversion |
| **Example:** | `to_date(str_col, 'yyyy-MM-dd')` |

## `to_time`

Converts a string into a time of day for loading into an Ocient time column. Format string follows these **formatting rules**.

| | |
|---|---|
| **Signature:** | `number to_time(string $time, string $format_string)` |
| **Arguments:** | - `time` : time string to convert<br>- `format_string` : format string to use for conversion |
| **Example:** | `to_time(str_col, 'HH:mm:ss.nnnnnnnnn')` |

## `to_timestamp`

Converts a string to timestamp for loading into an Ocient timestamp column. Format string follows these **formatting rules**.

| | |
|---|---|
| **Signature:** | `number to_timestamp(string $timestamp, string $format_string)` |
| **Arguments:** | - `timestamp` : timestamp string to convert<br>- `format_string` : format string to use for conversion |
| **Example:** | `to_timestamp(str_col, 'yyyy-MM-dd HH:mm:ss.SSS')` |

## `to_tuple`

Works on tuples that get tokenized at the first nesting level by a given delimiter. Nested tuples, arrays or objects are considered entirely. For each tokenized tuple element, a transformation function can be specified that is applied to the tuple element. Tokenized elements are always treated as strings, requiring additional transformation when being treated as numbers.

| | |
|---|---|
| **Signature:** | `array to_tuple(string $tuple_string, string $bracket_char, string $delim_char [, expression $transformation_function …])` |
| **Arguments:** | - `tuple_string` : the string of the tuple to be parsed.<br>Must be encapsulated in the given bracket character and its closing peer. Empty tuple values are treated as null values.<br>If the whole argument is NULL, the function returns NULL ignoring all given expressions in transformation_function…<br>- `bracket_char` : the bracket character to use for parsing and result generation<br>- `delim_char` : the delimiter character to use for parsing and result generation.<br><br>The supported delimiters are: ’(’, ’[’ and ’{’<br><br>- `avg(…)`<br>- `keys(…)`<br>- `map(…)`<br>- `sum(…)`<br>- `value(…)`<br>- `type(…) - partially for boolean and object types` |
| **Example:** | - `to_tuple((-1,2), '(', ',', &abs(to_number(@)), &@) → '(1.0,2)'`<br>- `to_tuple((,'8',2), '(', ',', &if(@ != null, @, 'missing'), &if(length(@) > 0, @, 'missing'), &to_number(@) ) → '("missing","'8'",2)'` |

## `tokenize`

Returns array of strings after splitting on the regex pattern.

Flags can be:

- `s` → Pattern.DOTALL
- `m` → Pattern.MULTILINE
- `i` → Pattern.CASE_INSENSITIVE
- `x` → Pattern.COMMENTS
- `q` → Pattern.LITERAL

| | |
|---|---|
| **Signature:** | `array[string] tokenize(string $val, string $pattern, string $flags)` |
| **Arguments:** | - `val` : string to tokenize<br>- `pattern` : token regex pattern<br>- `flags` : regex flags |
| **Example:** | `tokenize(col_1, ''), 'i ')` |

## `translate`

Replaces characters according to a map of characters. If the to_chars string is shorter than the from_chars string, the function removes the characters that are not mapped.

| | |
|---|---|
| **Signature:** | `string translate(string $val, string $from_chars, string $to_chars)` |
| **Arguments:** | - `val` : string to translate<br>- `from_char` : from character map<br>- `to_chars` : to character map |
| **Example:** | `translate('Lorem Ipsum', 'mnop', '1234') -> 'L3re1 I4su1'` |

## `trim`

Removes leading and trailing contiguous instances of a set of characters in a given string.

| | |
|---|---|
| **Signature:** | `string trim(string $val, string $strip_chars)` |
| **Arguments:** | - `val` : the input string to trim<br>- `strip_chars` : set of characters that should be removed (default is ' ' if the value is null or not specified) |
| **Example:** | `trim(null, ' ') → null`<br>`trim(' Chicago ') → 'Chicago'`<br>`trim(' Chicago ', ' ') → 'Chicago'`<br>`trim(' Chicago ', null) → 'Chicago'`<br>`trim('123test123', '321') → 'test'` |

## `truncate`

Truncates a decimal number to have a specified number of digits after its decimal point.

If `decimal` is null, this function returns null.

> ⚠ During the transformation stage, the LAT stores numbers as integers or floating point numbers by default. However, floating point numbers are inexact. For this reason, this function might return unexpected results. For example, `truncate(`0.29`, `2`)` evaluates to `0.28`, not `0.29` (because `0.29` is really `0.28999999...`).

| | |
|---|---|
| **Signature:** | `number truncate(number $decimal, number $decimal_places)` |
| **Arguments:** | - `decimal` : the number to truncate<br>- `decimal_places` : the number of digits to keep after the decimal point |
| **Example:** | `truncate(decimal_col, `2`)` |

## `tuple_element_transformation`

Works on an element of a given array and applies the specified expression to that element. The function returns an array or null if specified.

| | |
|---|---|
| **Signature:** | `array tuple_element_transformation(array $array_values, number $array_index, expression $transformation_function)` |
| **Arguments:** | - `array_values` : an array of values.<br>If the whole argument is NULL, the function returns NULL.<br>- `array_index` : a number pointing to an element in the array. The first index of the array is 0<br>- `transformation_function` : a transformation functions to apply to array element specified by array_index. |

| | |
|---|---|
| **Signature:** | `array tuple_element_transformation(array $array_values, number $array_index, expression $transformation_function)` |
| **Example:** | `tuple_element_transformation([-1.0,2,3, '0', abs(@)) -> [1.0,2,3] ]` |

## `unique`

Return all unique values in an array.

| | |
|---|---|
| **Signature:** | `array[any] unique(array[any] $vals)` |
| **Arguments:** | `vals` : array to return unique values from, removing all duplicates. |
| **Example:** | `unique(vals_col)` |

## `upper_case`

Returns upper case version of string.

| | |
|---|---|
| **Signature:** | `string upper_case(string $a)` |
| **Arguments:** | `a` : string to upper case |
| **Example:** | `upper_case("ocient")` |

## `width_bucket`

Returns the bucket number of the queried value in a histogram starting at min, ending at max, and consisting of num_buckets count of buckets.

- The values are inclusive on the lower bound and exclusive of the upper bound so that all buckets are the same width.
- Also note that requesting 100 buckets will actually get you 102 possible buckets. Bucket 0 through 101. Where 0 captures all values below the minimum and 101 captures all values at the maximum and beyond.

| | |
|---|---|
| **Signature:** | `number width_bucket(number $val, number $min, number max, number $num_buckets)` |
| **Arguments:** | - `val` : value to determine the bucket number for<br>- `min` : min value of histogram |

| | |
|---|---|
| **Signature:** | `number width_bucket(number $val, number $min, number max, number $num_buckets)` |
| | - `max` : max value of histogram<br>- `num_buckets` : number of buckets in histogram |
| **Example:** | `width_bucket(my_col, '0', '100', '20')` |

### `zip`

Zips N one-dimensional arrays into a single two-dimensional array with each inner array containing N elements.

The resulting outer array will have a length equal to the max length of any input array. For input arrays smaller than the max length, null elements will be placed in the inner arrays.

| | |
|---|---|
| **Signature:** | `array[any] zip(array[any] $a0, array[any] $a1, [, array[any] $…])` |
| **Arguments:** | - `a0` : array to zip<br>- `a1` : array to zip<br>- `…` : Optional additional arrays to zip |
| **Example:** | `zip(array_col0, array_col1, array_col2)` |

# Special Functions

## EXPLODE

Performs an explosion on all indicated columns, producing one row per value in the exploded array. This can be applied to multiple columns in the same table. Non-exploded columns are held constant and exploded columns are zipped together in array order. If multiple exploded columns have different array lengths, the record is exploded into N records where N is the max length. Columns with array lengths less than N will have `null` values after each of their values are exploded.

You can explode a maximum of 8,192 array elements for each source record.

## Usage

`EXPLODE(array[any] arr)` can be used like any other JMESPath function on a JSON Array type with a few limitations:

- `EXPLODE` can only be used as the outermost function in a JMESPath expression
- `EXPLODE` only works on a single dimension. Multidimensional explode is not supported.

## Examples

### Single-Column EXPLODE

Transform Configuration:

JSON

```
{
    "transform": {
        "topics" : {
            "topic0" : {
                "tables" : {
                    "table0" : {
                        "columns" {
                            "col0": "EXPLODE(array0)",
                            "col1": "integer0"
                        }
                    }
                }
            }
        }
    }
}
```

Input:

JSON

```
{
    "array0": [0, 1, 2, 3],
    "integer0": 4
}
```

Output:

JSON

```
[
    {
        "col0": 0,
        "col1": 4
    },
    {
        "col0": 1,
        "col1": 4
    },
    {
        "col0": 2,
        "col1": 4
    },
    {
        "col0": 3,
        "col1": 4
    }
]
```

**Multi-Column EXPLODE**

Transform Configuration:

JSON

```
{
    "transform": {
        "topics" : {
            "topic0" : {
                "tables" : {
                    "table0" : {
                        "columns" : {
                            "col0": "EXPLODE(array0)",
                            "col1": "EXPLODE(array1)",
                            "col2": "integer0"
                        }
                    }
                }
            }
        }
    }
}
```

Input:

JSON

```
{
    "array0": [0, 1, 2, 3],
    "array1": [0, 1, 2],
    "integer0": 4
}
```

Output:

JSON

```
[
    {
        "col0": 0,
        "col1": 0,
        "col2": 4
    },
    {
        "col0": 1,
        "col1": 1,
        "col2": 4
    },
    {
        "col0": 2,
        "col1": 2,
        "col2": 4
    },
    {
        "col0": 3,
        "col1": null,
        "col2": 4
    }
]
```

Note that in the 4th record `col1` has a `null` value because `array1` only has three values while `array0` has four.

# LAT User-Defined Transformations

(deprecated) Define custom transformations in Ocient LAT pipelines using Groovy or Java to apply project-specific business logic when reshaping incoming data records.

⚠ Data Pipelines are now the preferred method for loading data into the Ocient® System. For details, see **Load Data**. The LAT loading functionality will be removed in version 29.0.

In addition to built-in transformations, users can extend LAT by writing custom user-defined transformations (UDTs).

ⓘ To bootstrap UDT development, contact Ocient Support.

## UDT Interface

A UDT is implemented as a **JMESPath Java Function**. A Function is comprised of three elements:

1. **name** - the function's name determines how it can be called in a user pipeline e.g., `negate`
2. **arguments** - what inputs the function expects to be called with
3. **body** - the function's implementation, including return value

UDT names must be globally unique. LAT validates UDT names on startup to ensure that no two UDT names collide with each other and that no UDT name collides with an LAT builtin transformation.

This example function demonstrates these concepts:

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

Java

```java
// negate(number) - takes an input number and changes its sign
// function name - derived from the class name, NegateFunction -> negate
public class NegateFunction extends BaseFunction {
    public NegateFunction() {
        super(
            // function arguments; this function takes exactly one argument of ty
            ArgumentConstraints.typeOf(JmesPathType.NUMBER));
      }

    // function body
    protected <T> T callFunction(Adapter<T> runtime, List<FunctionArgument<T>> ar
        double original = runtime.toNumber(arguments.get(0).value()).doubleValue(
        return runtime.createNumber(original * -1);
    }
}
```

## UDT Packaging

One or more UDTs can be packaged in a jar file for consumption by LAT. In addition to the UDT implementations themselves, the jar file must contain a services file containing a mapping of all the UDTs the jar should expose for use by LAT. This service file must be located at `META-INF/services/io.burt.jmespath.function.Function` in the resulting jar, and its contents should be as follows:

Text

```
com.ocient.myudt.NegateFunction
```

ⓘ The file at the path `META-INF/services/io.burt.jmespath.function.Function` should include the fully qualified name of one or more UDTs contained within this jar to be used by LAT. Each UDT should be specified on its own line in the file.

## Dependencies

If the UDT has dependencies on third party libraries, those libraries must be packaged in the same jar file. This is commonly referred to as a “fat jar”, “uber jar”, or “jar with

dependencies.” Instructions for building such a jar file with Maven™ can be found **here**.

## UDT Deployment

LAT can be configured to search for UDT jars in a particular directory. See **LAT Source Configuration** for details. LAT can read multiple UDTs across multiple jar files.

On startup, LAT will read all available UDTs into its configuration. To update the set of UDTs available to LAT, such as to add an additional UDT jar, a process restart is required.

# LAT Record Filtering

(deprecated) Filter records in Ocient LAT pipelines using expression-based rules to drop, route, or accept incoming records before they reach transformation and load stages.

> ⚠ Data Pipelines are now the preferred method for loading data into the Ocient® System. For details, see **Load Data**. The LAT loading functionality will be removed in version 29.0.

Incoming records can optionally be filtered by a JMESPath expression added with an additional filter key in a pipeline configuration.

JSON

```
{
    "transform": {
        "topics": {
            "my_topic": {
                "filter": "<jmespath-expression>",
                "tables": {
                    "my_table": {
                        "filter": "<jmespath-expression>",
                        "columns": {}
                    }
                }
            }
        }
    }
}
```

Records that pass through the filter (the filter expression evaluates to true) are processed as normal, while records that fail the filter (the filter expression evaluates to false) are dropped. Note that filters can be applied at the topic or table levels. A record needs to pass through all configured filters in order to be loaded to a table.

The filter JMESPath expression must evaluate to a `boolean` value. Examples of this are JMESPath comparators or functions that return a `boolean` like `contains`,

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

`starts_with`, and `ends_with`.

## Example

Pipeline:

JSON

```
{
    "transform": {
        "topics": {
            "topic0": {
                "filter": "integer0 == `2`",
                "tables": {
                    "table0": {
                        "filter": "integer1 == `3`",
                        "columns": {
                            "col0": "integer0",
                            "col1": "integer1"
                        }
                    }
                }
            }
        }
    }
}
```

Input:

JSON

```
[
    {
        "integer0": 0,
        "integer1": 3
    },
    {
        "integer0": 2,
        "integer1": 1
    },
    {
        "integer0": 2,
        "integer1": 3
    }
]
```

Output:

JSON

```
[
    {
        "integer0": 2,
        "integer1": 3
    }
]
```

# LAT Service Configuration

(deprecated) Configure the Ocient LAT service, including JVM options, threading, resource allocation, ports, and other parameters that affect pipeline runtime behavior.

> ⚠ Data Pipelines are now the preferred method for loading data into the Ocient® System. For details, see **Load Data**. The LAT loading functionality will be removed in version 29.0.

The LAT service is configurable using Service Configuration.

This configuration is derived from three sources, with the following precedence order:

1. Environment Variables
2. Properties File
3. Code Defaults

## Configuration File Backup

When you install a new LAT instance or upgrade the existing instance, LAT creates a backup file of the `/etc/lat/lat.conf` as `/etc/lat/override.conf` and creates a new version of the `/etc/lat/lat.conf` file. The `/etc/lat/overrirde.conf` file does not control the LAT configuration. If you made prior changes to `lat.conf`, you must review `override.conf` and add any custom values into the revised `lat.conf`.

## Environment Variables

### `LAT_DEFAULT_WORKERS`

Default number of workers used by a newly configured pipeline.

| **Environment Variable:** | **LAT_DEFAULT_WORKERS** |
|---|---|
| **Property**: | lat.default.workers |
| **Default**: | Server core count |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

### `LAT_SHUTDOWN_DURATION`

Duration, in milliseconds, to wait prior to termination on shutdown.

| **Environment Variable:** | **LAT_SHUTDOWN_DURATION** |
|---|---|
| **Property**: | lat.shutdown.duration |
| **Default**: | 120000 |

### `LAT_UDT_PATH`

Directory containing zero or more user defined transformation (UDT) jars. Ensure that the specified path can be accessed by the LAT (e.g., CentOS® does not allow the LAT to access the home directory of an administrative user).

| **Environment Variable:** | **LAT_UDT_PATH** |
|---|---|
| **Property**: | lat.udt.path |
| **Default**: | null |

### `LAT_API_PORT`

REST API and Metrics port.

| **Environment Variable:** | **LAT_API_PORT** |
|---|---|
| **Property**: | lat.api.port |
| **Default**: | 8080 |

### `LAT_DATA_PATH`

Path to the LAT data directory. This directory is used to store persistent data related to pipelines ( `pipeline/` ) and sinks ( `sink/` ). In almost all cases, using the **LAT Client Command Line Interface** is preferred over editing the files in this directory manually. Ensure that the specified path can be accessed by the LAT (e.g., CentOS does not allow the LAT to access the home directory of an administrative user).

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Environment Variable: | LAT_DATA_PATH |
| --- | --- |
| **Property**: | lat.data.path |
| **Default**: | .lat-data |

### `LAT_AUTO_START`

On LAT startup, automatically starts running a Pipeline if one is present. This only supports pipelines with Apache® Kafka® sources; File sources will not automatically start even if this configuration is set to `true`.

| Environment Variable: | LAT_AUTO_START |
| --- | --- |
| **Property**: | lat.auto.start |
| **Default**: | false |

### `LAT_ALLOW_LOG_ORIGINAL_RECORDS`

Allow the original records that are being loaded to be logged when errors occur. This setting must be enabled for `log_original_records` to be enabled.

This setting only affects pipelines that log errors to the error log file.

| Environment Variable: | LAT_ALLOW_LOG_ORIGINAL_RECORDS |
| --- | --- |
| **Property**: | lat.allow.log.original.records |
| **Default**: | false |

### `LAT_MAX_RETRIEVABLE_ERRORS`

A limit on the number of errors that you can retrieve using the `pipeline errors` command of the LAT client.

| Environment Variable: | LAT_MAX_RETRIEVABLE_ERRORS |
| --- | --- |
| **Property**: | lat.max.retrievable.errors |
| **Default**: | 1000 |

### `LAT_API_PROXY_HOST`

API proxy host for OKTA® authorization requests.

| Environment Variable: | LAT_API_PROXY_HOST |
| --- | --- |
| **Property**: | lat.api.proxy.host |
| **Default**: | null |

### `LAT_API_PROXY_PORT`

API proxy port for Okta authorization requests.

| Environment Variable: | LAT_API_PROXY_PORT |
| --- | --- |
| **Property**: | lat.api.proxy.PORT |
| **Default**: | null |

### `LAT_API_OAUTH_DOMAIN`

Okta authorization domain.

| Environment Variable: | LAT_API_OAUTH_DOMAIN |
| --- | --- |
| **Property**: | lat.api.oauth.domain |
| **Default**: | null |

### `LAT_API_OAUTH_ENDPOINTS`

A list of LAT API endpoints that Okta should apply authentication on. To override, provide a comma-delimited list, e.g., `/endpoint1,/endpoint2,/endpoint3`.

| Environment Variable: | LAT_API_OAUTH_ENDPOINTS |
| --- | --- |
| **Property**: | lat.api.oauth.endpoints |
| **Default**: | null |

### `LAT_API_OAUTH_SERVER`

Okta authorization server.

| Environment Variable: | LAT_API_OAUTH_SERVER |
| --- | --- |
| **Property**: | lat.api.oauth.server |
| **Default**: | null |

### `LAT_API_CERT_PATH`

API cert file path. Ensure that the specified path can be accessed by the LAT (e.g., CentOS does not allow the LAT to access the home directory of an administrative user).

| Environment Variable: | LAT_API_CERT_PATH |
| --- | --- |
| **Property**: | lat.api.cert.path |
| **Default**: | null |

### `LAT_DNS_CACHE_TTL`

The time-to-live (TTL) in seconds that the LAT should use for its DNS cache. This configuration is only supported as an Environment Variable or as Default.

| Environment Variable: | LAT_DNS_CACHE_TTL |
| --- | --- |
| **Property**: | N/A |
| **Default**: | 30 |

### `LAT_MEMORY`

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

Maximum JVM® heap memory. This configuration is only supported as an Environment Variable or as Default when running the LAT through the provided package service file or through the provided `lat.sh` script. If directly running the Jar JVM heap memory should be set through command line arguments.

| **Environment Variable:** | **LAT_MEMORY** |
|---|---|
| **Property**: | N/A |
| **Default**: | 32G |

### `LAT_MEMORY_DIRECT`

Maximum JVM direct memory. This configuration is only supported as an Environment Variable or as Default when running the LAT through the provided package service file or through the provided `lat.sh` script. If directly running the Jar JVM heap memory should be set through command line arguments.

| **Environment Variable:** | **LAT_MEMORY_DIRECT** |
|---|---|
| **Property**: | N/A |
| **Default**: | 32G |

## Override Environment Variables

The recommended way to manage the production service configuration when LAT is running as a daemon is using environment variables or the `/etc/systemd/system/lat.service.d/override.conf` file.

To override LAT environment variables as a `systemd` service, there are two recommended commands that edit the `etc/systemd/system/lat.service.d/override.conf` file.

1. Run `sudo vim etc/systemd/system/lat.service.d/override.conf` or `sudo systemctl edit lat`.
2. Insert the environment variables to override in the file. Save and exit the editor.

**Configuration File Example:**

Shell

```
[Service]
Environment=LAT_MEMORY_DIRECT=200G
Environment=LAT_MEMORY=200G
```

# LAT Metrics

(deprecated) Track Ocient LAT pipeline metrics such as record counts, throughput, errors, and latency to monitor data loading performance and detect issues quickly.

⚠ Data Pipelines are now the preferred method for loading data into the Ocient® System. For details, see **Load Data**. The LAT loading functionality will be removed in version 29.0.

## Configuration

LAT metrics are exposed using the LAT REST API.

## Endpoints

LAT exposes two metrics endpoints; a ***partitions*** endpoint, and a ***pipeline*** endpoint.

### Partition Metrics

The partitions endpoint exposes individual metrics for every partition that is participating in the current LAT instance. For Apache® Kafka® loads, partitions correspond to Kafka's partitions. For File Source based loads, partitions correspond to the independent file sets created within each File Group for parallel processing.

The partitions metrics endpoint can be accessed by issuing a curl request as follows:

CURL

```
curl http://127.0.0.1:8080/v2/metrics/read/lat:type=partitions
```

A response for this request will look as follows, with one entry per partition in the partitions array:

© 2026 Ocient, Inc

JSON

```

## Partition Metrics Definitions

Metrics definitions are as follows:

| Metric | Description |
|---|---|
| `partition` | Topic partition pair (e.g., `mytopic-0`) |
| `records_errors_deserialization` | Total number of processed records which failed to deserialize |
| `records_errors_transformation` | Total number of processed records which failed to transform |
| `records_errors_column` | Total number of processed records which failed to bind transformed values to columns |
| `records_errors_row` | Total number of processed records which failed during builder row advancement/other builder errors |
| `records_errors_generic` | Total number of processed records which failed for any other reason |
| `records_errors_total` | Sum of all record errors for this topic |
| `records_buffered` | Total number of processed records which have not yet been pushed. Should always be modulo configured buffer size |
| `records_filter_rejected` | Number of records rejected by the topic filter. |
| `records_filter_accepted` | Number of records accepted by the topic filter. |
| `offsets_processed` | For Kafka loading, records are processed if their offsets are strictly less than the value of `offsets_processed`.<br><br>For file loading, this represents the index of the most recently processed file.<br><br>If there is an error during the processing of a record/file, this metric is still updated according to that record/file's offset. When a file load is complete, this offset becomes equal to offsets_end. Can decrease due to reprocessing. |
| `offsets_written` | For Kafka loading, records are written if their offsets are strictly less than the value of offsets_written.<br><br>For file loading, this represents the index of the most recently written file.<br><br>This metric is only updated when the record/file is processed and the write is successful. Note that a successful write does not mean the record/file is durable. Can decrease due to reprocessing. |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Metric | Description |
| --- | --- |
| `offsets_buffered` | For Kafka loading, this represents the most recently processed record which was processed to completion and is waiting to be pushed into the OcientAIQ™ Unified Data Platform.<br><br>For file loading, this represents the index of the most recently processed file which was processed to completion and is waiting to be pushed into the Ocient data warehouse. |
| `offsets_pushed` | For Kafka loading, this represents the highest offset of the batch of rows most recently pushed to the Ocient data warehouse.<br><br>For file loading, this represents the highest file index of the batch of rows most recently pushed to the Ocient data warehouse.<br><br>Can decrease due to reprocessing. |
| `offsets_end` | For Kafka loading, this represents the end offset of the partition.<br><br>For file loading, this represents the file count of the partition.<br>Should never decrease. |
| `offsets_durable` | For Kafka loading, records are made durable if their offsets are strictly less than the value of offsets_durable.<br><br>For file loading, this represents the most durable file index.<br>Should never decrease. |
| `producer_send_attempts` | Number of Kafka error topic producer send attempts |
| `producer_send_errors` | Number of Kafka error topic producer send errors |
| `bytes_pushed` | Number of bytes pushed into the Ocient data warehouse |
| `rows_pushed` | Number of rows pushed into the Ocient data warehouse |
| `pushes_attempts` | Number of attempts to push record batches into the Ocient data warehouse for this partition |
| `pushes_errors` | Number of attempts to push record batches into the Ocient data warehouse which resulted in error |
| `pushes_unacknowledged` | Number of attempts to push record batches into the Ocient data warehouse for which no response has yet been received |
| `invalid_state` | Number of times a code path was reached in LAT which is erroneous |
| `complete` | Whether or not the partition has any records left to process at the moment; this status can change often in a Kafka load but will likely not change from complete to incomplete in a file load |
| `errors_partition` | The number of times the LAT failed to fetch records for a particular partition |

| Metric | Description |
| --- | --- |
| `lag` | Calculated as offsets_end - offsets_durable; In a Kafka load, lag represents the number of unprocessed records. In a file load, lag represents the number of unprocessed files.<br><br>Lag becomes zero when the complete status is true. |

## Pipeline Metrics

The pipeline endpoint exposes aggregate metrics for the LAT instance. There are three categories of pipeline metrics:

| Pipeline Metric Category | Description |
| --- | --- |
| `"pipeline" aggregate` | Monotonically-increasing metrics that act as lifetime counters for the running pipeline. They are independent of the current set of partitions. For instance, `rows_pushed` is the total number of rows ever pushed for this pipeline. |
| `"partitions" aggregate` | Metrics that depend on the current set of active partitions for the running pipeline. For instance, `total_lag` is the summed lag across all currently active partitions for the pipeline. |
| `pipeline-specific` | Pipeline only metrics that are not aggregates. |

The Pipeline Metrics endpoint can be accessed by issuing a curl request as follows:

Shell

```
curl http://127.0.0.1:8080/v2/metrics/read/lat:type=pipeline
```

A response for this request will look as follows:

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

JSON

```
{
    "request": {
        "mbean": "lat:type=pipeline",
        "type": "read"
    },
    "value": {
        "pipeline": {
            "pushes_errors": 0,
            "pushes_attempts": 0,
            "rows_pushed": 0,
            "records_errors_column": 0,
            "records_errors_deserialization": 0,
            "records_errors_transformation": 0,
            "bytes_pushed": 0,
            "errors_partition": 0,
            "records_filter_accepted": 0,
            "records_errors_total": 0,
            "records_errors_row": 0,
            "records_filter_rejected": 0,
            "records_errors_generic": 0,
            "producer_send_attempts": 0,
            "producer_send_errors": 0
        },
        "partitions": {
            "max_lag": 0,
            "total_offsets_buffered": 0,
            "avg_lag": 0.0,
            "total_pushes_unacknowledged": 0,
            "min_lag": 0,
            "total_lag": 0,
            "total_invalid_state": 0,
            "total_offsets_pushed": 0,
            "total_records_buffered": 0,
            "total_complete": 0,
            "total_offsets_processed": 0
        },
        "paused": 0,
        "bytes_buffered": 0,
        "complete": 0,
        "workers": 32,
        "lat_version": "3.0.0"
    },
```

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

```
    "timestamp": 1642497956,
    "status": 200
}
```

Individual metrics such as `lag`, `offsets_buffered`, `pushes_errors`, etc. are defined within the **Partition Metrics Definitions** section.

However, metrics specific *only* to the pipeline endpoint are defined as follows:

| Metric | Description |
|---|---|
| `paused` | 0 if processing is active across all workers, 1 otherwise. |
| `bytes_buffered` | Global allocated memory in bytes. |
| `complete` | 1 if the pipeline has finished the entire loading process, 0 otherwise. |
| `workers` | The number of active workers. |
| `lat_version` | The version of the running LAT server. |

# LAT Log4J Configuration

(deprecated) Configure Log4j logging for the Ocient Loading and Transformation (LAT) system to control log levels, appenders, and rotation for troubleshooting and audit.

> ⚠ Data Pipelines are now the preferred method for loading data into the Ocient® System. For details, see **Load Data**. The LAT loading functionality will be removed in version 29.0.

The LAT uses Apache® Log4J 2™ for **logging**. Users can configure their logging setup however they would like. The LAT packages come with example `log4j2.xml` files that can be used directly, or modified by the user. This XML code in the `log4j2.xml` file shows an example configuration.

      <Field name="thread" pattern="%t" />
    </Gelf>
    -->
  </Appenders>
  <Loggers>
    <Logger name="org.apache.kafka" level="info" />
    <Logger name="com.ocient.lat.sink.ocient.Binders.Binder" level="info" />
    <!-- HttpChannel at debug so that jetty preserves the stacktrace when logging
    <Logger name="org.eclipse.jetty.server.HttpChannel" level="debug" />
    <Logger name="org.eclipse.jetty.server.RequestLog">
      <AppenderRef ref="HttpLog" />
    </Logger>
    <Logger name="com.ocient.lat.sink.file.FileErrorSink" level="info" additivity
      <AppenderRef ref="ErrorLog" />
      <!--
      <AppenderRef ref="Graylog" />
      -->
    </Logger>
    <Logger name="software.amazon.awssdk" level="info" />
    <Logger name="io.netty" level="info" />
    <Root level="info">
      <AppenderRef ref="LATLog" />
      <!--
      <AppenderRef ref="Graylog" />
      -->
    </Root>
  </Loggers>
</Configuration>
```

Relevant Loggers:

- `org.apache.kafka`: Apache® Kafka® logger.
- `com.ocient.lat.sink.ocient.Binders.Binder`: LAT binder logger. Can be verbose, recommended to keep at `info` level.
- `org.eclipse.jetty.server.HttpChannel` and `org.eclipse.jetty.server.RequestLog`: Jetty logs for the HTTP endpoint.
- `com.ocient.lat.Worker`: Main worker logger containing important pipeline logs.

Valid log levels are (in order of least to most verbose):

- `error`
- `warn`
- `info`
- `debug`
- `trace`

Log4j can be configured to log different packages at different levels as shown in the example. Here, the example logs the `com.ocient.streaming.client` package at the trace level, but the remainder of the code is logged at info level.

# LAT Packaging and Installation

(deprecated) Package and install the Ocient Loading and Transformation (LAT) client and service, including standalone, distributed, and disconnected deployment options.

> ⚠ Data Pipelines are now the preferred method for loading data into the Ocient® System. For details, see **Load Data**. The LAT loading functionality will be removed in version 29.0.

The Ocient LAT supports multiple types of packages for deployment and installation:

- Debian® `.deb` package
- CentOS® `.rpm` package
- Raw `.tar.gz` tar folder
- Direct .jar
- Docker® container

Contact Ocient Support for the latest package for a deployment method.

## Prerequisites

- Java® 17 or greater
  - Can either be system-level Java, or installed somewhere accessible by the user.

> ⚠ The LAT must run on Ocient Loader Nodes where you installed the Ocient RPM to provide access to numerical libraries, ensuring the correct loading of geospatial data types. If this condition is not met, some geospatial objects might load inaccurately.

## Debian/CentOS Packages

### 1. Install/Upgrade

Debian: `sudo dpkg -i lat_$VERSION_all.deb`

CentOS: `sudo rpm -i lat-$VERSION-1.noarch.rpm`

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

### 2. Setup Java

If the default system Java is version 17 or greater, no action is required. If not, edit the service file to contain a `JAVA_HOME` environment variable pointing to a Java version 17 or greater installation.

1. Run: `systemctl edit lat`
2. Insert the following

```shell
[Service]
Environment=JAVA_HOME="PATH_TO_JAVA_HOME"
```

### 3. Configure

Modify the **LAT Source Configuration** and **LAT Log4J Configuration** (see **Package Contents** for file locations).

> It is recommended to use the `.conf` file for most LAT configuration. However, `LAT_MEMORY` and `LAT_MEMORY_DIRECT` can only be set by using environment variable. For these use the same process as setting `JAVA_HOME` as detailed in step 2.

### 4. Start/Stop

Start: `systemctl start lat`

Stop: `systemctl stop lat`

## Package Contents

- Jar: `/opt/lat/lat-$VERSION.jar`
- Service File: `/usr/lib/systemd/system/lat.service`
- Configuration: `/etc/lat/`
  - Server Configuration: `lat.conf`
  - Logging Configuration: `log4j2.xml`
- Logs: `/var/log/lat/lat.log`

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

- LAT data directory: `/opt/lat/.lat-data`

# Tar Folder

### 1. Extract file in your preferred location

Run: `tar -xzf lat-$VERSION.tar.gz`

### 2. Setup Java

If the default system Java is version 17 or greater, no action is required. If not, set the `$JAVA_HOME` environment variable to a Java installation with version 17 or greater:

```
export JAVA_HOME="PATH_TO_JAVA_HOME"
```

### 3. Configure

Modify the **LAT Source Configuration** and **LAT Log4J Configuration** (see **Folder Contents** for file locations).

> It is recommended to use the `.conf` file for most LAT configuration. However, `LAT_MEMORY` and `LAT_MEMORY_DIRECT` can only be set using environment variable. For these use the same process as setting `JAVA_HOME` as detailed in step 2.

### 4. Start/Stop

Start: `./lat.sh [path]`, where `path` is an optional parameter for the path to a server configuration file (e.g., `lat.conf`). If `path` is not present, it will default to `config/lat.conf`.

Stop: Stop the running `lat.sh` script with `ctrl-c`.

## Folder Contents

- Jar: `lat-$VERSION.jar`
- Configuration: `config/`
  - Server Configuration: `lat.conf`
  - Logging Configuration: `log4j2.xml`
- Start Script: `lat.sh`

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

- LAT data directory: `.lat-data`

# Jar Direct

The LAT is a Java jar that can be deployed on any machine running Java 17+.

To run the LAT use the following command line statement:

Shell

```
java [options] -Dlog4j.configurationFile=<log4j-config-path> -jar <lat-jar-path> [l
```

- `log4j-config-path` : REQUIRED : path to the log4j configuration file
- `lat-jar-path` : REQUIRED : path to the LAT jar
- `lat-config-path` : OPTIONAL : path to a LAT service configuration file

## Recommended Java Command Line Options

See the **Java command line documentation** for options.

## Max Direct Memory Size

| **Option:** | **-XX:MaxDirectMemorySize** |
|---|---|
| Recommended: | 32G |
| Example: | -XX:MaxDirectMemorySize=32G |

## Minimum Heap Size

| **Option:** | **-Xms** |
|---|---|
| Recommended: | 32G |
| Example: | -Xms=32G |

## Maximum Heap Size

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Option: | -Xmx |
| --- | --- |
| Recommended: | 32G |
| Example: | -Xmx=32G |

### Example Java Command Line

Shell

```
java \
  -Dlog4j.configurationFile=config/log4j2.xml \
  -XX:MaxDirectMemorySize=32G \
  -Xms32G \
  -Xmx32G \
  -jar lat-[VERSION NUMBER].jar \
  config/lat.conf
```

## Docker Container

Ocient provides a Docker container for the LAT for testing workloads.

> The container is not recommended for production workloads and should be used for testing only.

### Configuration

The only mode of configuring the LAT within a Docker container is by using the service configuration environment variables. A `lat.conf` file is not supported.

See **LAT Service Configuration** for the list of supported environment variables.

It is not recommended to override the following environment variables.

- `LAT_DATA_PATH`
- `LAT_API_PORT`

### Logging

Within the Docker container the LAT logs `stdout`. The user can use the `docker logs ...` command to view the LAT logs.

The following environment variables are available to modify the log level of various loggers. See **LAT Log4J Configuration** for descriptions of the loggers and log levels.

### `ROOT_LOG_LEVEL`

| **Logger:** | **root** |
|---|---|
| Default: | debug |

### `BINDERS_LOG_LEVEL`

| **Logger:** | **com.ocient.lat.sink.ocient.Binders.Binder** |
|---|---|
| Default: | info |

### `HTTP_LOG_LEVEL`

| **Logger:** | **org.eclipse.jetty.server.HttpChannel** |
|---|---|
| Default: | debug |

### `KAFKA_LOG_LEVEL`

| **Logger:** | **org.apache.kafka** |
|---|---|
| Default: | info |

## Java

The `JAVA_OPTS` environment variable is available for controlling JVM® settings. Container defaults to default JVM settings.

See the **Java command line documentation** for detail on the command line options.

Example:

Shell

```
JAVA_OPTS="-XX:MaxDirectMemorySize=32G -Xms32G -Xmx32G"
```

## Data Volumes

The LAT in the docker container writes persistent data to `/lat/data`. It is recommended to mount a volume to this path so that the data can outlive the container instance. The **Error Log File** is also written to this path if configured. If viewing this error file is necessary, a volume must be used.

Do not use the `LAT_DATA_PATH` configuration to override the data path inside the docker container. It will cause the LAT to write data and error logs into different locations and will require two volumes.

If using the Local File Source, the user must mount the data directory as a bind mount inside the container. It is recommended to mount to a location under the `/lat/` directory. When configuring the local file source the bind mount path should be configured with a file group.

## Ports

By default the LAT API listens on port `8080`. It is not recommended to override the `LAT_API_PORT` environment variable and instead use Docker's port mapping functionality.

## Examples

## Docker

Shell

```
docker run --rm --name lat \
  --env ROOT_LOG_LEVEL=info \
  --env JAVA_OPTS="-XX:MaxDirectMemorySize=32G -Xms32G -Xmx32G" \
  -p 8080:8080 \
  --mount source=lat-data,target=/lat/data \
  lat:2.0.0
```

## Docker Compose

YAML

```yaml
---
version: '3.9'
services:
  lat:
    image: lat:2.0.0
    ports:
      - "8080:8080"
    restart: on-failure
    volumes:
      - lat-data:/lat/data
    environment:
      JAVA_OPTS: "-XX:MaxDirectMemorySize=32G -Xms32G -Xmx32G"
      ROOT_LOG_LEVEL: info

volumes:
  lat-data:
```

# LAT Advanced Topics

(deprecated) Advanced topics for the Ocient Loading and Transformation (LAT) system, including dynamic schema changes, error management, and complex pipeline behaviors.

> ⚠ Data Pipelines are now the preferred method for loading data into the Ocient® System. For details, see **Load Data**. The LAT loading functionality will be removed in version 29.0.

## Addition of an LAT Instance to the Loading Path

Use these steps to add an LAT instance to the loading path:

1. Stop the LAT process on all Loader Nodes using `sudo systemctl stop lat`.
2. Copy `/opt/lat/.lat-data/pipeline/pipeline.json` from one of the Loader Nodes to the new node.
3. On the new node, execute this command: `sudo chown lat:lat /opt/lat/.lat-data/pipeline/pipeline.json`
4. On the new node, execute this command: `sudo chmod 644 /opt/lat/.lat-data/pipeline/pipeline.json`
5. Start the LAT process on all Loader Nodes using `sudo systemctl start lat`.

## Removal of an LAT Instance from the Loading Path

Use these steps to remove an LAT instance from the loading path:

1. Stop the LAT process on all Loader Nodes using `sudo systemctl stop lat`.
2. Delete the `/opt/lat/.lat-data/pipeline/pipeline.json` from the chosen node.
3. Start the LAT process on all Loader Nodes using `sudo systemctl start lat`.
4. For file loading, rebalance the load across the remaining nodes. For details, see the `pipeline rebalance` command in **LAT Client Command Line Interface**.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

For a load using Apache® Kafka®, shut down the service on the chosen node and delete the configuration.

## Dynamic Schema Changes

The loading system in Ocient is designed to support dynamic schema changes. The LAT allows data to load continuously even while database tables are altered (e.g., ADD COLUMN, DROP COLUMN). In this way dynamic changes can occur on the database and the pipeline can be updated later to begin streaming the revised data through the pipeline into the revised tables. The typical flow for updating a table is to first execute a DDL Command such as "`ALTER TABLE … ADD COLUMN …`" and then when it is completed to execute the update on the LAT Pipeline to include (or remove) the altered column in the transformation.

## Error Sink

The LAT provides two ways to view loading, transformation, or binding errors that occur during a pipeline.

### Kafka Error Topic

If a Kafka source is used, failed records can optionally be routed to a configurable **error_topic**. This topic will contain the records that fail and their failure reason/exception. The topic can be used to gain insight into why a given record failed to load. Each entry in the topic will contain the following:

- Value[byte[]]: A byte array containing the record itself.
- Headers:
  - topic: The topic from which the record originated.
  - partition: The partition from which the record originated.
  - offset: The partition offset from which the record originated.
  - state: The state of the record (the location where the record encountered an error).
  - exception: The exception associated with the error
  - exception_message: The exception message, if it exists.

### Error Log File

If you use a File source, or if the Error Topic configuration is not set, the LAT sends errors to a dedicated error log file. If you use the default `log4j2` configuration, this error log can be found alongside the rest of the LAT logs in `error.log` and accessed using the LAT Client with the **Subcommands**.

If you use a custom `log4j2` configuration, your appender configuration should look similar to this code.

XML

```
<RollingRandomAccessFile name="ErrorLog" append="true" fileName="logs/error.log"
    <PatternLayout pattern="%m%n" />
    <Policies>
        <SizeBasedTriggeringPolicy size="100 MB" />
    </Policies>
    <DefaultRolloverStrategy fileIndex="nomax">
        <Delete basePath="logs">
            <IfFileName glob="error.*.log.gz" />
            <IfAccumulatedFileSize exceeds="20 GB" />
        </Delete>
    </DefaultRolloverStrategy>
</RollingRandomAccessFile>
```

If the **LAT_ALLOW_LOG_ORIGINAL_RECORDS** service configuration and the **log_original_records** pipeline configuration are both set to `true`, the error log file includes a JSON representation of the record that caused an error.

> ⚠ If you use a custom `log4j2` configuration, you must still use a `RollingRandomAccessFileAppender` named `ErrorLog`. Also, `PatternLayout` must still be `%m%n`, because the errors API can retrieve errors. If you do not use `RollingRandomAccessFileAppender`, the LAT does not start. If `PatternLayout` is not correct, the errors API does not work.

## Understanding Deduplication

The LAT loads rows from data sources in an exactly-once fashion. This is made possible by row level deduplication for LAT pipelines and the ability to replay records from a

source. In short, if the same records are replayed through the LAT, there are specific scenarios that guarantee that no duplicate records will be persisted into the Ocient tables.

For a deeper understanding this works, a few key concepts are explained here:

- Partitioning Data
- The Durability Horizon
- Deduplication Scope

## Partitioning Data

To deliver high throughput loading, the LAT partitions the data source into independent sets of data. These are then loaded in parallel across all LAT instances. Each partition is considered a well-ordered sequence of rows that is replayable.

Some sources like Kafka natively support the concept of partitions and have a native record ID as part of their protocol.

Others, like a batch of files from Amazon® Web Services™ (AWS™) S3, require LAT to partition the data on its own and assign a record ID. For file loading, LAT establishes a record ID based on the sorted list of files in the file group and the row of each record within the files.

⚠ Altering the list of files in the target directory on the source system can change the record ID. This will impair the ability of the LAT to properly deduplicate rows if a file loading pipeline is stopped and restarted.

## The Durability Horizon

Within a partition, each record is assigned a unique record ID. This ID is monotonically increasing within a partition. As data is loaded through the LAT and into Ocient's page stores, this data is said to become "Durable" meaning that in the event of a node shutdown, the data would be preserved on non-volatile storage. At this point the record is no longer in memory, but stored on disk in a redundant fashion. The "Durability Horizon" is the largest record ID that has become Durable on each partition of data. If a previously loaded record were replayed it is recognized as a duplicate of the original record and ignored. New records are loaded and the Durability Horizon is increased.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

## Deduplication Scope

Deduplication is constrained based on a few settings in the LAT pipeline configuration. Each pipeline ID is considered an independent loading task. Additionally, each topic or file group is considered an independent data set. As a result, deduplication does not apply between different pipelines or different topics and file groups even if they are loading the same underlying files.

Records are deduplicated when all of the following are true:

1. The pipeline ID matches
2. The topic name or file group name matches

When this is true, any record with a record ID less than or equal to the current Durability Horizon will be considered a duplicate and ignored. When the record ID has progressed higher than the Durability Horizon, then new data will begin loading into the database.

If no `pipeline_id` is set, the LAT Client will automatically assign a randomly generated ID, resulting in no deduplication across different pipelines. In the event that you want deduplication between multiple pipelines, the `pipeline_id` should be copied from the previous pipeline and explicitly set. The topic/file groups must also be the same to ensure deduplication.

> ⚠ When updating an existing file load pipeline to select a different group of files by altering start/stop time or another filter, be sure to use a new pipeline ID (best accomplished by avoiding setting an explicit pipeline ID when creating the pipeline with the client). Otherwise, unexpected results can occur such as rows in a new file being considered a duplicate.

## V1 → V2 Migration

LAT V2 modified the way the deduplication scope is calculated. In V1 only the topic name was used for scope calculation. Therefore, to maintain deduplication in a pipeline that is being upgraded from V1 to V2 **must be explicitly set to (the empty string)** upon creation.

# LAT Client Command Line Interface

(deprecated) Install and use the Ocient LAT client command-line interface to create, deploy, start, stop, monitor, and manage loading and transformation pipelines.

> ⚠ Data Pipelines are now the preferred method for loading data into the Ocient® System. For details, see **Load Data**. The LAT loading functionality will be removed in version 29.0.

The LAT Client can be used to interact with a running LAT instance. It supports subcommands for interacting with pipelines, and previewing transformations.

The LAT Client is distributed in the form of a Python® wheel file. Contact Ocient Support for the wheel that corresponds to the LAT version.

## Prerequisites

- Python >= 3.8
- pip3 >= 20.2.3
  - If `pip install` fails, try upgrading `pip`.
- Wheel Python package
  - `pip install wheel`

## Install

It is recommended to install the wheel in a Python virtual environment to avoid conflicts with globally installed Python packages. For the install command, replace `$VERSION` with the latest version of the LAT client.

Steps:

1. Create the virtual environment. `python3 -m venv venv`
2. Activate the virtual environment. `source venv/bin/activate`
3. Install the wheel. `pip install lat_client-$VERSION-py3-none-any.whl`
4. Run commands with `lat_client COMMAND ARGS`

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

5. When a new terminal is opened, repeat step 2 to activate the environment and gain access to the `lat_client` command.

## Usage

Get help on the command line:

```shell
lat_client --help
lat_client <subcommand> --help
```

## Common Arguments

Some arguments are available on all subcommands. For convenience, most of them can also be set using an environment variable.

`--no-verify`

Skip certificate validation when connecting to LAT. Ignored if using http scheme

| | |
|---|---|
| **Example:** | `--no-verify` |

`--hosts (LAT_HOSTS)`

One or more LAT hosts to orchestrate. Valid domain names or IP addresses can be used.

| | |
|---|---|
| **Example:** | `--hosts http://192.168.0.1:8080 http://192.168.0.2:8081` |
| Environment: | `export LAT_HOSTS="http://10.4.0.1:8080,http://10.4.0.2:8081"` |

`--oauth-domain (LAT_OAUTH_DOMAIN)`

OKTA® OAuth domain to use for token acquisition.

| | |
|---|---|
| **Example:** | `--oauth-domain https://dev-12345678.okta.com` |
| Environment: | `export LAT_OAUTH_DOMAIN="https://dev-12345678.okta.com"` |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

`--oauth-server (LAT_OAUTH_SERVER)`

Okta OAuth authorization server to use for token acquisition.

| | |
|---|---|
| **Example:** | `--oauth-server abcdef000ghijklm111` |
| Environment: | `export LAT_OAUTH_SERVER="abcdef000ghijklm111"` |

`--client-id (LAT_CLIENT_ID)`

Okta client id to use for token acquisition.

| | |
|---|---|
| **Example:** | `--client-id 12345678` |
| Environment: | `export LAT_CLIENT_ID="12345678"` |

`--client-secret (LAT_CLIENT_SECRET)`

Okta client secret to use for token acquisition.

| | |
|---|---|
| **Example:** | `--client-secret abc123` |
| Environment: | `export LAT_CLIENT_SECRET="abc123"` |

`--oauth-http-proxy (LAT_OAUTH_HTTP_PROXY)`

HTTP proxy URL to use for token acquisition. Authentication credentials can be passed in proxy URL.

| | |
|---|---|
| **Example:** | `--oauth-http-proxy http://user:pass@some.proxy.com` |
| Environment: | `export LAT_OAUTH_HTTP_PROXY="http://user:pass@some.proxy.com"` |

## Subcommands

`pipeline create`

Create a new pipeline.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

For most use cases, it is advisable to leave the `pipeline_id` unset when creating a pipeline. The client will set it to a random UUID to prevent deduplication across different pipelines. In the event that you want deduplication between pipelines, the `pipeline_id` should be copied from the previous pipeline and included in the new pipeline. The **LAT Transform Configuration** must also be the same to ensure deduplication.

When the client is used to create a pipeline with a file source, the client will make adjustments to the source configuration such that partitions are assigned evenly across nodes.

First, the client will get the number of workers from the pipeline. If one is not set, it will use the minimum configured `lat.default.workers` instead. Then, it will set `partitions = workers * num_nodes`. Finally, it will set `partitions_assigned = [workers * node_index, workers * (node_index + 1) - 1]` for each node.

| | |
|---|---|
| **Arguments:** | `--pipeline` **: path to the pipeline configuration .json file** |
| **Example:** | `lat_client pipeline create --pipeline /home/user/my_new_pipeline.json` |

`pipeline get`

Get the configuration for an existing pipeline.

If the configured pipelines are identical, print the pipeline, otherwise an explanation of the inconsistency will be provided.

For pipelines with a file source, `partitions_assigned` is ignored when checking if pipelines are identical. Additionally, the client will validate that all partitions are assigned, and that no partition is assigned more than once.

| | |
|---|---|
| **Example:** | `lat_client pipeline get` |

`pipeline update`

Update the configuration for an existing pipeline.

The new pipeline can only make changes to subfields in `transform`, *except* for any `topic` / `file_group` names. All other subfields of `transform` are allowed to change, including to the `table` and `column` fields.

For pipelines with a file source, partition assignments will be copied from the existing pipeline.

If the pipeline was running prior to the update, successful completion of this command will automatically restart the pipeline.

| | |
|---|---|
| **Arguments:** | **`--pipeline`: path to the pipeline configuration .json file** |
| **Example:** | `lat_client pipeline update --pipeline /home/user/my_new_pipeline.json` |

`pipeline delete`

Delete an existing pipeline.

Unless the `--force` flag is used, a pipeline must be stopped, or deletion will fail.

| | |
|---|---|
| **Arguments:** | **- `--force`: Force a pipeline to delete regardless of running status**<br>**- `--skip-validation`: Delete a pipeline regardless of cluster consistency** |
| **Example:** | lat_client pipeline delete —skip-validation |

`pipeline start`

Start the configured pipeline.

Prior to starting the pipeline, the pipeline start subcommand will validate that all specified hosts are configured with an identical pipeline, except for pipelines with a file source, which must have different `partitions_assigned` such that each partition is assigned exactly once across all hosts.

| | |
|---|---|
| **Example:** | `lat_client pipeline start` |

`pipeline stop`

Stop the configured pipeline.

| | |
|---|---|
| **Example:** | `lat_client pipeline stop` |

`pipeline status`

Retrieve status of the pipeline. The valid pipeline statuses are `STOPPED`, `RUNNING`, `COMPLETED`, and `FAILED`. When the pipeline is `FAILED`, the file statuses will remain in processing.

| | |
|---|---|
| **Arguments:** | **`--list-files`: Lists selected files in their sorted order for each file group, along with file statuses (`completed`, `processing`, `not_started`). Output is summarized to be human readable. The system truncates large file lists.** |
| **Arguments:** | `--list-all-files`: Lists all selected files in their sorted order for each file group, along with file statuses (`completed`, `processing`, `not_started`). |
| **Example:** | `lat_client pipeline status` |

`pipeline errors`

Retrieve errors that occur while the current pipeline runs.

| | |
|---|---|
| **Arguments:** | **- `--json`: output errors as lines of JSON rather than in the default human-readable format**<br>**- `--max-errors` MAX_ERRORS: an upper limit on the number of errors to retrieve (default is 100)**<br>**- `--only-records`: only show records (not error messages or other information)**<br>**- `--only-error-messages`: only show error messages (not records or other information)**<br>**- `--no-records`: show all information except records** |
| **Example:** | `lat_client pipeline errors --no-records --max-errors 10` |

`pipeline rebalance`

Rebalances partitions evenly to all provided LAT Nodes.

> This subcommand only applies to pipelines running file sources.

This command is meant to be used in the case of a node outage during a file load. LAT file loading does not support automatic partition re-balancing and manual intervention is required. The flow is as follows:

1. LAT Node goes offline.
2. LAT operator rebalances the partitions from the offline node onto the online nodes using the client. The operator should use the rebalance command and omit the offline node from the hosts argument.
3. LAT Node comes back online.
4. LAT operator rebalances partitions using the client to include all nodes including the newly online node. The operator should use the rebalance command and include all online nodes in the hosts argument.

**Example:** `lat_client pipeline rebalance`

---

`sink create`

Create a new sink configuration.

> The sink configuration file for this subcommand should match the same format as the **LAT Sink Configuration**. For example:
>
> Text
>
> ```
> {  "type": "ocient",  "remotes": ["1.2.3.4:5050"]}
> ```

**Arguments:**

- `--sink` **: path to the sink configuration .json file**
- `--name` **: Name of the sink to create**
- `--default` **: set this as the default sink**

**Example:** `lat_client sink create --sink /home/user/my_sink_config.json --name my-sink-name-1 --default`

---

`sink delete`

Delete a sink configuration. The sink configuration must not be part of a created or running pipeline.

| | |
|---|---|
| **Arguments:** | `--name` **: Name of the sink to delete** |
| **Example:** | `lat_client sink delete --name my-sink-name-1` |

`sink list`

List all configured sinks.

| | |
|---|---|
| **Example:** | `lat_client sink list` |

`sink get`

Get a sink configuration by id.

| | |
|---|---|
| **Arguments:** | `--name` **: Name of the sink to get configuration for.** |
| **Example:** | `lat_client sink get --name my-sink-name-1` |

`preview`

Preview a transformation.

At most one of `--transform` or `--pipeline` can be provided. If neither is provided, the host will attempt to use the transformation configured in its pipeline.

You can specify the `--extract` or `--pipeline` option. If you specify none of these options, the host uses the JSON Extractor by default. For details about record and extractor types, see the **LAT Extract Configuration**.

You must specify the `--topic` or `--file-group` option, which should match the `topic` or `file_group` key in the specified `transform` section.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| | |
|---|---|
| **Arguments:** | **- `--topic` name of the topic the records are associated with<br>- `--file-group` name of the file group the records are associated with<br>- `--records` path to a file of records to transform. Record formats can be of Delimited Records (e.g., CSV, TSV), JSON Records, or Fixed Width Binary Records.<br>- `--extract` [Optional] path to a .json file containing the extract section of a pipeline definition to use for extraction.<br>- `--transform` [Optional] path to a .json file containing the transform section of a pipeline definition to use for transformation.<br>- `--pipeline` [Optional] path to a .json file containing a pipeline to use for transformation and extraction, if present.** |
| **Example without pipeline:** | `lat_client preview --topic test_topic --records ./data/my_records --extract /home/user/my_extract.json --transform /home/user/my_transform.json` |
| **Example using pipeline:** | `lat_client preview --topic test_topic --records ./data/my_records --pipeline /home/user/my_pipeline.json` |

## Common Workflows

### Check on Status of LAT Pipelines

Shell

```
$ lat_client pipeline status
10.4.0.1:8080: STOPPED
10.4.0.2:8080: STOPPED
10.4.0.3:8080: STOPPED

$ lat_client pipeline status --hosts https://10.4.0.1:8080
10.4.0.1:8080: STOPPED
```

### Updating an Existing LAT Pipeline

Shell

```
lat_client pipeline update --pipeline /home/user/my_new_pipeline.json
```

If the pipeline was running prior to the update, successful completion of this command will automatically restart the pipeline.

If unsuccessful, the CLI will report an error with an explanation of what is wrong with the command. Common issues are invalid JSON, missing a required column. An unsuccessful update of the pipeline config does not impact actively running pipelines.

### Restart the Pipeline

Shell

```
## First, stop the running pipelines. To send custom hosts, use --hosts IP1:port IP
$ lat_client pipeline stop
Stopped: 10.4.0.1:8080, 10.4.0.2:8080, 10.4.0.3:8080

## Then, start the pipelines.
$ lat_client pipeline start
Started:
10.4.0.1:8080, 10.4.0.2:8080, 10.4.0.3:8080
```

### Check Multiple LAT Nodes to See If the Pipeline Configurations Are Compatible

Shell

```
## hosts with compatible pipelines
$ lat_client pipeline get --hosts https://10.4.0.1:8080 https://10.4.0.2:8080 https
{
    "pipeline_id": "91326229-5fc6-4542-99ce-87bdcb00a978",
    "version": 2,
    "source": { ... },
    "sink": { ... },
    "transform": { ... }
}

## hosts with incompatible pipeline
$ lat_client pipeline get --hosts https://10.4.0.1:8080 https://10.4.0.2:8080 https
Hosts responded with incompatible pipelines:
  b5a6e8647cd3a28d4a5bd07cd1c491ce: 10.4.0.1:8080, 10.4.0.2:8080
  160f270e39d7a51a431c841613e4dc4e: 10.4.0.3:8080
```

The CLI will compare the MD5 hash of the pipeline configurations on all nodes and respond that all pipelines match or are inconsistent.

© 2026 Ocient, Inc

## LAT Client Command Line Interface Troubleshooting

If the certificate authorities on the system running the Python client (LAT Client) need to be updated, an error can occur. This type of error message might appear.

Shell

```
ssl.SSLCertVerificationError: [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify f
```

You can run this command to resolve the error.

Shell

```
pip install -upgrade certifi
```

The root cause of this error can be a connection to either the LAT Server over SSL or an authentication to Okta to obtain an access token over SSL. You can run the same command in both cases to resolve the issue.

When the SSL certificate is self-signed on the LAT Server, you can use the `--no-verify` flag when you connect to the LAT Server without verifying the SSL Certificate.

**Ingest Data with Legacy LAT Reference**

**Install an Ocient System**

© 2026 Ocient All Rights Reserved Terms Of Use Privacy Statement

# Install LAT Client in a Disconnected Network

(deprecated) Install the Ocient Loading and Transformation (LAT) client in a disconnected or air-gapped network, including offline package distribution and setup steps.

> ⚠ Data Pipelines are now the preferred method for loading data into the Ocient® System. For details, see **Load Data**. The LAT loading functionality will be removed in version 29.0.

Operate the LAT Client in a disconnected network using these steps to install the LAT Client.

## Requirements

On the Red Hat® Enterprise Linux® (RHEL®) version 8.0, the Python® version 3.6.8 specifies the default `python3` requirement and the LAT Client requires Python version 3.8 or greater.

Contact Ocient Support for the LAT Client Python wheel file.

Install the LAT Client Python wheel by first gathering the RPMs for Python 3.11 on a system with access to the appropriate software repository `python3.11` and its dependencies:

- `mpdecimal`
- `python3.11-libs`
- `python3.11-pip-wheel`
- `python3.11-setuptools-wheel`

Use your regular path for the Python packages.

Gather the `lat_client` and its dependencies ( `.whl` files). Execute this download command on a machine with Python 3.11 and `pip` installed.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

Shell

```
$ pip download lat_client-3.1.2-py3-none-any.whl
```

This command downloads these dependencies.

Shell

```
lat_client
  aiohttp==3.9.3
    aiosignal==1.3.1
      frozenlist==1.4.1
    attrs==23.2.0
    frozenlist==1.4.1
    multidict==6.0.5
    yarl==1.9.4
      idna==3.6
      multidict==6.0.5
  more-itertools==10.2.0
  pydantic==2.6.4
    annotated-types==0.6.0
    pydantic_core==2.16.3
      typing_extensions==4.10.0
    typing_extensions==4.10.0
  rich==13.7.1
    markdown-it-py==3.0.0
      mdurl==0.1.2
    Pygments==2.17.2
  wheel==0.43.0
```

Copy the RPMs and wheel files to the machine in the disconnected network.

## Install the LAT Client

Install Python 3.11 on the machine in the disconnected network where `<python3.11 RPM>` is the path to the Python 3.11 RPM. `<mpdecimal rpm>` is the path to a dependency of Python 3.11. You can list more dependencies in this way using spaces between each one.

Shell

```
dnf install <python3.11 RPM> <mpdecimal rpm>
```

After Python 3.11 is installed, create a `venv` to install the LAT Client and its dependencies.

Shell

```
$ /usr/bin/python3.11 -m venv venv
```

Enter the `venv`.

Shell

```
$ source venv/bin/activate
```

Install `lat_client` and its dependencies in the `venv`. Specify wheel files `<wheels>` as paths to wheel files separated by spaces.

Shell

```
(venv)$ pip install lat_client-3.1.2-py3-none-any.whl <wheels>
```

Check that the LAT Client runs.

Shell

```
(venv)$ lat_client --version
3.1.2
```

# Version Compatibility

Reference for Ocient version compatibility between server, JDBC, pyocient, LAT, and integrations to plan upgrades and avoid client-server mismatch issues.

## Recommended JDBC Driver Versions

This table describes the recommended versions of the JDBC driver and Java® for each Ocient® System release.

| Ocient System Version | JDBC Driver Version | Java Version |
|---|---|---|
| 28.0 | 4.3.0 | 8 or later |
| 27.1 | 4.2.0 | 8 or later |
| 27.0 | 4.1.0 | 8 or later |
| 26.1 | 3.7.0 and 4.0.0 | 8 or later |
| 25.5 | 3.6.7, 3.6.6, 3.6.5, and 3.6.4 | 8 or later |
| 25.2 | 3.5.1 | 8 or later |
| 25.1 | 3.4.1 | 8 or later |
| 25.0 | 3.3.1 | 8 or later |
| 24.3 and 24.4 | 3.2.x | 11 or later |
| 23.1, 24.0, 24.1, and 24.2 | 3.1.7 | 8 or later |
| 23.0 | 3.0 | 8 or later |

JDBC versions 3.2.x are not compatible with Java 8. Version 3.3.0 is compatible.

## JDBC API Compatibility

This table describes the specifications for each version of the JDBC API and whether it is supported by the latest Ocient JDBC driver.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| JDBC API Version | Requirement | Support as of JDBC 4.0.0 |
|---|---|---|
| 4.3 | Enhanced DatabaseMetaData to determine if Sharding is supported | Supported |
| 4.3 | Added the method drivers to DriverManager to return a Stream of the currently loaded and available JDBC drivers | Supported |
| 4.3 | Added support to Statement for enquoting literals and simple identifiers | Supported |
| 4.3 | Clarified the Java SE version that methods were deprecated | Supported |
| 4.3 | Added Sharding support | Not Supported |
| 4.3 | Enhanced Connection to be able to provide hints to the driver that a request, an independent unit of work, is beginning or ending | Not Supported |
| 4.2 | Added JDBCType enum and SQLType interface | Supported |
| 4.2 | Added support for large update counts | Supported |
| 4.2 | DatabaseMetaData methods to return the maximum Logical LOB size and if Ref Cursors are supported | Supported |
| 4.2 | Support for REF CURSORS in CallableStatement | Not Supported |
| 4.1 | Allow Connection, ResultSet and Statement objects to be used with the try-with-resources statement | Supported |
| 4.1 | Support added to CallableStatement and ResultSet to specify the Java type to convert to using the getObject method | Supported |
| 4.1 | Added support to Connection to specify a database schema, abort and timeout a physical connection. | Supported |
| 4.1 | DatabaseMetaData methods to return PseudoColumns and if a generated key is always returned | Not Supported |
| 4.1 | Added support to close a Statement object when its dependent objects have been closed | Not Supported |
| 4.1 | Support for obtaining the parent logger for a Driver, DataSource, ConnectionPoolDataSource and XADataSource | Not Supported |
| 4.0 | auto java.sql.Driver discovery — no longer need to load a java.sql.Driver class using Class.forName | Supported |

© 2026 Ocient, Inc

| JDBC API Version | Requirement | Support as of JDBC 4.0.0 |
|---|---|---|
| 4.0 | National Character Set support added | Supported |
| 4.0 | Support added for the SQL:2003 XML data type | Not Supported |
| 4.0 | SQLException enhancements — Added support for cause chaining; New SQLExceptions added for common SQLState class value codes | Not Supported |
| 4.0 | Enhanced Blob/Clob functionality — Support provided to create and free a Blob/Clob instance as well as additional methods added to improve accessibility | Supported |
| 4.0 | Support added for accessing a SQL ROWID | Not Supported |
| 4.0 | Support added to allow a JDBC application to access an instance of a JDBC resource that has been wrapped by a vendor, usually in an application server or connection pooling environment. | Supported |
| 4.0 | Availability to be notified when a PreparedStatement that is associated with a PooledConnection has been closed or the driver determines is invalid | Not Supported |
| 3.0 | Pooled statements — reuse of statements associated with a pooled connection | Supported |
| 3.0 | Savepoints — allow a transaction to be rolled back to a designated savepoint | Not Supported |
| 3.0 | Properties defined for ConnectionPoolDataSource — specify how connections are to be pooled | Not Supported |
| 3.0 | Metadata for parameters of a PreparedStatement object | Not Supported |
| 3.0 | Ability to retrieve values from automatically generated columns | Not Supported |
| 3.0 | Ability to have multiple ResultSet objects returned from CallableStatement objects open at the same time | Not Supported |
| 3.0 | Ability to identify parameters to CallableStatement objects by name as well as by index | Not Supported |
| 3.0 | ResultSet holdability — ability to specify whether cursors should be held open or closed at the end of a transaction | Not Supported |
| 3.0 | Ability to retrieve and update the SQL structured type instance that a Ref object references | Not Supported |
| 3.0 | Ability to programmatically update BLOB, CLOB, and ARRAY values. | Supported |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| JDBC API Version | Requirement | Support as of JDBC 4.0.0 |
|---|---|---|
| 3.0 | Addition of the java.sql.Types.DATALINK data type — allows JDBC drivers access to objects stored outside a data source | Not Supported |
| 3.0 | Addition of metadata for retrieving SQL type hierarchies | Not Supported |
| 2.1 | Scrollable result sets—using new methods in the ResultSet interface that allow the cursor to be moved to a particular row or to a position relative to its current position | Not Supported |
| 2.1 | Batch updates | Supported |
| 2.1 | Programmatic updates—using ResultSet updater methods | Not Supported |
| 2.1 | New data types—interfaces mapping the SQL3 data types | Supported |
| 2.1 | Custom mapping of user-defined types (UDTs) | Not Supported |
| 2.1 | Miscellaneous features, including performance hints, the use of character streams, full precision for java.math.BigDecimal values, additional security, and support for time zones in date, time, and timestamp values. | Supported |
| 2.0 | Pooled connections — allowing connections to be used and reused | Supported |
| 2.0 | Distributed transactions — allowing a transaction to span diverse DBMS servers | Not Supported |
| 2.0 | The DataSource interface as a means of making a connection. The Java Naming and Directory Interface™ (JNDI) is used for registering a DataSource object with a naming service and also for retrieving it. | Not Supported |
| 2.0 | RowSet technology — providing a convenient means of handling and passing data | Not Supported |

# Recommended LAT Versions

This table describes the recommended Ocient Loading and Transformation (LAT) versions for each Ocient System release.

| Ocient System Version | Minimum Version | Recommended Version |
|---|---|---|
| 28.0 | 3.0 | 3.6.2 |
| 27.1 | 3.0 | 3.6.2 |

LAT Version 3.0.0 and greater is only compatible with Version 22.0 and greater of the Ocient System due to a change in the calculations of empty bounding boxes on geospatial data types.

# Release Notes

Release notes for the Ocient System, summarizing new features, performance enhancements, and upgrade notes for each release.

Release notes are available for the OcientAIQ™ Unified Data Platform and the associated clients and libraries: JDBC, pyocient, OCGraph, and the Spark connector. For the corresponding release notes, see these links.

# OcientAIQ Unified Data Platform Release Notes

Release notes for the OcientAIQ Unified Data Platform, listing new features, performance improvements, bug fixes, and upgrade considerations per release.

## 28.0

### Release Highlights

- Ocient Management UI —
  - The Ocient® Management UI is now available. This web-based interface provides at-a-glance visibility into system health, query activity, data ingestion, storage utilization, and node status, and includes an interactive SQL Console and a guided Pipeline Builder for creating data pipelines without writing DDL statements. For details, see **Ocient Management UI Features** and **Ocient Management UI Configuration**.
- Data Pipeline Loading —
  - Added accurate metrics for ingest, fan-out, and filtering. Added the ability to quiesce a pipeline with the `QUIESCE` SQL statement and to use advanced `ALTER PIPELINE` options, so you can restart a pipeline at a specific file offset after making changes.
- Ocient MCP Server —
  - Added the Ocient MCP Server, distributed as the Python® package `ocientmcp`. The server implements the Model Context Protocol (MCP) so that AI agents and AI-powered code editors can discover schemas, execute SQL statements, and look up reference information in an Ocient System for local, remote, or proxied deployments. For details, see **Ocient MCP Server** and **Model Context Protocol Tools**.
- Data Flows —
  - Added data flows, which are procedural control-flow blocks that execute multiple SQL statements sequentially as a single unit. Data flows support

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

variables, `WHILE` and `FOR` loops, `IF` , `ELSEIF` , and `ELSE` branching, `TRY` and `EXCEPTION WHEN` error handling, and `RAISE` for user-defined errors. For details, see **Data Flows**.

### Features

- SQL Syntax Additions —
  - Added the `FETCH FIRST` and `FETCH NEXT` clauses as alternatives to `LIMIT` for restricting query result rows. For details, see **FETCH**.
  - Added the `ROW()` constructor as a standard alias for the `tuple()` constructor. For details, see **Tuple Functions and Operators**.
  - Added support for hexadecimal ( `0x` ), octal ( `0o` ), and binary ( `0b` ) integer literal formats, and underscore digit separators for numeric literals. For details, see **Data Type Considerations**.
  - Added the `WITH RECURSIVE` clause for defining a recursive common table expression (CTE) that references itself, enabling iterative computations such as traversing hierarchical data, generating sequences, and walking graph structures. For details, see **WITH RECURSIVE**.
  - Added multi-dimensional cross-product tables to the `sys.dummy` syntax. For details, see **Generate Tables Using sys.dummy**.
- Data Pipeline Loading —
  - Added metrics to measure load throughput, including fan-out, which you can use in real-time or historically. Also, added views for simplicity to show rows and bytes processed by the pipelines. For details, see **Pipeline Metrics Details**.
  - Enhanced the `ALTER PIPELINE SQL` statement to update the configuration and transformation of an existing data pipeline in place. You can now rename a data pipeline and update its source, monitor, bad data target, lookup sources, extraction options, and advanced tuning options without recreating the pipeline. The statement preserves the pipeline metrics across the quiesce operation and ensures a clean point from which that pipeline or a different one can safely continue loading the same tables from a consistent point.
  - Added Kerberos authentication for loading data from Apache® Hadoop® Distributed File System (HDFS) sources. You can now authenticate with a keytab

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

file or with a delegation token. Added support for loading Apache® Parquet™ data from an HDFS source. For details, see **Kerberos Authentication for HDFS Sources**.

- Array Functions —
  - Added the `ARRAY_INTERSECT_DISTINCT_COUNT` function that returns the count of distinct elements common to both input arrays. For details, see **ARRAY_INTERSECT_DISTINCT_COUNT**.
  - Added the `ARRAY_TRANSFORM_WITH_ORD` function that transforms an array using a lambda expression that receives both the element and its 1-based ordinal position. For details, see **ARRAY_TRANSFORM_WITH_ORD**.
  - Added the `JACCARD_SIMILARITY` function that returns the Jaccard similarity coefficient of two arrays, defined as the size of the intersection divided by the size of the union. For details, see **JACCARD_SIMILARITY**.
  - Added the `ZIP_WITH_ORD` function that merges two or more input arrays element-wise using a combining function that also receives the 1-based ordinal of each tuple. For details, see **ZIP_WITH_ORD**.
- Workload Management —
  - Added `GRANT` and `REVOKE` support for `USE` and `VIEW` privileges on service classes. Users with the `USE` privilege on a service class can reference it in the `USING SERVICE CLASS` query clause. The `VIEW` privilege controls visibility of the service class in the `sys.service_classes` system catalog table. For details, see **Service Class Privileges** and **Service Class**.
- Machine Learning Model Updates —
  - Added the `UNDERSAMPLING` machine learning model type, a preprocessing primitive that addresses class imbalance. The model produces a sampled output table with a more balanced class distribution. For details, see **Undersampling**.
  - Expanded training metrics for machine learning models. For details, see **Machine Learning Model Options**.
    - Classification models now report accuracy, confusion matrix, MCC, per-class, macro, or weighted precision, recall, AUC-ROC, and F1 score.

        - Regression models now report $R^2$, adjusted $R^2$, RMSE (root mean squared error), MAE, MAPE, AIC, and BIC.
        - Clustering models now report WCSS (Within-Cluster Sum of Squares) for K-Means and log-likelihood for Gaussian Mixture Models.
    - Added the `ROOT_MEAN_SQUARED_ERROR` aggregate function for evaluating machine learning model quality. For details, see **ROOT_MEAN_SQUARED_ERROR**.
    - Standardized model options across all machine learning models. Removed the `noSnapshot` option from all models. For details, see **Machine Learning Model Options**.
    - Added the `predict` and `predict_probabilities` machine learning meta functions. Unlike calling a model directly by name, meta functions wrap the model invocation and control how the model produces its output. For details, see **Machine Learning Meta Functions**.
- DDL Statements —
    - Added the `ALTER TABLE SET COMMENT` SQL statement that sets or updates the description of an existing table. For details, see **ALTER TABLE SET COMMENT**.
    - Added the `GET NODE TOKEN` and `REVOKE NODE TOKEN` SQL statements. `GET NODE TOKEN` generates a single-use bearer token so a new node can join the cluster without administrator credentials. For details, see **Node Token**.
    - Added the `REQUIRE_SSO`, `OPENAPI_ADVERTISED_ADDRESS`, `OPENAPI_ADVERTISED_PORT`, `SSL_CERTIFICATE_FILE`, and `OPENAPI_SSL_CERTIFICATE_FILE` parameters to the `CREATE CONNECTIVITY_POOL` and `ALTER CONNECTIVITY_POOL` SQL statements. For details, see **CREATE CONNECTIVITY_POOL**.
- Scalar Data Conversion Functions —
    - Added the `MAP_PUT`, `MAP_GET`, and `MAP_DELETE` scalar functions that operate on parallel key and value arrays as a practical map in SQL. Store a map as a tuple of a key array and a value array, and use these functions to insert, retrieve, and remove key-value pairs. For details, see **Map Functions**.
- HTTP Query API —

    - When you execute a query using the HTTP Query API that exceeds a service class limit, the database terminates the query with the expected error instead of having the query remain in the `FINALIZING` state indefinitely.
- System Catalog Table Additions —
    - `sys.mcp_tools`
    - `sys.pipeline_metrics_current`
    - `sys.pipeline_metrics_historical`
- System Catalog Table Column Additions —
    - The `sys.pipeline_metrics` system catalog table includes the new `file_index`, `work_unit_id`, `work_unit_attempt`, and `epoch_id` columns.
    - The `information_schema.pipeline_status` and `information_schema.pipeline_table_metrics` views include the `bytes_ingested` column.
    - The `information_schema.pipelines` view includes the `transaction_id` column.
    - The `sys.completed_queries_persistent` system catalog table and the `query.json` output include the new `parent_query_id` column.

**Version Compatibility**

- Data Pipelines are now the preferred method for loading data into the Ocient System. For details, see **Load Data**. The LAT functionality is deprecated and will be removed in a future release.
- A `SELECT` statement without a `FROM` clause that references a column, such as `SELECT c1;`, now returns the error ( `The reference to column 'c1' is not valid` ) instead of resolving the column from the previous default table reference.
- Nested vectors and matrices (vectors or matrices nested inside arrays, tuples, or maps) require Spark connector 1.2.0 or later together with JDBC driver 4.3.0 or later. For details, see **Spark Connector Release Notes**.
- For a new Ocient System, the Ocient Management UI and the HTTP Query API are enabled by default. Previously, you had to open a Connectivity Pool port for the HTTP Query API before either was reachable. For details, see **Configure API Port**.
- The `FEEDFORWARD NETWORK` machine learning model type has been renamed to `MLP` (Multi-Layer Perceptron). The `FEEDFORWARD NETWORK` name is still accepted for

backward compatibility. For details, see **Multi-Layer Perceptron (MLP)**.

- For new Google Cloud Platform deployments, Ocient recommends Z3 instances (for example, `z3-highmem-88`) instead of the N2 instance family, which Ocient will remove in a future release. Existing N2 deployments continue to function. For details, see **Google Cloud Platform Ocient Installation**.

# 27.1

### Release Highlights

- Data Extract Tool —
  - Added the extraction of Parquet files to the data extract tool. For details, see **Data Extract Tool**.
- Data Pipeline Loading —
  - Added the `CREATE TRANSACTIONAL PIPELINE` SQL statement with the optional `START FOREGROUND` clause. This statement creates a transactional pipeline, starts it immediately, and blocks the SQL session until the pipeline completes or fails. On failure, the Ocient System automatically rolls back all uncommitted data. For details, see **Transactional Data Pipelines**.
- JDBC Bulk Loading —
  - Added the S3-compatible object store as an alternative bulk load transport mode. You can now set the `bulkLoadMode` connection parameter to `s3` to stage data through an S3-compatible endpoint instead of SSH or SFTP to Loader Nodes. For details, see **JDBC Bulk Loading** and **JDBC Connection Properties**.

### Features

- Transaction Support —
  - The Ocient System now supports transactions in the database and in the JDBC and pyocient drivers. A transaction groups one or more SQL statements into a single unit of work that the database either commits or discards as a whole. Transactions let you apply a set of related changes together and roll them back

if any statement fails. For details, see **Transactions**. For syntaxes, see **Transactional Control Language (TCL) Statement Reference**.

- Distributed Tasks —
  - Added the `DROP TASK` SQL statement to drop orphaned or completed tasks from the system. For details, see **Distributed Tasks**.
- System Catalog Tables Additions —
  - `sys.pipeline_errors_historical`
  - `sys.pipeline_events_historical`
  - `sys.pipeline_files_historical`
  - `sys.pipeline_metrics_historical`
- System Catalog Column Additions —
  - `transaction_id` and `transaction_prefix_len` columns in both of the `sys.queries` and `sys.completed_queries` system catalog tables
  - `transaction_id` column in the `sys.pipelines` system catalog table
- Information Schema Views Additions —
  - `information_schema.pipeline_status_historical`
  - `information_schema.pipelines_historical`
  - `information_schema.transactional_pipeline_status`

### Version Compatibility

- The `array_to_string` SQL function no longer adds quotes around values of VARCHAR arrays.

# 27.0

### Release Highlights

- Data Pipeline Loading —
  - Added the new **ALTER PIPELINE** SQL statement for schema evolution. You can now modify the SELECT clause of a data pipeline for columns, filters, and transformations without recreating the pipeline.

- Machine Learning Model Updates —
  - Added ensemble models with the Bagging, Boosting, and Stacking models. For details, see **Ensemble Models**.

**Features**

- Data Pipeline Loading —
  - Added the `line_number` metadata key for loading the line number of the file. For details, see **Load Metadata and File-Based Partitioned Data in Data Pipelines**.
  - Added these extract options for delimited formats and CSV:
    - STRIP_FIELD_QUOTES
    - STRIP_ARRAY_ELEMENT_QUOTES
    - TRIM_ARRAY_ELEMENTS
    - For details, see **Delimited and CSV Extract Options**.
- Machine Learning Model Updates —
  - Added the regression version of the Decision Tree model. For details, see **Regression Tree**.
  - Added `featureSubsetStrategy` and `maxCellsToFetch` options to the Random Forest model. For details, see **Random Forest**.
- Data Storage —
  - Added the `DRAIN PAGES` SQL statement to manually migrate data from pages to segments. For details, see the **DRAIN PAGES** statement.
  - Added the `NOINDEX` option for time bucket clauses in `CREATE TABLE` statements. This option prevents a TimeKey® from impacting storage ordering. For details, see **TimeKeys and Clustering Keys**.
  - Added the `ALTER SYSTEM SET DEFAULT STORAGESPACE` SQL statement to enable default storage spaces for tables. For details, see the **ALTER SYSTEM SET DEFAULT STORAGESPACE** statement.
  - Added the `ALTER CLUSTER ADD STORAGESPACE` and `ALTER CLUSTER REMOVE STORAGESPACE` SQL statements to link storage spaces to clusters. For details,

see the **ALTER CLUSTER ADD STORAGESPACE** and **ALTER CLUSTER REMOVE STORAGESPACE** statements.

- CREATE TASK syntax —
  - Added the `LOCATION` and `OPTIONS` keywords to the `CREATE TASK` SQL statement for easier task creation. For details, see **Distributed Tasks**.
- Aggregate Functions —
  - Added these functions to assess the performance of machine learning models:
    - `ACCURACY_SCORE`
    - `COEFFICIENT_OF_DETERMINATION`
    - `CONFUSION_MATRIX`
    - `F1_SCORE`
    - `MEAN_ABSOLUTE_ERROR`
    - `MEAN_ABSOLUTE_PERCENTAGE_ERROR`
    - `PRECISION_SCORE`
    - `RECALL_SCORE`
    - `ROC_AUC_SCORE`
    - For details, see **Aggregate Functions**.
- Scalar Data Conversion Functions —
  - Updated the `BOOLEAN` function to accept new string and numeric values for casting. For details, see **Scalar Data Conversion Functions**.
- Default Expressions —
  - Expanded valid column defaults from exclusively literals to any constant, deterministic expression that the system casts to the target column. For details, see **Column Constraint**.
- Values Expressions
  - You can now use value expressions with the `VALUES` keyword in the `FROM` clause. For details, see the **FROM** clause syntax.
- System Catalog Column Additions —

- `target_rows_per_cycle` and `applied_dynamic_filter_stats` in the `sys.active_operator_instances` system catalog table
- `default_schema` in the `sys.completed_queries` system catalog table
- `begin_timestamp` and `end_timestamp` columns in the `sys.segments` system catalog table
- `begin_timestamp` and `end_timestamp` columns in the `sys.segment_groups` system catalog table
- `scope_prefix_len`, `transaction_timeout`, `creation_timestamp`, and `last_activity_timestamp` in the `sys.storage_scopes` system catalog table
- `default_schema` in the `sys.queries` system catalog table
- `password_days_remaining` column in the `sys.users` system catalog table
- For details, see **System Catalog**.

### Version Compatibility

- The Ocient System now supports non-literal expressions (e.g., arithmetic and deterministic functions) with the `DEFAULT` keyword to specify a default value. The system validates default values and ensures consistent casting. For example, you must now specify a TIMESTAMP default value as `TIMESTAMP DEFAULT 0` or `TIMESTAMP DEFAULT '1970-01-01 00:00:00.00000000'`.

## 26.1

### Release Highlights

- Data Pipeline Loading —
  - The Ocient System now loads data in the Apache® Avro™ format. For details, see **Load Avro Data**. The new `FORMAT avro` extract options are in the syntax of the **CREATE PIPELINE** SQL statement.
- Array Functions —
  - Added the **ARRAY_CAT_DISTINCT** and **ARRAY_DISTINCT** array functions for concatenation and deduplication, respectively.
  - Added the **ARRAY_CONCAT_AGG** sorted aggregate function for concatenation.

- Index Types —
  - Added the `ZONE_MAP` index type to store the range of values present in a segment for the indexed column, enabling queries to skip over entire segments with no rows matching a compatible filter. For details, see the **ZONE_MAP Index Type**.
- HTTP Query API —
  - Added the **Ocient HTTP Query API** endpoint library to enable execution of SQL statements.
- Google® Looker™ Studio Integration —
  - Added the connector for integrating the Ocient System with Looker Studio. For details, see **Looker Connector**.

**Features**

- Data Pipeline Loading Changes —
  - The Ocient System now loads data from HDFS sources. The new source options are in the syntax of the **CREATE PIPELINE** SQL statement. For details, see **Data Pipeline Load of JSON Data from HDFS**.
  - The Ocient System can now load data from HDFS. For the source syntax and options, see the **CREATE PIPELINE** SQL statement. For the tutorial, see **Data Pipeline Load of JSON Data from HDFS**.
  - The data pipeline loading functionality supports the `TO_CHAR` function for converting `VARBINARY` types. For details, see **Character Data Transformation Functions**.
  - Updated the `METADATA` function with:
    - New `key` metadata key to specify the Apache® Kafka® bytes of the Kafka key for the record. For details, see **Load Metadata and File-Based Partitioned Data in Data Pipelines**.
    - New `METADATA('hive_partition',search_string)` syntax for retrieving a value from a key-value pair in the filename metadata using Apache® Hive™ naming standards with a filter set in the file path.
  - Added the `NUM_FOOTER_LINES` option for delimited and CSV formats to skip lines for the footer of the file. For details, see **Delimited and CSV Extract**

**Options**.

- The file-based source `START_TIMESTAMP` and `END_TIMESTAMP` options have been removed for data pipelines.

- General SQL Syntax —
  - Added the `TAG` keyword to add a tag to the SQL query. For details, see the **TAG** syntax.
- Table Retention Policies —
  - Added functionality to add retention policies to table definition statements. For details, see **Table Retention Policies**.
- Schema Database Object —
  - Added the schema database object and its corresponding privileges. For details, see **Data Control Language (DCL) Statement Reference**.
  - You can create, modify, and remove a schema by using the `CREATE SCHEMA`, `ALTER SCHEMA RENAME`, and `DROP SCHEMA` SQL statements, respectively. For details, see **Schemas**.
- Cross-Database SSO Authentication —
  - Enabled SSO-authenticated users to access multiple databases using a single identity provider configuration. For details, see **Set Up Cross-Database SSO Integration**.
  - Added the **CURRENT_GROUPS** function that returns the fully qualified names of groups in the database.
- Query Privileges —
  - Added the VIEW QUERIES, VIEW REDACTED QUERIES, and CANCEL QUERIES privileges in the database. For details, see **Data Control Language (DCL) Statement Reference**.
- System and Database Privileges —
  - Added the DELETE privilege to the system and database objects. For details, see **Data Control Language (DCL) Statement Reference**.
- Machine Learning Model Updates —

    - Added `featureArray` option to all models except Simple Linear Regression, Vector Autoregression, Association Rules, and Feedforward Neural Network models.
    - Added the `normalize` option.
    - Added new options `bootstrap` and `maxChildThreads` to the Random Forest model.
    - Added new options `learningRate`, `numEpochs`, `miniBatchSize`, `gradientClipThreshold`, and `finiteDifferenceH`. These options replace `popSize`, `initialIterations`, `subsequentIterations`, `momentum`, `gravity`, `lossFuncNumSamples`, `numGAAttempts`, `maxLineSearchIterations`, `minLineSearchStepSize`, and `consistentSample` options for Nonlinear Regression, Logistic Regression, Support Vector Machine, and Feedforward Neural Network models.
    - Added new models **Gradient Boosted Trees** and **Regression Tree**.
- Data Type Updates —
    - Array and tuples without specified data types, such as `ARRAY[]`, `ARRAY[NULL]`, and `TUPLE(NULL, NULL)`, are now valid expressions. The Ocient System treats these types as `CHAR[]` for arrays and `TUPLE<<CHAR,CHAR>>(NULL, NULL)` for tuples.
- System Catalog Table Changes —
    - The `sys.pipeline_files` table no longer contains the `stream_source_id` column. The table now contains the `file_index` column.
    - The `sys.columns` table has these new columns:
        - `system` — Boolean value that specifies whether the column is internal
        - `type_hint` — expected type of the column
    - With k-nearest neighbors models, the `machine_learning_models` table returns the `K_NEAREST_NEIGHBORS` value for the `machine_learning_model_type` column.
    - All authenticated users can now view these tables:
        - `sys.nodes`
        - `sys.service_roles`
        - `sys.node_status`

    - `sys.channel_endpoint_parameters`
  - The `encrypted` column has been removed from the `sys.channel_endpoint_parameters` table.

**Version Compatibility**

- Decimal values use rounding instead of truncation when you cast types from DECIMAL or STRING to a lower precision and scale.
- The system automatically grants the DELETE privilege to the creator of database and schema objects for objects created in version 26.1 and later.

# 26.0

Internal updates only.

# 25.5

**Version Compatibility**

- The `||` operator behavior has changed. If you specify a NULL value for concatenation, then the result is NULL.

# 25.2

**Features**

- Data Pipeline Changes —
  - Added the `WHERE` filter keyword to the `SELECT` SQL statement in the `CREATE PIPELINE` statement. For details, see **CREATE PIPELINE**.
  - Added new `HEADERS` Amazon® Web Services℠ (AWS℠) S3 source option for the `CREATE PIPELINE` SQL statement to define the headers to send with every request.
  - Added the `MODE` option to the `PREVIEW PIPELINE` SQL statement. This option indicates whether to perform a validation of the `PREVIEW PIPELINE` statement. For details, see **PREVIEW PIPELINE**.

- Added the `streamloader.extractorEngineParameters.configurationOption.filesystem.access.directories` configuration setting to denote where you can load server file system data. For details, see **Configuration Settings for Data Pipelines**.
- Updated the `METADATA` function with a new metadata key and syntax. For details, see **Load Metadata and File-Based Partitioned Data in Data Pipelines**:
  - The `source_record_id` metadata key indicates a unique source row identifier that is generated by the Ocient System during loading.
  - New `METADATA('hive_partition',search_string)` syntax that uses a search string as a key for searching the filename metadata to return the value from the key-value pair as a string.
- Added these transformation functions. For details, see **Transform Data in Data Pipelines**:
  - `IF` — Evaluate an expression for `true` or `false`.
  - `CASE WHEN` — Return a result value based on whether an expression is `true`.
  - `ELEMENT_AT` — Returns the element value of the array or tuple at the specified index.
  - `MAP_KEYS` — Returns the keys in the specified JSON string.
  - `MAP_VALUES` — Returns the values in the specified JSON string.
  - `REDUCE` — Applies a merge function to a starting value and all elements in the array, and then reduces the array to a single value.
- System Catalog Table Changes —
  - Added Boolean parameter `scopes_on_refresh` to the `sys.oidc_integrations` system catalog table to include or not include scopes when submitting a refresh token request.

# 25.1

### Features

- New data pipeline transformation function `ARRAY_CONTAINS` determines whether an array contains the specified value, including NULLs.
- System Catalog Table Changes —
  - The `record_number` column of the `sys.pipeline_errors` system catalog table is now the index, which starts at 1, of the processed record relative to the source file (or Kafka partition) where the record was extracted.
  - The `record_offset` column of the `sys.pipeline_errors` is now the offset of 1 for the processed record relative to the start of the source file for files with contiguous records, -1 for files with non-contiguous records (i.e., Parquet), and the Kafka offset for Kafka loads.

# 25.0

### Release Highlights

- Load Data into the Ocient System — The new way to load data into the Ocient System is to use Data Pipeline functionality. This functionality supports loading data from multiple formats such as CSV, JSON, and Parquet. Data pipelines support data transformation during the load. You can load multiple data formats, including geospatial data. This functionality supports these new syntaxes:
  - `CREATE PIPELINE` SQL statement to create a data pipeline.
  - `DROP PIPELINE` statement to remove a data pipeline.
  - `PREVIEW PIPELINE` statement to view the results of a data load before creating the data pipeline.
  - `START PIPELINE` statement to start the execution of the data load.
  - `STOP PIPELINE` statement to stop the execution of the data load.
  - `ALTER PIPELINE RENAME` statement to rename a data pipeline.
  - `EXPORT PIPELINE` statement to return the `CREATE PIPELINE` SQL statement used to create the specified data pipeline.
  - `CREATE OR REPLACE PIPELINE FUNCTION` statement to define your own data pipeline function for loading data.
  - `DROP PIPELINE FUNCTION` statement to remove the data pipeline function.
  - For details, see **Load Data** and **Data Pipelines**.

### Features

- Java® Runtime Environment — The Ocient System installation requires Java 21, where the `openjdk-21-jre-headless` package is recommended.
- Persistent Data — Data persists in the system storage space of the Ocient System in system catalog tables such as the `sys.completed_queries` table. For details, see **Storage Space Settings**.
- Default Compression Scheme — The default compression scheme for variable-length columns is `NONE`.
- Set more granular privileges for database and system objects. For details, see **Object-Type Level Privileges Management** and **Data Control Language (DCL) Statement Reference**.
- The `SHOW SYSTEM TABLES` SQL statement displays the system catalog tables.
- System Catalog Table Changes —
  - `information_schema.tables` has a column `table_type` with two new types: `SYSTEM TABLE` for system catalog tables and `SYSTEM VIEW` for information schema tables. `BASE TABLE` and `VIEW` still exist for user-defined tables and views.
  - `sys.system_tables` has new columns: `schema`, `type`, and `description`.
  - `sys.segment_groups` has the new `depth` and `visibility` columns.
  - `sys.stored_segments` has the new `abnormal_placement` column.
  - `sys.completed_queries` contains persistent data. The system experiences a small loading delay between completing the execution of a SQL query and when the corresponding results appear in the table.
  - The definition for the `sys.queries` table has been updated to remove these columns:
    - `time_start`
    - `time_optimization_start`
    - `time_execution_start`
    - `time_first_byte_sent`
  - The definition for the `sys.queries` table has been updated to change the data type of these columns from `LONG` to `TIMESTAMP`:

    - `timestamp_start`
    - `timestamp_optimization_start`
    - `timestamp_execution_start`
    - `timestamp_first_byte_sent`
- The definition for the `sys.locks` table has been updated for these columns:
    - Renamed `createTime` to `create_time`.
    - Renamed `lastRefreshTime` to `last_refresh_time`.
    - Renamed `priortyId` to `priority_id`.
- Updated column descriptions for these tables:
    - `sys.segment_directories`
    - `sys.addendum_directories`
    - `sys.segment_groups`
    - `sys.segment_parts`
    - `sys.segments`
    - `sys.stored_segments`
    - `sys.service_role_status`
- Updated the data type for the `segment_group_ids` column in the `sys.segment_group_transfers` table from `ARRAY(LONG)` to `ARRAY(CHAR)` because segment group identifiers are unsigned.
- Renamed the `service_roles_id` column in the `sys.service_role_channel_endpoint` table to `service_role_id` to align with the naming in the `sys.service_role_status` table.

**Version Compatibility**

- `sys.built_in_views` has been removed. The built-in views have been removed from `sys.built_in_views`, `sys.views`, and `information_schema.views`. The view information now appears in the `sys.system_tables` system catalog table. `information_schema.views` includes user-defined views and only information schema views.
- `sys.views` no longer has a `view_type` column.

# 24.0

### Release Highlights

- Better SQL Errors: Improved error messages for poorly constructed SQL queries.
- Enhance Build Metadata: Updated Ocient package file names and build information for clarity.
- Improved Tracing: Enabled using the `TRACE` keyword in SQL queries to profile query performance. For details, see the **TRACE** keyword.
- Large Blobstore Support: Enabled more than 2TiB of data to spill per disk for high-density drive situations.
- Large Drive Support: Added support for drives up to 15.36TB in size per node.
- Rebalance System: Added the `REBALANCE` task, which enables optimization of query efficiency by transferring data around the system until nodes are roughly balanced in terms of data volume per node. For details, see **Rebalance System**.
- System Storage Space: Added support for multiple storage spaces and enabled the creation of a system storage space for internal Ocient System data.
- Workload Management Usability:
  - Added support for assigning service classes to queries based on query text. For details, see the **CREATE SERVICE CLASS** SQL statement.
  - Added support for changing the priority for queries. For details, see the **ALTER QUERY** SQL statement.

### Features

- [DB-19266]: Network Configuration —
  - All nodes must now belong to a connectivity pool. Manage connectivity pools using these new SQL statements. For details, see **CONNECTIVITY POOL**.
    - `CREATE CONNECTIVITY_POOL` to create a connectivity pool.
    - `DROP CONNECTIVITY_POOL` to drop a connectivity pool.
    - `ALTER CONNECTIVITY_POOL SET` to set the metadata of a connectivity pool.
    - `ALTER CONNECTIVITY_POOL RENAME TO` to rename a connectivity pool.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

        - `ALTER CONNECTIVITY_POOL ADD PARTICIPANTS` to add nodes to a connectivity pool.
        - `ALTER CONNECTIVITY_POOL DROP PARTICIPANTS` to remove nodes from a connectivity pool.
    - The `ALTER NODE SET ADDRESS` SQL statement changes the internal IP address for a node. For details, see **ALTER NODE SET ADDRESS**.
    - You can now configure the network of an Ocient System. For details, see **Manage the Network Configuration of an Ocient System**.
    - Redirects now occur only within connectivity pools. When you upgrade an Ocient System, you must first configure a connectivity pool.
- [DB-28986]: System Catalog Table Updates —
    - Renamed `client_version` to `protocol_version` in the `sys.queries` and `sys.completed_queries` system catalog tables.
    - Added `driver_version` column to the `sys.queries` and `sys.completed_queries` tables.
- [DB-29788]: Regular Expression Functions —
    - Added new functions that use regular expression search patterns. The new functions are:
        - **REGEXP_COUNT**
        - **REGEXP_INSTR**
        - **REGEXP_REPLACE**
        - **REGEXP_SUBSTR**

### Version Compatibility

- The `bootstrap.conf` no longer supports `highspeedAddress` as an advanced system configuration option. For other options, see **Node Bootstrapping Reference**.
- The default behavior for the `UNNEST` function no longer uses the `NULL_INPUT` clause for a multi-item `SELECT` list. If you would like to utilize the default behavior from version 23.0 and prior, you may do so by changing `ALTER SYSTEM ALTER CONFIG SET sql.unnestLegacySelectListBehavior = 'true'`.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

### Feature Removal

- Removed `COMPRESSION LZ4` from the compression options. This compression scheme remains in use as part of `COMPRESSION DYNAMIC` for variable-length columns.
- Removed the table-valued function `REPLACEMENT_JOIN`. For creating compressed lookup tables, see **Global Dictionary Compression**.
- Particle swarm optimization functionality has been removed from the Ocient System.
- ODBC connection has been removed from the Ocient System.

## 23.0

### Release Highlights

- All machine learning functionality is available to use. For details, see **Machine Learning Model Functions** and **Machine Learning in Ocient** to get started.
- Delete Syntax: Enabled the deletion of individual rows in the database.
- Integrations: Added drivers and support for the following third-party applications:
  - DBeaver
  - Tableau®

### Features

- [DB-13607]: Delete Syntax — Added the SQL DELETE statement syntax that enables the deletion of individual rows in the database.
- [DB-18020]: Large Geospatial Types — Increased the size of `LINESTRING` and `POLYGON` geospatial data types to 512 MB. For details, see **Load Geospatial Data**.
- [DB-19048]: Geospatial Index — Added the SPATIAL index type for indexing geospatial data. For details, see **SPATIAL Index Type**.
- [DB-18280]: Connectors Refresh — Added integration with DBeaver and Tableau. For details, see **DBeaver Integration** and **Tableau Integration**.

© 2026 Ocient, Inc

- [DB-20412]: Multi-Cluster Loading and Cluster of Clusters — Added support for loading and working with multiple clusters. For details, see **Multiple Storage Clusters for Loading Data**.
- [DB-21609]: Machine Learning Model Updates —
  - Added the **Gaussian Mixture Model**.
  - Added the **Association Rules Model**.
  - Added the **Linear Discriminant Analysis Model**.

### Version Compatibility

- Large Geospatial Types are not backwards compatible with earlier releases. For details, see **Version Compatibility**.
- The database data control language (DCL) denotes user role privileges to remove data using the `DELETE` keyword instead of `TRUNCATE`.

## 22.0

### Release Highlights

- HyperLogLog (HLL): Added HLL sketch functionality.
- Information Schema: Added the `information_schema` schema that shows system metadata.
- Integrations: Added drivers and support for the following third-party applications:
  - Metabase℠
  - SQLAlchemy
  - Apache® Superset®

### Features

- [DB-13603]: Information Schema — Added the information_schema schema that shows system metadata in an accessible format.
- [DB-20484]: Superset Integration — Merged sqlalchemy-ocient driver into Superset repository, allowing Superset to support Ocient database connections.

- [DB-20484]: SQLAlchemy Integration — Published sqlalchemy-ocient driver to PyPI℠.
- [DB-21011]: EXCEPT Clause — Added EXCEPT clause so that SELECT * queries can explicitly omit columns from results.
- [DB-21769]: Metabase Integration — Added Ocient as a Metabase partner driver, allowing Metabase to access Ocient databases out-of-the-box.
- [DB-23030]: JDBC Packaging — Removed OpenJump dependency from ocient-jdbc4.
- [DB-23175]: Time Zone Adjustment Support — Added various improvements to time zone functionality, including:
  - Support for daylight savings adjustment based on time zone.
  - Added time zone functions CONVERT_UTC_TIMESTAMP_TO LOCAL and CONVERT_LOCAL_TIMESTAMP_TO_UTC. For more information, see **Time Zone Functions**.
  - Enhanced performance for time zone conversion.
- [DB-23177]: Push-Down Aggregation to the I/O Layer — Under certain conditions, the system pushes aggregation to the I/O operator for better efficiency and performance.
- [DB-23299]: HLL Sketch Functionality — Added support for variable log2k HLL sketch algorithm and associated functions. For details, see the **HLL Functions page**.
- [DB-23745]: Implement Evacuate Node — Evacuate node is a tool to move all segments off of a node in a system that is overprovisioned to the other nodes in the cluster. This tool is useful when you replace drives or a node.
- [DB-19888]: Machine Learning Model Updates —
  - The Ocient System scopes machine learning models to schemas. The system assigns the `pre_v22_mlmodel` schema to any model you created prior to version 22.0.
  - The `sys.multiple_linear_regression_slopes` system catalog table has been removed.
  - Rename machine learning models using ALTER MLMODEL.
  - New DDL commands:

    - CREATE OR REPLACE
    - REFRESH
    - EXPORT
- For details about the new syntaxes, see **Machine Learning Model Functions**.

### LAT Features

- [LAT-1469]: Manual Configuration of LAT Endpoints — Enabled manual configuration of LAT endpoints for OAuth with OKTA®.
- [LAT-1475]: Enablement of Stopping Load Processing During Error Condition — Added default behavior to stop processing during file loading in the event of an unrecoverable error when the system extracts records from a file. For details, see **continue_on_unrecoverable_error**.
- [LAT-1476]: Enablement of LAT Service in Installation — Enabled LAT Service in `systemd` by default upon installation completion. This update reflects a change in the default behavior during installation.
- [LAT-1477]: LAT Version for Metrics — Exposed `lat_version` in the metrics.
- [LAT-1557]: Support for Loading Multiple S3 Buckets — Added LAT functionality to load data from multiple S3 buckets simultaneously within the same pipeline.

### Version Compatibility

- Information Schema — Views created prior to Version 22.0 do not have column data appearing in the information_schema. You can drop and recreate these views to populate column data.
- LAT — Version 3.0.0 and greater is only compatible with Version 22.0 and greater of the Ocient system. For details, see **Version Compatibility**.

## 21.0

### Release Highlights

The Ocient System now supports the following operating systems:

- Ubuntu® 20.04

- Debian® 11
- Red Hat® Enterprise Linux® (RHEL®) 8

Other highlights include:

- Whole column compression: Added Zstandard (ZSTD) compression for fixed and variable length columns.
- Check system configuration: Added `precheck` and `postcheck` commands to check system configuration before and after installation.
- Workload management dynamic priority: Enabled the adjustment of the query priority dynamically at the session, service class, and query levels.
- Ability to quiesce node: Added process for graceful node shutdown.

**Features**

- [DB-18636]: ZSTD Compression - Added a new whole-column compression scheme (ZSTD) that can be enabled for fixed and variable length columns.
- [DB-18990]: Improved Stats Storage And Usage - Various improvements have been added to speed up the fetching of statistics by the optimizer and ensure it gets up-to-date statistics. These changes primarily center around probability density functions being stored as pre-aggregated stats files instead of on a per-segment basis.
- [DB-20190]: Distributed Tasks - Added `check_disk` task type and new vtables `sys.subtasks`, `sys.tasks`, and `sys.rebuild_tasks` for monitoring tasks. Remove `CHECK DATA` command.
- [DB-19117]: Metadata - Added `participating_nodes` to the `sys.queries` and `sys.completed_queries` virtual tables.
- [DB-18633]: Graceful Node Shutdown - Added quiesce process for graceful node shutdown.
- [DB-18061]: LCK Deprecation - Added new disk data format that is smaller and also improves performance of some index based queries.
- [DB-19414]: Range Query Improvement - Improved performance of range queries by utilizing the inverted secondary index.
- [DB-20168]: Geospatial Function Expansion - Added these geospatial scalar functions.

- Measurement Functions
  - ST_ANGLE
  - ST_DISTANCESPHERE
  - ST_DISTANCESPHEROID
  - ST_LENGTH2D
  - ST_HAUSDORFFDISTANCE
- Analytic and Property Functions
  - ST_DIMENSION
  - ST_GEOHASH
  - ST_SRID
  - ST_ISPOLYGONCW
  - ST_ISPOLYGONCCW
- To String and Binary Functions
  - ST_ASWKT
  - ST_ASWKB
  - ST_ASEWKT
- Geography Simplification Function
  - ST_SIMPLIFY
- Constructor Functions
  - ST_POINTFROMGEOHASH
  - ST_GEOGPOINT
  - ST_MAKEPOLYGONORIENTED
  - ST_POINT_FROMEWKT
  - ST_LINESTRING_FROMEWKT
  - ST_POLYGON_FROMEWKT
  - ST_MAKEENVELOPE
- Additionally, you can construct ST_POLYGON types directly from a POINT[] without going through an intermediate ST_LINESTRING.

### Keywords

Added these new keywords as reserved words in the Ocient system.

- ANALYSIS
- AUTOREGRESSION
- BAYES
- CANCEL
- COMPONENT
- DECISION
- DISABLE
- DISABLE_STATS_FILE_UPDATES
- ENABLE
- FEEDFORWARD
- INSERT
- KMEANS
- KNN
- LOGISTIC
- MACHINE
- MOVE
- NAIVE
- NETWORK
- NONLINEAR
- PRINCIPAL
- REPLACE
- SOURCE
- SUPPORT
- TREE
- VECTOR
- ZSTD

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

# 20.0

### Release Highlights

- CREATE TABLE AS SELECT SQL Statement: Extract, load, and transform (ELT) workflow functionality to extract data and load it into a new database table by using the query results from a SELECT SQL statement. The tables you create using the CREATE TABLE AS SELECT SQL statement have some indexing limitations in version 20.0. For details, see the “About Create Table As Select (CTAS)” section of the Ocient user documentation.
- INSERT INTO SQL Statement: ELT workflow functionality to extract data and insert it into an existing database table using the INSERT INTO SQL statement.
- N-gram Indexes: Full index on VARCHAR, VARCHAR arrays, and VARCHAR tuple components for efficient queries using the LIKE SQL statement.
- Large VARCHAR [DB-16142]: Support VARCHAR columns up to 1GB in size.
- Ocient Simulator: An instance of the Ocient system for data loading and functional testing.
- Single Sign-On (SSO): Authenticate access to Ocient through an external SSO server and assign SSO users to groups in Ocient.

### Feature Removal

The ALTER ROLE DDL command has been removed. You can make all changes using the ALTER CONFIG SQL statement. To alter a role, prefix the key with the role name followed by a dot.

The following system tables have been added:

- average_bb_sizes
- linear_combination_regression_models
- node_config
- node_status
- sso_connections
- storage_device_status

The following system tables have been removed:

- hugepage_configurations
- memory_module_models
- node_memory_modules
- oidc_integrations
- oidc_sessions
- polynomial_regression_models
- security_integrations
- sessions

# 19.0

### Features

- [DB-14527] - Adaptive Water Mark Feature - Indexer Node dynamically increase and reduce batch size without manual tuning
- [DB-14656] - Added a rest endpoint to expose a node’s configuration parameters (:9090/v1/configparams)
- [DB-15123] - Expose cluster total storage space and storage usage through virtual tables
- [DB-15515] - Add support for expr::dtype cast notation
- [DB-16289] - Remove the web ui and YAML service role configuration
- [DB-16904] - Allow any predicate type to be used in conjunction with the values in arrays
- [DB-17889] - Improve ability to continue data loading when a foundation node is down
- [DB-18393] - Leverage hyperthreading in query execution
- In v19 the service role configuration previously set through the web UI has been replaced by the ALTER … ALTER ROLE/CONFIG … DDL command. The web UI is still available in v19, but will be removed in a subsequent release. The ALTER … ALTER ROLE/CONFIG … command should be used to change system configuration, rather than the web UI. Please reference the Upgrade Ocient Software section of the user documentation for details.

© 2026 Ocient, Inc

- [DB-12747] - Add support for lateral joins.
- [DB-13924] - Add support for multi-column subqueries.
- [DB-14990] - Add support for native right joins.
- [DB-15996] - Add support for array_to_string function.
- [DB-16231] - Improve GIS function performance and introduce expanded support for GIS functions. Please refer to the User Documentation for details.
- [DB-17037] - Add new scalar functions and operators added for GIS types (POINT, LINESTRING, and POLYGON). Please refer to the User Documentation for details.
- [DB-17892] - Add support for right lateral joins.
- [DB-16061] - Secondary indexes can now be created on VARCHAR and VARCHAR[] columns. Please refer to the User Documentation for details.

# 18.0

### Features

- [DB-17635] - Remove query log properties timestamp_optimizationcomplete and time_optimizationcomplete and add new properties timestamp_optimizationstart and time_optimizationstart
- [DB-16567] - Make error messages more clear for queries with GroupBy missing
- [DB-17316] - Change array_length(empty array) to return 0
- [DB-16417] - Allow for integral types for integer field is GIS functions
- [DB-16200] - Make Explains more convenient for the user.
- [DB-16092] - Distributed Result Set Caching
- [DB-15623] - Add support for rebuilding individual nodes via DDL
- [DB-15375] - ALTER CLUSTER ADD PARTICIPANTS DDL
- [DB-14720] - Provide a way to kill long running optimizations
- [DB-14017] - Support for CLI command history across sessions

# 17.0

### Features

- [DB-12888] - Add support for array values larger than 128 KB. The new maximum value of an array is 512 MB.

# 16.0

### Features

- [DB-10329] - Add support for full disk encryption of Opal drives. Disk encryption will be automatically enabled when Opal support is detected.

# 14.0

### Features

- [DB-14159] - Default hex values for binary or varbinary columns must contain a leading 0x

# 13.0

### Features

- [DB-14330] - Remove last dependencies on PostgreSQL® from the database

# 12.0

### Features

- [DB-13334] - Add support for zip unnest, which unnests multiple arrays in parallel

# 11.0

### Features

- [DB-12887] - Add support for the array of tuples. Users can create array columns containing tuple SQL types. Please refer to the User Documentation for the latest information on supported data types.

- [DB-12885] - Add support for unnest(), which expands array elements from input array columns out to individual output rows

# 10.0

### Features

- [DB-12394] - Added support for running on CentOS® 8.

# 9.0

### Features

- [DB-13162] - Added support for Tasks to the System Catalog
- [DB-10332] - Implemented access controls on system and database-level objects. Improved users, groups, and added new roles within Ocient.
- [DB-12829] - Optionally enforce encrypted connections for JDBC and ODBC.

# 8.0

### Features

- [DB-10330] - External Network Security. SSL/TLS support in ODBC and JDBC, SSL support for the web interface.

# 7.0

### Features

- [DB-10921] - Adds support for multi-dimensional arrays and the ability to do joins, windows, sorts and aggregations that involve arrays.
- [DB-10927] - Adds support for global dictionary compression (GDC) on VARCHAR array columns and the ability to do replacement joins.
- [DB-10282] - Adds support for DROP COLUMN DDL to remove columns from a table.
- [DB-11472] - Adds support for skipping failed rows for CSV loading up to some specified threshold.

# 6.0

### Features

- [DB-9707] - Scriptable Bulk Load Essentials: Allows users to create translations and launch bulk load tasks via DDL
- [DB-10479] - Adds support for Tableau through Ocient’s JDBC Custom Connector. Users can find Ocient’s connector and the installation instructions on Tableau’s extension gallery. Please refer to Tableau for more inforamation.

# 5.0

### Features

- [DB-9477] - Adds support for the array data type. Users can create single-dimensional array columns from any other supported data type. Please refer to the User Documentation for the latest information on supported data types.
- [DB-9656] - Add column support. The engine now supports the add column DDL statement with the ability to add columns to an existing table. Existing data that was loaded without the new column uses the configured default values when queried. Please refer to User Documentation for information on the DDL syntax and default values.

# 4.0

### Features

- [DB-6386] - Availability of the storage engine, allowing queries to run with a node or drive failure
- [DB-6588] - Bulk loading of CSV files from HDFS or an S3 endpoint
- [DB-7221] - Delta compression in the TKT engine for timestamp columns
- [DB-7623] - Virtual tables to retrieve information from the storage cluster state
- [DB-7247] - OS Upgrade functionality
- [DB-6125] - AWS initial support
- [DB-6383] - Data Definition Language (DDL) operations

© 2026 Ocient, Inc

- [DB-6940] - All system configuration in the System Catalog
- [DB-6362] - Stats Virtual Tables
- [DB-7098] - External Window Operator support
- [DB-7497] - List Running Tasks Page
- [DB-7097] - Segment Group Deletion
- [DB-7139] - Cancel Query and Cancel Task support
- Numerous stability and performance improvements

© 2026 Ocient All Rights Reserved Terms Of Use Privacy Statement

# JDBC Release Notes

Release notes for the Ocient JDBC driver, including new features, bug fixes, compatibility changes, and upgrade guidance for each driver version.

All Ocient® JDBC drivers are located the **Maven Central repository**.

## 4.3.1 (2026-09-24)

Internal updates only.

## 4.3.0 (2026-08-04)

Internal updates only.

## 4.2.2 (2026-07-17)

Internal updates only.

## 4.2.1 (2026-06-26)

Internal updates only.

## 4.2.0 (2026-06-16)

- Added transactional support. You can now group multiple statements into a single transaction by disabling autocommit and ending the transaction with the `COMMIT` or `ROLLBACK` command. For details, see **Commands Supported by the Ocient JDBC CLI Program**.
- Added the `PLAN EXECUTE FILE` command, which executes a query plan read from a local file. This command is the file-based counterpart to the `PLAN EXECUTE INLINE` command, and avoids the CLI input parsing overhead for large plan files. For details, see **PLAN EXECUTE FILE**.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

## 4.1.0 (2026-04-01)

- Updated the input parameter for the `CANCEL` and `KILL` commands to be a quoted string for the Universally Unique IDentifier (UUID), such as `'c87b506f-66d6-4987-8bf7-1fd4a06b64b1'`.
- Added these new connection properties: `bulkLoadSshHostKeyVerification`, `bulkLoadSshKnownHostsPath`, and `maxRowsPerInsertBatch`. For details, see the **JDBC Connection Properties**.
- You can now configure JDBC CLI configuration options for the `PERFORMANCE` and `TIMING` commands. For details, see the **JDBC Manual**.
- Added these new extract options to the Data Extract Tool. For details, see **Data Extract Tool**:
  - FILE_PREFIX_EXISTS
  - FILE_TYPE
  - NUM_FETCH_QUERIES
  - PARTITION_MODE
  - PARTITION_COLUMNS
  - SUCCESS_MARKER
  - TARGET_FILE_SIZE_MB

## 4.0.0 (2026-02-05)

- Added the Apache® Spark™ Connector that enables the Ocient System for Spark workloads. The connector allows Spark to read from and write to Ocient tables using Spark APIs and SQL statements. For details, see **JDBC Spark Connector**.
- Enabled SSO-authenticated users to access multiple databases using a single identity provider configuration.
- Added graph functionality using the `OCGraph` Java® class. For details, see **OCGraph Java Library**.

## 3.7.0 (2025-11-21)

- Added quotes around `VARCHAR` data types in tuples and changed delimiter characters to parentheses. Now, the tuple output is `("foo", 5)` instead of `<<foo, 5>>`.

## 3.6.7 (2025-10-11)

- CLI is no longer replacing or removing any whitespace characters inside quoted fields.

## 3.6.6 (2025-10-01)

- Enabled the `source` command to handle files containing the `connect to` command.

## 3.6.5 (2025-09-25)

Internal updates only.

## 3.6.4 (2025-09-10)

- Added the `printUuid` setting to the `.ocient-cli-configuration` file that determines whether the CLI automatically prints the Universally Unique IDentifier (UUID) of the query after the submission of the query by the user. The values are `on` and `off`. If you do not specify this setting, the default value is `off`.
- Re-enabled asynchronous updates. Now, the system executes updates asynchronously by default.

## 3.5.1  (2025-06-16)

- Disabled asynchronous updates.

## 3.5.0 (2025-06-07)

- Added support for asynchronous updates, enabling you to retrieve the query identifier immediately after executing the SQL statement instead of when it finishes on the server. Now, you can use Ctrl-C to cancel the update at the command line.

- Added support for graph algorithms using vertex and edge table representations. These algorithms cover the same capabilities as GraphX from Apache Spark.
- Added the `DISTRIBUTE_WORK` connection parameter, which distributes queries or commands between all endpoints in a round-robin way, instead of relying on server-side load balancing.

## 3.4.1 (2025-05-14)

- New Features
  - Changed the default value for the `path-style-access` extract option to `true`.

## 3.4.0 (2025-04-30)

- New Features
  - Removed quotes added during the extract around `VARCHAR` data types inside arrays by default. Added the `QUOTE_ARRAY_VARCHARS` option for the extract that, when you set the value to `true`, adds those quotes back.
  - Removed the leading forward slash from IP addresses extracted from the database.
  - Added periodic polling of the `.ocient-cli-configuration` file, so the system applies changes to the settings in the file at runtime. The default interval is 5 minutes. You can change the default value by setting the `com.ocient.cli.config-poll-interval` system property to the chosen number of seconds.
  - Fixed the CLI result set output from formatted to a raw string.

## 3.3.1 (2025-03-30)

Internal updates only.

## 3.3.0 (2025-03-06)

- New Features

- Added the specification of the identity provider in the connection string when connecting to the database.
- Added support for the bzip2 and xz compression.
- Added support for multi-line Apache® Groovy™ definitions in SQL statements.
- Changed the default SSO callback address to `http://localhost:7050/ocient/oauth2/v1/callback`.
- Added the `ssoNumericAddress` parameter to force the client to use the IP address `127.0.0.1` instead of `localhost` when you set this parameter to `true`.
- Enabled switching the metrics target directory without having to restart the CLI session.
- Added support for line and block comments in multi-line SQL statements.

## 3.2.4 (2025-01-03)

Internal updates only.

## 3.2.3 (2024-12-13)

Internal updates only.

## 3.2.2 (2024-11-08)

Internal updates only.

## 3.2.1 (2024-09-30)

- New Features
  - Changed the default escape character for quotes in VARCHAR arrays from `\` to `"` for extracts.
  - Added connection property to redact usernames and SQL text in JDBC logs.
  - Increased security for passwords in the command-line interface and history file.

## 3.1.7 (2024-06-03)

Internal updates only.

## 3.1.6 (2024-06-03)

Internal updates only.

## 3.1.5 (2024-06-03)

**Bugs**

- [DB-28722]: Fixed the issue where the client closed the result set before sending the KILL_QUERY request.
- [DB-28325]: Fixed an underlying SLF4JLogger error that prevented the driver from importing.
- [DB-24984]: Fixed HTTP client configuration to accept standard cookie specifications.

## 3.1.1 (2024-03-08)

- *New Features*
  - Enabled support of fetching cached queries using the JDBC 3.1.1 driver with version 22.1 and older versions of the OcientAIQ™ Unified Data Platform.
  - Fixed connection failures by adding sequence numbers to metadata responses on the client side for legacy databases without sequence number support.

## 3.1.0 (2024-01-31)

- *New Features*
  - Improved maximum throughput between client and server, specifically for transferring large and sorted result sets.
  - Deprecated `com.ocient.jdbc.XGConnection#redirect`. The redirect method in the `com.ocient.jdbc.XGConnection` class is now deprecated and is slated for removal in future releases. For applications that require a connection to a

specific SQL Node, Ocient recommends to use the `force=true` connection property.

## 3.0.0 (2023-10-24)

- *New Features*
  - Improved scalability for high-volume concurrent database connections for applications such as Metabase℠ and Superset.
  - Improved latency for bulk data transfers.

## 2.106 (2023-06-29)

- *New Features*
  - Fixed requirement to restart the Java application after cluster upgrade.

## 2.105 (2023-03-22)

- *New Features*
  - Improved performance by pooling database connections used for sideband channels.
  - Added `MAX_THREADS_PER_RESULTSET` connection property.

## 2.100 (2023-03-10)

- *New Features*
  - Added ability to periodically log metrics to a file.
  - Added `METRICS ON <alphanumeric>` CLI command.

## 2.99 (2023-01-24)

- *New Features*
  - Added `PERFORMANCE NETWORK` CLI command.
  - Added `PERFORMANCE DATABASE` CLI command.

© 2026 Ocient, Inc

- Deprecate `PERFORMANCE ON` CLI command.

## 2.98 (2023-01-17)

- New Features
  - Removed OpenJump system dependency

## 2.97 (2022-12-27)

- New Features
  - Added support for `DELETE FROM`

## 2.96 (2022-12-21)

- New Features
  - Fixed `IndexOutOfBoundsException` in server redirect

## 2.95 (2022-12-07)

- New Features
  - Log stack trace of `XGStatement#sendAndReceive()` read errors

## 2.94 (2022-12-07)

- New Features
  - Allow extract to `/dev/null`

## 2.93 (2022-11-28)

- New Features
  - Strip trailing statement delimiter from queries

## 2.92 (2022-11-22)

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

- New Features
  - Include `jdbc.sql.Driver service in META-INF`

## 2.91 (2022-11-22)

- New Features
  - Add support for `REFRESH MLMODEL` command, which allows updating of a Machine Learning model without changing the ML model properties

## 2.90 (2022-11-22)

- [DB-22501] Never resubmit queries that have been sent to the server

## 2.89 (2022-11-18)

- Add support for EXPORT MLMODEL command

## 2.88 (2022-11-08)

- Load JDBC version from build properties file at runtime

## 2.87 (2022-11-07)

- Set Service Class

## 2.86 (2022-10-24)

- Allow connection property override

## 2.85 (2022-10-24)

- Address CVE-2022-33980 and CVE-2022-24823

## 2.84 (2022-10-24)

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

- Print hex instead of address of byte array in XGTuple#toString

## 2.83 (2022-10-18)

- Re-enabled ability to override a connection property
- Fix query timeouts which were not being honored
- Handle non-resolvable database DNS names received from the database

## 2.82 (2022-10-14)

- Made JDBC Connection properties case-insensitive using a new class CaselessProperties
- Converted the rest of the connection properties to the ConnectionProperty enum

## 2.81 (2022-10-03)

- Implement XGPreparedStatement#setObject(Index, Timestamp, Calendar)
- Add “statementPooling” driver property. Set to “OFF” to disable statement caching

## 2.80 (2022-10-03)

- Add `GET JDBC COMMIT INFO` command
- Add `/version`, `/commit`, `/info`, and `/pid` metrics endpoints

## 2.79 (2022-10-03)

- Ensure backwards compatibility with JRE8

## 2.78 (2022-09-19)

- Add CLI support for `EXPORT PIPELINE`

## 2.77 (2022-09-19)

- Add `START PIPELINE` and `STOP PIPELINE` for updates

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

## 2.76 (2022-09-02)

- Made `SHOW` command work as a SELECT outside of just the CLI

## 2.75 (2022-09-02)

- Made `SHOW` command a select command rather than an update command

## 2.74 (2022-08-29)

- `BENCHMARK` command consumes result set for consistency w/ manual input

## 2.73 (2022-08-26)

- New Features
  - Add support for `SHOW` command, which allows easy querying of the information schema.

## 2.72 (2022-08-23)

- New Features
  - [DB-20912] Add support for one-time password (OTP) based SSO flows
  - [DB-20912] Add OAuth2 Authorization Code w/ PKCE Single Sign-On Flow
  - [DB-20912] Add OAuth2 Device Authorization Grant Single Sign-On Flow for input constrained environments

## 2.71 (2022-08-23)

- New Features
  - Add `BENCHMARK NSAMPLES COMMAND` which will run `COMMAND` `NSAMPLES` times and produce a timing report in the CLI output.
  - Add `PRINTUUID [ON | OFF]` which will print the query UUID to the CLI output.

## 2.70 (2022-08-11)

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

- New Features
  - [DB-21078] Add `s3_upload_part_size` and `s3_upload_part_parallelism` extract configuration properties.

## 2.69 (2022-08-11)

- New Features
  - [DB-21078] Add REST endpoint to expose query and data extract performance metrics
  - [DB-21078] Add ms precision to JDBC log entries

## 2.68 (2022-08-09)

- New Features
  - [DB-21251] Allow extract property override via “JDBC_EXTRACT_*” prefixed environment variable

## 2.67 (2022-06-30)

- New Features
  - Allow aliases on nested queries in extract SQL statements (DB-21075)

## 2.66 (2022-06-27)

- New Features
  - Escape escape characters in quoted field for non-comma delimited extracts

## 2.65

- New Features
  - Add support for using `CANCEL TASK` to cancel a task instead of treating it like a `CANCEL` command

© 2026 Ocient, Inc

## 2.64 (2022-06-21)

- New Features
  - Resolve CVE-2022-24823; update netty-common version (4.1.77.Final)
  - Resolve CVE-2021-43797; update netty-codec-http version (4.1.71.Final)

## 2.63 (2022-06-01)

- New Features
  - Replace `skip_header` with `header_mode` in CSV extract options.
  - Add CLI configuration file, `~/.ocient-cli-configuration`, and idle timeout option `cliIdleTimeoutMinutes`

## 2.62 (2022-06-01)

- New Features
  - Add `escape_unquoted_values`, `input_escaped`, and `quote_all_fields` in CSV extract options.
  - Add a new custom TSV writer that handles all non-comma delimiter cases.

## 2.61 (2022-05-31)

- New Features
  - Add `compression_block_size`, `compression_level`, and `num_compression_threads` Data extract properties.

## 2.60 (2022-05-24)

- New Features
  - Allow non-query commands to print results when performance mode is turned on for easier debugging.

## 2.59 (2022-05-17)

- New Features
  - Add UTF-8 character translation to Data extract tool.

## 2.58 (2022-4-20)

- New Features
  - Prevent shell expansion of `!` when reading user input from CLI

## 2.57 (2022-3-17)

- New Features
  - Bumped protocol version for quiesce
  - Modified length checks to check if higher order bit is set, signalling a message from the server

## 2.56 (2022-3-15)

- New Features
  - Added SQL states for EXECUTE_PLAN_AUTH_FAILURE and EXECUTE_INLINE_PLAN_AUTH_FAILURE

## 2.55 (2022-3-11)

- New Features
  - Reconnect and rerun if writing into socket fails when sending request
  - Reconnect and rerun if when sending request, shows -1 length
  - Added checks for -1 length on response for server signalling a quiescing connection close
  - Copy secondary interfaces and secondary index when returning a cached connection

## 2.54 (2022-3-9)

- New Features
  - Added CLI support for SET ADJUSTFACTOR, ADJUSTTIME
  - Added new columns in system queries: sys.queries: initial_priority, initial_effective_priority, effective_priority, priority_adjust_factor, priority_adjust_time sys.completed_queries: initial_priority, initial_effective_priority, final_effective_priority, priority_adjust_factor, priority_adjust_time

## 2.53 (2022-2-8)

- New Features
  - Added redirect support for execute export, explain pipeline, check data

## 2.52 (2022-1-18)

- New Features
  - Secondary result set threads will start fetching immediately after the first result set thread gets a ping.

## 2.51 (2022-1-14)

- New Features
  - Make force external consistent with other connection parameters

## 2.50 (2022-1-13)

- New Features
  - Fix invalid argument message to not refer to ODBC client

## 2.49 (2022-1-6)

- New Features
  - Add more logging to multithreaded result set fetch.

## 2.48 (2022-1-3)

- New Features
  - Insert statements supported

## 2.47 (2021-12-16)

- New Features
  - Data extract tool released.
  - Deactive connection caching for calls to createConnection

## 2.46 (2021-12-8)

- New Features
  - Fix connection pooling handling with regards to setting schema incorrectly.

## 2.45 (2021-12-2)

- New Features
  - Swallow runtime error as well when trying to set socket options.

## 2.44 (2021-12-1)

- New Features
  - Wrap invalid socket options in try catch block and swallow exceptions. For compatability with Java versions that are older.

## 2.43 (2021-11-22)

- New Features
  - Change driver to not rely on the pom/MANIFEST for the driver version. Move the version into JDBCDriver

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

## 2.42 (2021-11-18)

- New Features
  - Changed connections to utilize keep alive probes in order to detect dead connections.

## 2.41 (2021-11-07)

- New Features
  - Upgrade Jline version to 3.21

## 2.40 (2021-11-03)

- New Features
  - Improve result set fetching performance

## 2.39 (2021-10-29)

- New Features
  - Fix handling of expired token being used to start a session

## 2.38 (2021-10-27)

- New Features
  - Updated auth related SQLState error codes
  - Fix handling of result set close during result set caching

## 2.37 (2021-10-25)

- New Features
  - Force redirect support for testing purposes.
  - Removed duplicate code from CLI

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

## 2.36 (2021-10-14)

- New Features
  - Implemented refresh sessions support.
  - Implement get server session ID.

## 2.35 (2021-10-11)

- New Features
  - ExecutePlan and ExecuteInlinePlan bugfixes

## 2.34 (2021-9-9)

- New Features
  - Add token signature and issuer fingerprint fields to sso token handshake.
  - Add explicit SSO flags to handshake GCM.
  - Pass networkTimeout to new connection upon copy.

## 2.33 (2021-9-7)

- New Features
  - Add support for explicit SSO handshakes
  - Revert executeQuery redirection change

## 2.32 (2021-9-1)

- New Features
  - CLI source command stops on error
  - Support “output next query append”
  - Add statement command “get jdbc version”

## 2.31 (2021-8-30)

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

- New Features
  - Add sso handshake support
  - Refactor duplicated code in handshakes for saving secondary interfaces

## 2.30 (2021-8-26)

- New Features
  - Add validation on the driver side for set parameter settings.
  - Pass up invalid set parameter command errors.

## 2.29 (2021-8-20)

- New Features
  - Fix the way connection resets parameters when reset is true.
  - Fix an issue where redirect was not properly using mapped secondary interfaces

## 2.28 (2021-8-16)

- New Features
  - Fix sending parameters on reset. maxrow, maxtempdisk, maxtime, parallelism, priority now gets reset properly.
  - Map list all queries to select * from sys.queries
  - Improve logging
  - Statements with closed connections will not get returned to the cache

## 2.27 (2021-8-10)

- New Features
  - Fixed poorly structured if statement in CLI source command.
  - Remove more stack trace printing and add more logs.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

## 2.26 (2021-7-30)

- New Features
  - Move the duplicated regex code in CLI.java and XGStatement.java into a new file.
  - Implement a generic regex for syntax checking the set family of sql commands.
  - Fix a bug in resetting commands using lower cases. “set maxrow reset;” does not work. Needs to be capitalized.

## 2.25 (2021-7-27)

- New Features
  - Default clientVersion to 0.00 if the driver provides a null clientVersion to XGConnection.

## 2.24 (2021-7-12)

- New Features
  - Have setSchema handle unquoted caps sql. “SET SCHEMA MADISON” will set schema to “madison”.

## 2.23 (2021-7-6)

- New Features
  - Change SET CONCURRENCY command to SET PARALLELISM
  - Change “concurrency” driver property to “parallelism”

## 2.22 (2021-7-1)

- New Features
  - Add openJump extensions to jdbc jar.
  - Fix source command for plan execute inline.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

## 2.21 (2021-6-30)

- New Features
  - Fix new hashcode for null elements.

## 2.20 (2021-6-28)

- New Features
  - Update list all queries metadata to match that of select * from sys.queries
  - Add more connection level settings to hashCode.

## 2.19 (2021-6-26)

- New Features
  - Improve source command capabilities and performance

## 2.18 (2021-6-26)

- New Features
  - Save command history across sessions

## 2.17 (2021-6-25)

- New Features
  - Include the currently set schema to the connection hashcode.

## 2.16 (2021-6-23)

- New Features
  - Fix another issue with timeoutMillis. The timeout will now work correctly with zero ping buffers.

## 2.15 (2021-6-21)

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

- New Features
  - For dBeaver compatability, not setting a user in driver properties will cause the driver to default to empty string.

## 2.14 (2021-6-17)

- New Features
  - Fix timeoutMillis by correctly inheriting timeoutMillis from properties.
  - Clear warnings before running executeQuery and executeUpdate.

## 2.13 (2021-6-09)

- New Features
  - Added command to SET PSO SEED for the random number generator used in PSO
  - Remove chatty number of rows log.
  - Add remoteIp and service class to list all queries.
  - Add sleep_in_optimizer command for testing.

## 2.12 (2021-5-26)

- New Features
  - Fix the parsing for execute() to properly route to executeStatement()

## 2.11 (2021-5-20)

- New Features
  - Improve cache and statement pooling support for redirection.
  - Fix timestamp and time with negative nanos.

## 2.10 (2021-5-19)

- New Features

- Added 10 different colors for GIS types in KML
- Added non-GIS types to description of each GIS object in KML
- Moved KML feature from CLI to driver

## 2.09 (2021-5-18)

- New Features
  - Use daemon threads for background caching tasks. This allows the program to exit without finishing these tasks.

## 2.08 (2021-5-10)

- New Features
  - Add versions packaging to pom.xml.
  - Updated dependencies to latest version using versions plugin.
  - Change TLS to unverified by default.

## 2.07 (2021-5-05)

- New Features
  - Add OBJECT_NOT_FOUND_WARN warning.
  - Add OBJECT_ALREADY_EXISTS_WARN warning.
  - Fix some misleading log messages.

## 2.06 (2021-4-29)

- New Features
  - Add a log for if reconnect() fails to close a socket.
  - Driver sends over unique session ID to server.
  - Fix a misleading log in client handshake.

## 2.05 (2021-4-28)

- New Features
  - Fix spotbugs and narrow spotbugs filter.

## 2.04 (2021-4-22)

- New Features
  - Added getters to GIS types

## 2.03 (2021-4-22)

- New Features
  - Output next query also prints all gis types into a kml file

## 2.01 (2021-4-21)

- New Features
  - Fix empty point for STPoint class

## 2.01 (2021-4-20)

- New Features
  - Better build integration with xgsrc
  - Upgraded protobuf to version 3.14

## 2.00 (2021-4-17)

- New Features
  - Handling for cache limit warning.

## 1.99 (2021-4-13)

- New Features
  - Add support for EXPLAIN DEBUG, and make EXPLAIN format JSON by default

## 1.98 (2021-4-05)

- New Features
  - Add support for QUARANTINE
  - Fix CLI command force external on

## 1.97 (2021-4-02)

- New Features
  - Queries that exceed the row limit set by XGConnection::setMaxRows now silently omit excess rows. The previous behavior would result in query failure.

## 1.96 (2021-4-01)

- New Features
  - Add support for POINT EMPTY
  - Fix CLI performance on/off affecting timing setting.

## 1.95 (2021-3-22)

- New Features
  - Add support for CHECK DATA to CLI
  - Fix bug where defaultSchema was not working.

## 1.94 (2021-3-18)

- New Features
  - Add major and minor version to client handshake.
  - Add logging to set param functions.

## 1.93 (2021-3-11)

- New Features

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

- Improve performance of writing query results to a file.

## 1.92 (2021-3-5)

- New Features
  - Add driver method to cancel all cache return threads.
  - Add CLI functionality to limit max history size.

## 1.91 (2021-3-4)

- New Features
  - Add support for st_linestring and st_polygon

## 1.90 (2021-3-2)

- New Features
  - Enable spotbugs analysis
  - Increase tracing to millisecond granularity

## 1.89 (2021-2-24)

- New Features
  - Switch to using AES/GCM/NoPadding encryption

## 1.88 (2021-2-24)

- New Features
  - Fix some broken custom xgMetadata calls.

## 1.87 (2021-2-24)

- New Features
  - Added support for TUPLE columns as a SQL Struct type

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

## 1.86 (2021-2-19)

- New Features
  - Fix more OWASP bugs

## 1.85 (2021-2-18)

- New Features
  - Added CLI support for EXPORT VIEW

## 1.84 (2021-2-16)

- New Features
  - Update the request type for EXPLAIN PIPELINE

## 1.83 (2021-2-15)

- New Features
  - Fixed a bunch of OWASP bugs.

## 1.82 (2021-2-12)

- New Features
  - Add CLI support for SET MAXROWS, PRIORITY, CONCURRENCY, MAXTIME, and MAXTEMPDISK

## 1.81 (2021-2-12)

- New Features
  - Fix a compiler error with CLUSTER_NOT_FOUND error

## 1.80 (2021-2-12)

- New Features

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

- Add CLUSTER_NOT_FOUND error

## 1.79 (2021-2-11)

- New Features
  - Add spotbugs
  - Add support for EXPLAIN PIPELINE to CLI

## 1.78 (2021-2-5)

- New Features
  - Add SqlStates for LUP decomposition
  - Add additional cache logging.
  - Fix incorrect schema generated when first statements are created.

## 1.77 (2021-2-5)

- New Features
  - Remove unnecessary calls to fetchServerVersion
  - Fix schema for pooled connections and statement.

## 1.76 (2021-2-2)

- New Features
  - Pooling improvements

## 1.75 (2021-2-1)

- New Features
  - Allow changing session variable defaults via connection properties and make session variable overrides local to statement objects.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

## 1.74 (2021-1-31)

- New Features
  - Performance optimizations and restructuring

## 1.73 (2021-1-30)

- New Features
  - The JDBC driver now does connection and statement pooling that is automatic and transparent to the caller.

## 1.72 (2021-1-27)

- New Features
  - Add support for clearBatch()

## 1.71 (2021-1-14)

- New Features
  - Add support for session overrides of service class limits
  - SET MAXROWS {N}
  - SET MAXTIME {N}
  - SET PRIORITY {N}
  - SET CONCURRENCY {N}

## 1.70 (2021-1-12)

- New Features
  - Fix race condition between adding fetch threads to array and iterating. Also removed some duplicated code.

## 1.69 (2021-1-07)

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

- New Features
  - Remove deprecated plan proto

## 1.68 (2020-12-24)

- New Features
  - Fix describe view truncate in CLI.

## 1.67 (2020-12-14)

- New Features
  - Fixed cols2Types mapping in RS returned by LIST ALL COMPLETED QUERIES.

## 1.66 (2020-12-10)

- New Features
  - Add spaces to syntax parsing.

## 1.65 (2020-12-9)

- New Features
  - Completed queries update.

## 1.64 (2020-12-7)

- New Features
  - Properly handle the nullable property for the LIST ALL COMPLETED QUERIES command.

## 1.63 (2020-12-1)

- New Features
  - Don’t print stack trace when select queries complete exceptionally.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

## 1.62 (2020-11-30)

- New Features
  - Added support for LIST ALL COMPLETED QUERIES command.

## 1.61 (2020-11-15)

- New Features
  - Fix reconnect and resending logic.

## 1.60 (2020-11-10)

- New Features
  - DESCRIBE TABLE now consistently uses SMALLINT and BIGINT to describe inner types of arrays

## 1.59 (2020-11-4)

- New Features
  - remove another unnecessary driver version fetch.
  - add jar version to log

## 1.58 (2020-11-4)

- New Features
  - fix fetch version redirect loop.

## 1.57 (2020-11-4)

- New Features
  - make SQLException codes unique.

## 1.56 (2020-11-2)

- New Features
  - kill and cancel now throws syntax errors.

## 1.55 (2020-10-28)

- New Features
  - CLI now recognizes a DDL statement for INVALIDATE STATS.

## 1.54 (2020-10-21)

- New Features
  - fix another spot where all the slq nodes can be brought down.

## 1.53 (2020-10-20)

- New Features
  - exportTranslation will close the result set.

## 1.52 (2020-10-19)

- New Features
  - executeQuery will not rerun query after reconnect.

## 1.51 (2020-10-11)

- New Features
  - Add token fields and username to localQueries protobuf

## 1.50 (2020-10-11)

- New Features
  - Multiple result set threads support is complete

## 1.49 (2020-10-06)

- New Features
  - Experimental support for multiple result set threads

## 1.48 (2020-09-28)

- New Features
  - Minor fix of SQLStates
  - setParms() does no work when there are no parameters

## 1.47 (2020-09-26)

- New Features
  - Improve performance for large SQL statements

## 1.46 (2020-09-21)

- New Features
  - Bug fix for driver not reconnecting when a previous result set is still open.

## 1.45 (2020-09-16)

- New Features
  - Move export translation into result set.

## 1.44 (2020-09-15)

- New Features
  - Support granting and revoking both privileges and role membership.

## 1.43 (2020-09-14)

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

- New Features
    - Explain, listTables, listViews, getSchema, describeTable, describeView, explainPlan, listAllQueries, and exportTable.

## 1.42 (2020-09-2)

- New Features
    - Move some custom functionalities into the driver including: get/set schema, list (system) tables, list views, describe table/views, list indexes, execute/explain plan, cancel/kill query, list all queries, export table, set max rows, set pso.

## 1.41 (2020-08-20)

- New Features
    - Ability to set max output rows from the CLI

## 1.40 (2020-08-14)

- New Features
    - SSL support.

## 1.37 (2020-07-26)

- New Features
    - Timestamp and Time now have nanosecond precision

## 1.36 (2020-07-25)

- New Features
    - JDBC driver can now handle hostnames sent back in interface list

## 1.35 (2020-07-23)

- New Features

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

- Capture initial connection IP and use as last resort for reconnect()

## 1.34 (2020-07-14)

- New Features
  - Implement new time/date/timestamp subclasses to circumvent bugs in the standard versions

## 1.33 (2020-07-04)

- New Features
  - Add support for load balancing with secondary SQL interfaces

## 1.32 (2020-06-26)

- New Features
  - Add support for Export Translation to CLI

## 1.31 (2020-06-23)

- New Features
  - Fix misbehavior with ‘plan execute inline’ using the CLI

## 1.30 (2020-06-22)

- New Features
  - Deprecated the Apache® Hadoop® Distributed File System (HDFS) connection table, which was consolidated into the external connection table

## 1.29 (2020-06-18)

- New Features
  - Creating an MLModel on no data is now an error, not a warning

## 1.28 (2020-06-11)

- New Features
  - Allow one connection to be shared by multiple threads, as long as each thread uses its own Statement object

## 1.27 (2020-06-11)

- New Features
  - Improve trace log formatting, including adding thread id

## 1.26 (2020-06-09)

- New Features
  - Add support for weeks interval type

## 1.25 (2020-06-05)

- New Features
  - Support for getTableTypes()

## 1.24 (2020-06-05)

- New Features
  - Protobuf message changes for Add Column feature

## 1.23 (2020-06-02)

- New Features
  - Add new error code: Value too large, which indicates that a column value is larger than internal limits

## 1.22 (2020-05-31)

© 2026 Ocient, Inc

- New Features
  - Add calendar support
- Bug Fixes
  - Properly handle case-insensitivity of column names on result sets

## 1.21 (2020-05-26)

- New Features
  - Add tracing support

## 1.20 (2020-05-19)

- Bug Fixes
  - DB-11119 - JDBC multi-host support was not implemented correctly

## 1.19 (2020-05-13)

## 1.18 (2020-05-11)

## 1.16 (2020-04-15)

- Bug Fixes
  - DB-10687 - Fix for Kill/Cancel query

## 1.15 (2020-04-14)

- Bug Fixes
  - DB-9928 - Fixes for SQL Array type

## 1.14 (2020-04-11)

- New Features

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

- Protocol support for the NULLS FIRST in the ORDER BY clause

## 1.13 (2020-03-20)

- New Features
  - Binary support for the serialization of the following data types: ST_POINT, UUID, IP and IPV4
  - Implementation of the Array SQL type

## 1.12 (2020-03-01)

- Bug Fixes
  - DB-10155 - Broadcast kill query and cancel query requests to all sql nodes.
- New Features
  - DB-10137 - Implement JDBC cancel query. Now it is possible to kill query in dbeaver.
  - DB-10120 - JDBC driver support list of sql nodes to connect to
  - DB-10119 - Support for multiple IPs under the same DNS address

# pyocient Release Notes

Release notes for pyocient, the Ocient Python module, including new features, API changes, bug fixes, and dependency updates across module versions.

## 3.9.0

- Added support for the `CHECK CONSTRAINTS` statement, which reports whether each primary key, unique, and foreign key constraint on a table is valid. Requires version 28.0 or later of the Ocient® System.
- Changed the `Connection.close()` method to no longer roll back an uncommitted transaction by default, which matches the Ocient JDBC driver. To roll back on close, call `close(skip_auto_rollback=False)`.

## 3.8.0

- Added the `memory_tracing` flag for memory-based debugging.

## 3.7.0

- Added transactional support.
- Added asynchronous update support.
- Added the display of the full complex type information.
- Enabled the printing of the query Universally Unique IDentifier (UUID) when the system fails or experiences a Keyboard Interrupt.
- Added generic server-side `cancel` and `kill` commands. This addition is not compatible with an Ocient System that has a version less than 25.0.

## 3.6.0

- Added support for Dataflow SQL statements. Dataflow is a procedural superset of SQL that acts as an ad-hoc, anonymous, and imperative script. This new syntax parses, compiles, and executes logic in a single request using flow control,

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

variables, scoped temporary tables, and exception handling. This new functionality requires version 27 or later of the Ocient System.

- Added support for cross-database SSO authentication.
- Added support for Google® as an OIDC provider with server-side token exchange and polling.
- Added support for specifying identity providers and SSO OAuth flow options.
- Added support for SSL and hostname in SSO callback URLs.
- Added support for token lifetimes in the client wire protocol.
- Added the commit SHA to the pyocient package for version tracking.
- Added support for URL-encoded special characters in DSN passwords.
- Fixed the driver to return NULL elements in multidimensional arrays as `None` instead of empty arrays.
- Fixed precision and scale handling during the cast of arrays and tuples that contain DECIMAL types.
- Removed an unnecessary debug print statement.
- Fixed the parsing of CLI argument keys to be lowercase.
- Improved CLI parsing of Ocient SQL statements.
- Reduced the verbosity of debug messages during normal operation.
- Added graph functionality using the `ocient_graph` Python® package.

## 3.5.0

- Added support for executable SQL files using shebang lines in the command-line interface (CLI).
- Added `expect error` and `expect rowcount` commands to the CLI.
- Added enhanced help functionality to the CLI.
- Added nanosecond precision support for timestamp data types.
- Added server-side `DESCRIBE TABLE` and `DESCRIBE VIEW` command support with fallback to the client-side `DESCRIBE` command for older server versions.
- Added connection timeout support to prevent hanging connections.
- Added configurable redirect URIs per OIDC integration for SSO functionality.

- Fixed an infinite loop issue when the fetch size is set to 0.
- Improved parameter expansion handling and error messaging.
- Improved Unicode character formatting in JSON output and CLI display.
- Updated protobuf dependency to version 5.29.2 or higher.
- Reduced verbosity for connection-type logging messages.
- Added support for preserving schema and service class settings after reconnection.
- Improved error handling for invalid DSNs in the CLI.

## 3.4.0

- Added support for the `PREVIEW` DDL SQL statement.
- Support cryptography versions greater than 42.0.0.
- Fixed an issue that returned `-1` rows modified.
- Fixed the handling of an invalid DSN on the pyocient CLI.
- Formatted Unicode characters in JSON output.
- Fixed an issue where not all warnings were reported.
- Added the messages attribute to the cursor.
- Improved parameter expansion.
- Supported loglevel and logfile parameters on DSNs.
- Preserved the Connection object for reconnects.

## 3.3.2

- Fixed ending SSO sessions when you close the connection.

## 3.3.0

- Pinned the cryptography package to a version earlier than 42.0.0 for stability purposes.
- Added OIDC single sign on (SSO).
- Added the `performance mode` command.

- Enabled the display of nulls as NULL when using the table format.
- Set the command-line default fetch size to 30000.
- Fixed the implementation of the `set serviceclass` command.
- Changed `pyocient.Warning` to be a subclass of the Python `Warning` class.
- Added the `set printuuid on` command.
- Added the `--version` option at the command line.
- Set the TCP `keepalive` options on connections.
- Added a valid error message when the system rejects a connection without SSL encryption.

## 3.0.3

- The `TypeCodes` class has been changed to a Python `IntEnum`.
- GIS types _STPoint, _STLinestring, and _STPolygon have been renamed to STPoint, STLinestring, and STPolygon, respectively.
- The `user` and `password` fields have been removed from the `Connection` object. This object no longer stores these fields.
- You can pass the `security_token` from another connection to the `connect` function.
- The `Session` object has been removed.
- The `custom_type_to_json` function has been moved into the pyocient API to allow the consistent conversion of the result set to the JSON format.
- The `patch` portion of the pyocient version is sent to and logged in the database.
- The `--nooutput` command-line parameter does not throw a Python exception.
- The `local variable 'return_code' referenced before assignment` error has been fixed.
- Added the `--rows` argument to the command-line program to load the result set in batches.

## 2.0.0

- Packaging has been significantly refactored to match Python packaging standards.

- Python context manager support has been added to connections and cursors.
- Python type annotations have been added to the pyocient API.
- Fixed the command-line interface (CLI) to return a non-zero code for statements that fail.
- CLI output has been standardized to either go to the output file or standard output (stdout).
- The option to echo statements has been added as a command-line option.
- The `pyocient.SyntaxError` exception, which conflicted with the built-in Python `SyntaxException`, has been removed.
- `pyocient.version` has been removed in favor of the more standard `pyocient.__version__`.

## 1.0.15

- The dependency on `protobuf` has been upgraded from `>=3.12.0`, `<=3.19.1` to `>=3.20.0`, `<=4.22.0`.
- Fixed an error that occurs when you do not specify the host parameter in the `connect()` API.

## 1.0.14

- Updated pyocient dependencies to eliminate some unused dependencies and tighten the dependencies on `protobuf` and `dsnparse`.

## 1.0.13

- Fixed bug that left `Cursor.rowcount` unset after Data Manipulation Language (DML) query execution.
- The `cryptography` package requirement of version 36 or lower is no longer required.

## 1.0.12

- Added `--nohistory` command-line option. The history file does not store commands from the session. Added `ignorespace` option to command-line history. The history file omits lines that begin with a white space character.

## 1.0.11

- Added a link to the release notes to the package description.

## 1.0.10

- Fixed error in the parameter substitution docstring.
- Added support for `SERVICECLASS`, `ADJUSTFACTOR`, `ADJUSTTIME`, and `PSO` query settings.
- Added support for the `SHOW` command.
- Added support for the `CANCEL TASK` command.
- Removed support for `PRIORITY_ADJUSTMENT_FACTOR`, `PRIORITY_ADJUSTMENT_TIME`, `MIN_PRIORITY`, and `MAX_PRIORITY` query settings.
- Deprecate support for the `CHECK DATA` command.
- Fixed output of binary types at the command line.

## 1.0.9

- Added CSV output support
- Updated cryptography package dependency from <3.4 to <=36.0
- Updated cffi and google-auth dependencies
- Improved decoding performance by caching the decoders
- Added formal STPoint, STLinestring, and STPolygon classes rather than using tuples and lists
- Added support for PRIORITY_ADJUSTMENT_FACTOR, PRIORITY_ADJUSTMENT_TIME, MIN_PRIORITY, and MAX_PRIORITY query settings.
- Enabled the handling of invalid DNS names received from the database

© 2026 Ocient, Inc Ocient Proprietary and Confidential

## 1.0.7

- Fixed crash on invalid UTF-8 characters received from the database
- Fixed a bug related to specifying the user through the connect API
- Standardized Python(R) code formatting

## 1.0.6

- Updated handling of the force option on connections for accuracy

## 1.0.5

- Added additional debug logging to the redirection of connection

## 1.0.4

- Updated the redirect logic for accuracy

## 1.0.3

- Added multiple host support to the DSN
- Removed —tables, —systables, and —views command-line options
- Added support for the source, connect to, and set commands
- Added support for starting without a DSN

# OCGraph Release Notes

Release notes for the OCGraph graph analytics libraries for Python and Java, including new algorithms, API changes, and execution mode configuration across library versions.

The OCGraph libraries provide graph analytics for the Ocient® System through both Python® (`ocient_graph` using pyocient) and Java® (using the JDBC driver). Changes listed here apply to both libraries unless noted otherwise. Python function names use snake case `snake_case` and Java method names use camel case `camelCase`. For library-specific reference documentation, see **OCGraph Python Library** and **OCGraph Java Library**.

## 1.1.0

- Added these 15 new graph algorithms:
  - `a_star_shortest_path`
  - `cosine_similarity`
  - `cycle_detection`
  - `eigenvector_centrality`
  - `fast_random_projection`
  - `jaccard_similarity`
  - `k_core_decomposition`
  - `leiden_modularity_optimization`
  - `louvain_modularity_optimization`
  - `max_bipartite_matching`
  - `random_walk`
  - `stable_marriage`
  - `temporal_page_rank`
  - `time_respecting_shortest_path`
  - `yens_k_shortest_paths`

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

    - For details, see **OCGraph Python Library** and **OCGraph Java Library**.
- (Python only) Added the `ExecutionMode` enum and the `set_execution_config()` function. These items control whether graph algorithms run using the legacy JDBC or SQL batch implementation or, if the connected Ocient System supports it, an Ocient data flow implementation. The default, `AUTO_FASTEST`, automatically selects the faster option. For details, see **OCGraph Python Library**.
- (Python only) Added execution backed by data flows to `aggregate_messages`.
- Removed the `max_iterations` argument from the `connected_components` (Python) and `connectedComponents` (Java) functions. Existing code that passes this argument must remove it.
- (Python only) Removed the `TriangleCount` class and its `run()` method. Use the new `triangle_count()` function instead, which accepts the same arguments in the same order.
- Renamed the PageRank damping factor argument from `reset_prob` to `damping_factor` (Python) and from `resetProb` to `dampingFactor` (Java) in static, dynamic, and temporal PageRank functions. Ocient temporarily accepts the deprecated Python keyword argument `reset_prob` as an alias for `damping_factor`. For details, see **OCGraph Python Library** and **OCGraph Java Library**.
- Increased the maximum MATRIX size from 16,384 elements to 67,108,864 elements. The maximum memory allocation remains 512MiB. For details, see **Data Types for SQL Functions**.

# 1.0.0

- Initial release of the OCGraph libraries. The Python `ocient_graph` module and the Java `OCGraph` JDBC class provide graph analytics operations (similar to Apache® Spark™ GraphX) for the Ocient System. For details, see **OCGraph Python Library** and **OCGraph Java Library**.

# Spark Connector Release Notes

Release notes for the Ocient Spark Connector, including new features, bug fixes, and compatibility changes for each connector version.

The Ocient® Spark Connector integrates Apache® Spark™ with the Ocient System. For details, see **JDBC Spark Connector**.

## 1.2.0 (2026-07-24)

- Added support for vectors and matrices as nested types in the Spark connector. This feature requires Ocient System version 28 or later and JDBC driver version 4.3.0 or later.

## 1.1.2 (2026-07-14)

Internal updates only.

## 1.1.1 (2026-06-25)

- Enabled write tasks to retry refused connections.
- Changed the Spark connector to infer the schema from result-set metadata instead of catalog tables.

## 1.1.0 (2026-06-02)

- Added support for transactional writes.
- Added support for S3 bulk load.
- Added a configurable logger.
- Vectors and matrices converted to native Ocient types instead of arrays of doubles.
- Added type hints for subfields in the Spark connector.

## 1.0.1 (2026-02-09)

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

Initial release of the Ocient Spark Connector.

# Glossary

Glossary of acronyms and terms used in the Ocient System, covering architecture, SQL, data pipelines, geospatial, and ML concepts.

Use this table to reference frequently used acronyms and terms with the Ocient® System or the OcientAIQ™ Unified Data Platform.

| Name | Definition |
|---|---|
| AA | Auto Acquire |
| AdTech | Advertising technology |
| ANTLR | ANother Tool for Language Recognition |
| API | Application Programming Interface |
| ASIO | Async I/O library |
| AST | Abstract Syntax Tree |
| CFL | Continuous File Loading |
| CmdComp | Command Compiler |
| CTAS | CREATE TABLE AS SELECT SQL statement |
| CTE | Common Table Expression |
| DCL | Data Control Language |
| DDL | Data Definition Language |
| DML | Data Manipulation Language |
| DR | Disaster Recovery |
| ELT | Extract, Load, and Transform |
| ETL | Extract, Transform, and Load |
| FinTech | Financial technology |
| GDC | Global Dictionary Compression |
| GDS | Global Data Storage |
| GIS | Geospatial Information System |

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

| Name | Definition |
| --- | --- |
| HA | High Availability |
| IAS | INSERT INTO SELECT SQL statement |
| IDA | Information Dispersal Algorithm |
| LCK | Local Cluster Key |
| LTS | Foundation Node |
| NUMA | Non-Uniform Memory Architecture |
| NVMe | Non-Volatile Memory Express |
| OLAP | Online Analytical Processing |
| OSC | Ocient Stream Client |
| OSN | Ownership Sequence Number |
| TKT | TimeKey® Time |
| TTQ | Time to Queryability |
| UDT | User-defined Transform |
| UIO | User mode I/O |
| UUID | Universally Unique Identifier |
| VM | Virtual Machine |
| WLM | Workload Management |

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object

form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work

or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

   (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

   (b) You must cause any modified files to carry prominent notices stating that You changed the files; and

   (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

   (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

   You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use,

reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only

```
   on Your own behalf and on Your sole responsibility, not on behalf
   of any other Contributor, and only if You agree to indemnify,
   defend, and hold each Contributor harmless for any liability
   incurred by, or claims asserted against, such Contributor by reason
   of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

   To apply the Apache License to your work, attach the following
   boilerplate notice, with the fields enclosed by brackets "[]"
   replaced with your own identifying information. (Don't include
   the brackets!)  The text should be enclosed in the appropriate
   comment syntax for the file format. We also recommend that a
   file or class name and description of purpose be included on the
   same "printed page" as the copyright notice for easier
   identification within third-party archives.

© 2026 Ocient, Inc

form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work

or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

   (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

   (b) You must cause any modified files to carry prominent notices stating that You changed the files; and

   (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

   (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

   You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use,

reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only

   on Your own behalf and on Your sole responsibility, not on behalf
   of any other Contributor, and only if You agree to indemnify,
   defend, and hold each Contributor harmless for any liability
   incurred by, or claims asserted against, such Contributor by reason
   of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

   To apply the Apache License to your work, attach the following
   boilerplate notice, with the fields enclosed by brackets "[]"
   replaced with your own identifying information. (Don't include
   the brackets!)  The text should be enclosed in the appropriate
   comment syntax for the file format. We also recommend that a
   file or class name and description of purpose be included on the
   same "printed page" as the copyright notice for easier
   identification within third-party archives.

---

3rdparty dependency LLVM is statically linked in certain binary distributions. Additionally some sections of source code have been derived from sources in LLVM and have been clearly labeled as such. LLVM has the following license:

==============================================================================
The LLVM Project is under the Apache License v2.0 with LLVM Exceptions:
==============================================================================

Apache License
Version 2.0, January 2004
http://www.apache.org/licenses/

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes

of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate

as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

(a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

(b) You must cause any modified files to carry prominent notices stating that You changed the files; and

(c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

(d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability

incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets "[]" replaced with your own identifying information. (Don't include the brackets!) The text should be enclosed in the appropriate comment syntax for the file format. We also recommend that a file or class name and description of purpose be included on the same "printed page" as the copyright notice for easier identification within third-party archives.

Copyright [yyyy] [name of copyright owner]

Licensed under the Apache License, Version 2.0 (the "License");
you may not use this file except in compliance with the License.
You may obtain a copy of the License at

http://www.apache.org/licenses/LICENSE-2.0

Unless required by applicable law or agreed to in writing, software
distributed under the License is distributed on an "AS IS" BASIS,
WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied.
See the License for the specific language governing permissions and
limitations under the License.

---- LLVM Exceptions to the Apache 2.0 License ----

As an exception, if, as a result of your compiling your source code, portions of this Software are embedded into an Object form of such source code, you may redistribute such embedded portions in such Object form without complying with the conditions of Sections 4(a), 4(b) and 4(d) of the License.

In addition, if you combine or link compiled forms of this Software with software that is licensed under the GPLv2 ("Combined Software") and if a court of competent jurisdiction determines that the patent provision (Section 3), the indemnity provision (Section 9) or other Section of the License conflicts with the conditions of the GPLv2, you may retroactively and

prospectively choose to deem waived or otherwise exclude such Section(s) of the License, but only in their entirety and only with respect to the Combined Software.

==============================================================================
Software from third parties included in the LLVM Project:
==============================================================================
The LLVM Project contains third party software which is under different license terms. All such code will be identified clearly using at least one of two mechanisms:
1) It will be in a separate directory tree with its own `LICENSE.txt` or `LICENSE` file at the top containing the specific license and restrictions which apply to that software, or
2) It will contain specific license and restriction terms at the top of every file.

## AWS SDK for C++ (including the AWS Common Runtime)

Text

Apache License
Version 2.0, January 2004
http://www.apache.org/licenses/

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the

editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct

or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

   (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

   (b) You must cause any modified files to carry prominent notices stating that You changed the files; and

   (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

   (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

   You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with

the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf

of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets "{}" replaced with your own identifying information. (Don't include the brackets!) The text should be enclosed in the appropriate comment syntax for the file format. We also recommend that a file or class name and description of purpose be included on the same "printed page" as the copyright notice for easier identification within third-party archives.

Copyright {yyyy} {name of copyright owner}

Licensed under the Apache License, Version 2.0 (the "License");
you may not use this file except in compliance with the License.
You may obtain a copy of the License at

http://www.apache.org/licenses/LICENSE-2.0

Unless required by applicable law or agreed to in writing, software
distributed under the License is distributed on an "AS IS" BASIS,
WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied.
See the License for the specific language governing permissions and
limitations under the License.

Apache License
Version 2.0, January 2004
https://www.apache.org/licenses/

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object

© 2026 Ocient, Inc

form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work

or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

   (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

   (b) You must cause any modified files to carry prominent notices stating that You changed the files; and

   (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

   (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

   You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use,

reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only

```
   on Your own behalf and on Your sole responsibility, not on behalf
   of any other Contributor, and only if You agree to indemnify,
   defend, and hold each Contributor harmless for any liability
   incurred by, or claims asserted against, such Contributor by reason
   of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

   To apply the Apache License to your work, attach the following
   boilerplate notice, with the fields enclosed by brackets "[]"
   replaced with your own identifying information. (Don't include
   the brackets!)  The text should be enclosed in the appropriate
   comment syntax for the file format. We also recommend that a
   file or class name and description of purpose be included on the
   same "printed page" as the copyright notice for easier
   identification within third-party archives.

Copyright [yyyy] [name of copyright owner]

Licensed under the Apache License, Version 2.0 (the "License");
you may not use this file except in compliance with the License.
You may obtain a copy of the License at

    https://www.apache.org/licenses/LICENSE-2.0

Unless required by applicable law or agreed to in writing, software
distributed under the License is distributed on an "AS IS" BASIS,
WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied.
See the License for the specific language governing permissions and
limitations under the License.

#
#  Copyright 2000, 2001, 2002, 2003 Nara Institute of Science
#  and Technology.  All Rights Reserved.
#
#  Use, reproduction, and distribution of this software is permitted.
#  Any copy of this software, whether in its original form or modified,
#  must include both the above copyright notice and the following
#  paragraphs.
#
#  Nara Institute of Science and Technology (NAIST),
#  the copyright holders, disclaims all warranties with regard to this
#  software, including all implied warranties of merchantability and
#  fitness, in no event shall NAIST be liable for
#  any special, indirect or consequential damages or any damages
#  whatsoever resulting from loss of use, data or profits, whether in an
#  action of contract, negligence or other tortuous action, arising out
#  of or in connection with the use or performance of this software.
#
#  A large portion of the dictionary entries
#  originate from ICOT Free Software.  The following conditions for ICOT
#  Free Software applies to the current dictionary as well.
#
#  Each User may also freely distribute the Program, whether in its
#  original form or modified, to any third party or parties, PROVIDED
#  that the provisions of Section 3 ("NO WARRANTY") will ALWAYS appear
#  on, or be attached to, the Program, which is distributed substantially
#  in the same form as set out herein and that such intended
#  distribution, if actually made, will neither violate or otherwise
#  contravene any of the laws and regulations of the countries having
#  jurisdiction over the User or the intended distribution itself.
#
#  NO WARRANTY
```

```
#
#  The program was produced on an experimental basis in the course of the
#  research and development conducted during the project and is provided
#  to users as so produced on an experimental basis.  Accordingly, the
#  program is provided without any warranty whatsoever, whether express,
#  implied, statutory or otherwise.  The term "warranty" used herein
#  includes, but is not limited to, any warranty of the quality,
#  performance, merchantability and fitness for a particular purpose of
#  the program and the nonexistence of any infringement or violation of
#  any right of any third party.
#
#  Each user of the program will agree and understand, and be deemed to
#  have agreed and understood, that there is no warranty whatsoever for
#  the program and, accordingly, the entire risk arising from or
#  otherwise connected with the program is assumed by the user.
#
#  Therefore, neither ICOT, the copyright holder, or any other
#  organization that participated in or was otherwise related to the
#  development of the program and their respective officials, directors,
#  officers and other employees shall be held liable for any and all
#  damages, including, without limitation, general, special, incidental
#  and consequential damages, arising out of or otherwise in connection
#  with the use or inability to use the program or any product, material
#  or result produced or otherwise obtained by using the program,
#  regardless of whether they have been advised of, or otherwise had
#  knowledge of, the possibility of such damages at any time during the
#  project or thereafter.  Each user will be deemed to have agreed to the
#  foregoing by his or her commencement of use of the program.  The term
#  "use" as used herein includes, but is not limited to, the use,
#  modification, copying and distribution of the program and the
#  production of secondary products from the program.
#
#  In the case where the program, whether in its original form or
#  modified, was distributed or delivered to or received by a user from
#  any person, organization or entity other than ICOT, unless it makes or
#  grants independently of ICOT any specific warranty to the user in
#  writing, such person, organization or entity, will also be exempted
#  from and not be held liable to the user for any such damages as noted
#  above as far as the program is concerned.

Time Zone Database

ICU uses the public domain data and code derived from Time Zone Database for its time zone support. The ownership of the TZ database is explained in BCP 175: Procedure for Maintaining the Time Zone Database section 7.

```
 # 7.  Database Ownership
 #
 #    The TZ database itself is not an IETF Contribution or an IETF
 #    document.  Rather it is a pre-existing and regularly updated work
 #    that is in the public domain, and is intended to remain in the
 #    public domain.  Therefore, BCPs 78 [RFC5378] and 79 [RFC3979] do
 #    not apply to the TZ Database or contributions that individuals make
 #    to it.  Should any claims be made and substantiated against the TZ
 #    Database, the organization that is providing the IANA
 #    Considerations defined in this RFC, under the memorandum of
 #    understanding with the IETF, currently ICANN, may act in accordance
 #    with all competent court orders.  No ownership claims will be made
 #    by ICANN or the IETF Trust on the database or the code.  Any person
 #    making a contribution to the database or code waives all rights to
 #    future claims in that contribution or in the TZ Database.
```

Creative Commons Legal Code

CC0 1.0 Universal

    CREATIVE COMMONS CORPORATION IS NOT A LAW FIRM AND DOES NOT PROVIDE LEGAL SERVICES. DISTRIBUTION OF THIS DOCUMENT DOES NOT CREATE AN ATTORNEY-CLIENT RELATIONSHIP. CREATIVE COMMONS PROVIDES THIS INFORMATION ON AN "AS-IS" BASIS. CREATIVE COMMONS MAKES NO WARRANTIES REGARDING THE USE OF THIS DOCUMENT OR THE INFORMATION OR WORKS PROVIDED HEREUNDER, AND DISCLAIMS LIABILITY FOR DAMAGES RESULTING FROM THE USE OF THIS DOCUMENT OR THE INFORMATION OR WORKS PROVIDED HEREUNDER.

Statement of Purpose

The laws of most jurisdictions throughout the world automatically confer exclusive Copyright and Related Rights (defined below) upon the creator and subsequent owner(s) (each and all, an "owner") of an original work of authorship and/or a database (each, a "Work").

Certain owners wish to permanently relinquish those rights to a Work for the purpose of contributing to a commons of creative, cultural and scientific works ("Commons") that the public can reliably and without fear of later claims of infringement build upon, modify, incorporate in other works, reuse and redistribute as freely as possible in any form whatsoever and for any purposes, including without limitation commercial purposes. These owners may contribute to the Commons to promote the ideal of a free culture and the further production of creative, cultural and scientific works, or to gain reputation or greater distribution for their Work in part through the use and efforts of others.

For these and/or other purposes and motivations, and without any expectation of additional consideration or compensation, the person associating CC0 with a Work (the "Affirmer"), to the extent that he or she is an owner of Copyright and Related Rights in the Work, voluntarily elects to apply CC0 to the Work and publicly distribute the Work under its terms, with knowledge of his or her Copyright and Related Rights in the Work and the meaning and intended legal effect of CC0 on those rights.

1. Copyright and Related Rights. A Work made available under CC0 may be protected by copyright and related or neighboring rights ("Copyright and

© 2026 Ocient, Inc

Related Rights"). Copyright and Related Rights include, but are not limited to, the following:

i. the right to reproduce, adapt, distribute, perform, display, communicate, and translate a Work;
ii. moral rights retained by the original author(s) and/or performer(s);
iii. publicity and privacy rights pertaining to a person's image or likeness depicted in a Work;
iv. rights protecting against unfair competition in regards to a Work, subject to the limitations in paragraph 4(a), below;
v. rights protecting the extraction, dissemination, use and reuse of data in a Work;
vi. database rights (such as those arising under Directive 96/9/EC of the European Parliament and of the Council of 11 March 1996 on the legal protection of databases, and under any national implementation thereof, including any amended or successor version of such directive); and
vii. other similar, equivalent or corresponding rights throughout the world based on applicable law or treaty, and any national implementations thereof.

2. Waiver. To the greatest extent permitted by, but not in contravention of, applicable law, Affirmer hereby overtly, fully, permanently, irrevocably and unconditionally waives, abandons, and surrenders all of Affirmer's Copyright and Related Rights and associated claims and causes of action, whether now known or unknown (including existing as well as future claims and causes of action), in the Work (i) in all territories worldwide, (ii) for the maximum duration provided by applicable law or treaty (including future time extensions), (iii) in any current or future medium and for any number of copies, and (iv) for any purpose whatsoever, including without limitation commercial, advertising or promotional purposes (the "Waiver"). Affirmer makes the Waiver for the benefit of each member of the public at large and to the detriment of Affirmer's heirs and successors, fully intending that such Waiver shall not be subject to revocation, rescission, cancellation, termination, or any other legal or equitable action to disrupt the quiet enjoyment of the Work by the public as contemplated by Affirmer's express Statement of Purpose.

3. Public License Fallback. Should any part of the Waiver for any reason be judged legally invalid or ineffective under applicable law, then the Waiver shall be preserved to the maximum extent permitted taking into account Affirmer's express Statement of Purpose. In addition, to the extent the Waiver is so judged Affirmer hereby grants to each affected

person a royalty-free, non transferable, non sublicensable, non exclusive, irrevocable and unconditional license to exercise Affirmer's Copyright and Related Rights in the Work (i) in all territories worldwide, (ii) for the maximum duration provided by applicable law or treaty (including future time extensions), (iii) in any current or future medium and for any number of copies, and (iv) for any purpose whatsoever, including without limitation commercial, advertising or promotional purposes (the "License"). The License shall be deemed effective as of the date CCO was applied by Affirmer to the Work. Should any part of the License for any reason be judged legally invalid or ineffective under applicable law, such partial invalidity or ineffectiveness shall not invalidate the remainder of the License, and in such case Affirmer hereby affirms that he or she will not (i) exercise any of his or her remaining Copyright and Related Rights in the Work or (ii) assert any associated claims and causes of action with respect to the Work, in either case contrary to Affirmer's express Statement of Purpose.

4. Limitations and Disclaimers.

a. No trademark or patent rights held by Affirmer are waived, abandoned, surrendered, licensed or otherwise affected by this document.
b. Affirmer offers the Work as-is and makes no representations or warranties of any kind concerning the Work, express, implied, statutory or otherwise, including without limitation warranties of title, merchantability, fitness for a particular purpose, non infringement, or the absence of latent or other defects, accuracy, or the present or absence of errors, whether or not discoverable, all to the greatest extent permissible under applicable law.
c. Affirmer disclaims responsibility for clearing rights of other persons that may apply to the Work or any use thereof, including without limitation any person's Copyright and Related Rights in the Work. Further, Affirmer disclaims responsibility for obtaining any necessary consents, permissions or other rights required for any use of the Work.
d. Affirmer understands and acknowledges that Creative Commons is not a party to this document and has no duty or obligation with respect to this CCO or use of the Work.

## jsoncpp

Text

```
The JsonCpp library's source code, including accompanying documentation,
tests and demonstration applications, are licensed under the following
conditions...

Baptiste Lepilleur and The JsonCpp Authors explicitly disclaim copyright in all
jurisdictions which recognize such a disclaimer. In such jurisdictions,
this software is released into the Public Domain.

In jurisdictions which do not recognize Public Domain property (e.g. Germany as c
2010), this software is Copyright (c) 2007-2010 by Baptiste Lepilleur and
The JsonCpp Authors, and is released under the terms of the MIT License (see belo

In jurisdictions which recognize Public Domain property, the user of this
software may choose to accept it either as 1) Public Domain, 2) under the
conditions of the MIT License (see below), or 3) under the terms of dual
Public Domain/MIT License conditions described here, as they choose.

The MIT License is about as close to Public Domain as a license can get, and is
described in clear, concise terms at:

   http://en.wikipedia.org/wiki/MIT_License

The full text of the MIT License follows:

========================================================================
Copyright (c) 2007-2010 Baptiste Lepilleur and The JsonCpp Authors

Permission is hereby granted, free of charge, to any person
obtaining a copy of this software and associated documentation
files (the "Software"), to deal in the Software without
restriction, including without limitation the rights to use, copy,
modify, merge, publish, distribute, sublicense, and/or sell copies
of the Software, and to permit persons to whom the Software is
furnished to do so, subject to the following conditions:

The above copyright notice and this permission notice shall be
included in all copies or substantial portions of the Software.

THE SOFTWARE IS PROVIDED "AS IS", WITHOUT WARRANTY OF ANY KIND,
EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF
MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND
```

```
NONINFRINGEMENT. IN NO EVENT SHALL THE AUTHORS OR COPYRIGHT HOLDERS
BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER LIABILITY, WHETHER IN AN
ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING FROM, OUT OF OR IN
CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER DEALINGS IN THE
SOFTWARE.
==========================================================================
(END LICENSE TEXT)

The MIT license is compatible with both the GPL and commercial
software, affording one all of the rights of Public Domain with the
minor nuisance of being required to keep the above copyright notice
and license text in the source code. Note also that by accepting the
Public Domain "license" you can re-license your copy using whatever
license you like.
```

Downloading of this software may constitute an export of cryptographic software from the United States of America that is subject to the United States Export Administration Regulations (EAR), 15 CFR 730-774. Additional laws or regulations may apply.  It is the responsibility of the person or entity contemplating export to comply with all applicable export laws and regulations, including obtaining any required license from the U.S. government.

The U.S. government prohibits export of encryption source code to certain countries and individuals, including, but not limited to, the countries of Cuba, Iran, North Korea, Sudan, Syria, and residents and nationals of those countries.

Documentation components of this software distribution are licensed

under a Creative Commons Attribution-ShareAlike 3.0 Unported License.
(https://creativecommons.org/licenses/by-sa/3.0/)

Individual source code files are copyright MIT, Cygnus Support,
Novell, OpenVision Technologies, Oracle, Red Hat, Sun Microsystems,
FundsXpress, and others.

Project Athena, Athena, Athena MUSE, Discuss, Hesiod, Kerberos, Moira,
and Zephyr are trademarks of the Massachusetts Institute of Technology
(MIT).  No commercial use of these trademarks may be made without
prior written permission of MIT.

"Commercial use" means use of a name in a product or other for-profit
manner.  It does NOT prevent a commercial firm from referring to the
MIT trademarks in order to convey information (although in doing so,
recognition of their trademark status should be given).

========================================================================

The following copyright and permission notice applies to the
OpenVision Kerberos Administration system located in "kadmin/create",
"kadmin/dbutil", "kadmin/passwd", "kadmin/server", "lib/kadm5", and
portions of "lib/rpc":

   Copyright, OpenVision Technologies, Inc., 1993-1996, All Rights
   Reserved

   WARNING:  Retrieving the OpenVision Kerberos Administration system
   source code, as described below, indicates your acceptance of the
   following terms.  If you do not agree to the following terms, do
   not retrieve the OpenVision Kerberos administration system.

   You may freely use and distribute the Source Code and Object Code
   compiled from it, with or without modification, but this Source
   Code is provided to you "AS IS" EXCLUSIVE OF ANY WARRANTY,
   INCLUDING, WITHOUT LIMITATION, ANY WARRANTIES OF MERCHANTABILITY OR
   FITNESS FOR A PARTICULAR PURPOSE, OR ANY OTHER WARRANTY, WHETHER
   EXPRESS OR IMPLIED. IN NO EVENT WILL OPENVISION HAVE ANY LIABILITY
   FOR ANY LOST PROFITS, LOSS OF DATA OR COSTS OF PROCUREMENT OF
   SUBSTITUTE GOODS OR SERVICES, OR FOR ANY SPECIAL, INDIRECT, OR
   CONSEQUENTIAL DAMAGES ARISING OUT OF THIS AGREEMENT, INCLUDING,
   WITHOUT LIMITATION, THOSE RESULTING FROM THE USE OF THE SOURCE
   CODE, OR THE FAILURE OF THE SOURCE CODE TO PERFORM, OR FOR ANY

OTHER REASON.

OpenVision retains all copyrights in the donated Source Code. OpenVision also retains copyright to derivative works of the Source Code, whether created by OpenVision or by a third party. The OpenVision copyright notice must be preserved if derivative works are made based on the donated Source Code.

OpenVision Technologies, Inc. has donated this Kerberos Administration system to MIT for inclusion in the standard Kerberos 5 distribution. This donation underscores our commitment to continuing Kerberos technology development and our gratitude for the valuable work which has been performed by MIT and the Kerberos community.

GNU LESSER GENERAL PUBLIC LICENSE
Version 2.1, February 1999

Copyright (C) 1991, 1999 Free Software Foundation, Inc.
51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA
Everyone is permitted to copy and distribute verbatim copies
of this license document, but changing it is not allowed.

[This is the first released version of the Lesser GPL. It also counts as the successor of the GNU Library Public License, version 2, hence the version number 2.1.]

## Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public Licenses are intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users.

This license, the Lesser General Public License, applies to some specially designated software packages--typically libraries--of the Free Software Foundation and other authors who decide to use it. You can use it too, but we suggest you first think carefully about whether this license or the ordinary General Public License is the better strategy to use in any particular case, based on the explanations below.

When we speak of free software, we are referring to freedom of use, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish); that you receive source code or can get it if you want it; that you can change the software and use pieces of it in new free programs; and that you are informed that you can do these things.

To protect your rights, we need to make restrictions that forbid distributors to deny you these rights or to ask you to surrender these rights. These restrictions translate to certain responsibilities for you if you distribute copies of the library or if you modify it.

For example, if you distribute copies of the library, whether gratis or for a fee, you must give the recipients all the rights that we gave

you.  You must make sure that they, too, receive or can get the source code.  If you link other code with the library, you must provide complete object files to the recipients, so that they can relink them with the library after making changes to the library and recompiling it.  And you must show them these terms so they know their rights.

  We protect your rights with a two-step method: (1) we copyright the library, and (2) we offer you this license, which gives you legal permission to copy, distribute and/or modify the library.

  To protect each distributor, we want to make it very clear that there is no warranty for the free library.  Also, if the library is modified by someone else and passed on, the recipients should know that what they have is not the original version, so that the original author's reputation will not be affected by problems that might be introduced by others.

  Finally, software patents pose a constant threat to the existence of any free program.  We wish to make sure that a company cannot effectively restrict the users of a free program by obtaining a restrictive license from a patent holder.  Therefore, we insist that any patent license obtained for a version of the library must be consistent with the full freedom of use specified in this license.

  Most GNU software, including some libraries, is covered by the ordinary GNU General Public License.  This license, the GNU Lesser General Public License, applies to certain designated libraries, and is quite different from the ordinary General Public License.  We use this license for certain libraries in order to permit linking those libraries into non-free programs.

  When a program is linked with a library, whether statically or using a shared library, the combination of the two is legally speaking a combined work, a derivative of the original library.  The ordinary General Public License therefore permits such linking only if the entire combination fits its criteria of freedom.  The Lesser General Public License permits more lax criteria for linking other code with the library.

  We call this license the "Lesser" General Public License because it does Less to protect the user's freedom than the ordinary General Public License.  It also provides other free software developers Less of an advantage over competing non-free programs.  These disadvantages

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

are the reason we use the ordinary General Public License for many libraries.  However, the Lesser license provides advantages in certain special circumstances.

  For example, on rare occasions, there may be a special need to encourage the widest possible use of a certain library, so that it becomes a de-facto standard.  To achieve this, non-free programs must be allowed to use the library.  A more frequent case is that a free library does the same job as widely used non-free libraries.  In this case, there is little to gain by limiting the free library to free software only, so we use the Lesser General Public License.

  In other cases, permission to use a particular library in non-free programs enables a greater number of people to use a large body of free software.  For example, permission to use the GNU C Library in non-free programs enables many more people to use the whole GNU operating system, as well as its variant, the GNU/Linux operating system.

  Although the Lesser General Public License is Less protective of the users' freedom, it does ensure that the user of a program that is linked with the Library has the freedom and the wherewithal to run that program using a modified version of the Library.

  The precise terms and conditions for copying, distribution and modification follow.  Pay close attention to the difference between a "work based on the library" and a "work that uses the library".  The former contains code derived from the library, whereas the latter must be combined with the library in order to run.

GNU LESSER GENERAL PUBLIC LICENSE
TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

  0. This License Agreement applies to any software library or other program which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Lesser General Public License (also called "this License"). Each licensee is addressed as "you".

  A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification".)

"Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

a) The modified work must itself be a software library.

b) You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.

c) You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.

d) If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

(For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so

that they refer to the ordinary GNU General Public License, version 2, instead of to this License.  (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.)  Do not make any other change in these notices.

  Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

  This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

  4. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

  If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

  5. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library".  Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

  However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library".  The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

  When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library.  The

threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

6. As an exception to the Sections above, you may also combine or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer's own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

a) Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

b) Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (1) uses at run time a

copy of the library already present on the user's computer system, rather than copying library functions into the executable, and (2) will operate properly with a modified version of the library, if the user installs one, as long as the modified version is interface-compatible with the version that the work was made with.

c) Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

d) If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

e) Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the materials to be distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

7. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

a) Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the

Sections above.

b) Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

8. You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

9. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

10. Each time you redistribute the Library (or any work based on the Library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties with this License.

11. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices.  Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

  12. If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded.  In such case, this License incorporates the limitation as if written in the body of this License.

  13. The Free Software Foundation may publish revised and/or new versions of the Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number.  If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation.  If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

  14. If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission.  For software which is

copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

15. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Libraries

If you develop a new library, and you want it to be of the greatest possible use to the public, we recommend making it free software that everyone can redistribute and change. You can do so by permitting redistribution under these terms (or, alternatively, under the terms of the ordinary General Public License).

To apply these terms, attach the following notices to the library. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

```
    <one line to give the library's name and a brief idea of what it does.>
    Copyright (C) <year>  <name of author>

    This library is free software; you can redistribute it and/or
    modify it under the terms of the GNU Lesser General Public
    License as published by the Free Software Foundation; either
    version 2.1 of the License, or (at your option) any later version.

    This library is distributed in the hope that it will be useful,
    but WITHOUT ANY WARRANTY; without even the implied warranty of
    MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE.  See the GNU
    Lesser General Public License for more details.

    You should have received a copy of the GNU Lesser General Public
    License along with this library; if not, write to the Free Software
    Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA  02110-1301  US

Also add information on how to contact you by electronic and paper mail.

You should also get your employer (if you work as a programmer) or your
school, if any, to sign a "copyright disclaimer" for the library, if
necessary.  Here is a sample; alter the names:

  Yoyodyne, Inc., hereby disclaims all copyright interest in the
  library `Frob' (a library for tweaking knobs) written by James Random Hacker.

  <signature of Ty Coon>, 1 April 1990
  Ty Coon, President of Vice

That's all there is to it!
```

Apache License
Version 2.0, January 2004
http://www.apache.org/licenses/

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object

© 2026 Ocient, Inc

form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work

or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

   (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

   (b) You must cause any modified files to carry prominent notices stating that You changed the files; and

   (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

   (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

   You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use,

reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only

on Your own behalf and on Your sole responsibility, not on behalf
of any other Contributor, and only if You agree to indemnify,
defend, and hold each Contributor harmless for any liability
incurred by, or claims asserted against, such Contributor by reason
of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following
boilerplate notice, with the fields enclosed by brackets "[]"
replaced with your own identifying information. (Don't include
the brackets!)  The text should be enclosed in the appropriate
comment syntax for the file format. We also recommend that a
file or class name and description of purpose be included on the
same "printed page" as the copyright notice for easier
identification within third-party archives.

Copyright [yyyy] [name of copyright owner]

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction,
and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by
the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all
other entities that control, are controlled by, or are under common
control with that entity. For the purposes of this definition,
"control" means (i) the power, direct or indirect, to cause the
direction or management of such entity, whether by contract or
otherwise, or (ii) ownership of fifty percent (50%) or more of the
outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity
exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications,

including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of,

publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

   (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

   (b) You must cause any modified files to carry prominent notices stating that You changed the files; and

   (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

   (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or

documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly

negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets "[]" replaced with your own identifying information. (Don't include the brackets!) The text should be enclosed in the appropriate comment syntax for the file format. We also recommend that a file or class name and description of purpose be included on the same "printed page" as the copyright notice for easier identification within third-party archives.

==============================================================================
The LLVM Project is under the Apache License v2.0 with LLVM Exceptions:
==============================================================================

                                 Apache License
                           Version 2.0, January 2004
                        http://www.apache.org/licenses/

    TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

    1. Definitions.

      "License" shall mean the terms and conditions for use, reproduction,
      and distribution as defined by Sections 1 through 9 of this document.

      "Licensor" shall mean the copyright owner or entity authorized by
      the copyright owner that is granting the License.

      "Legal Entity" shall mean the union of the acting entity and all
      other entities that control, are controlled by, or are under common
      control with that entity. For the purposes of this definition,
      "control" means (i) the power, direct or indirect, to cause the
      direction or management of such entity, whether by contract or
      otherwise, or (ii) ownership of fifty percent (50%) or more of the
      outstanding shares, or (iii) beneficial ownership of such entity.

      "You" (or "Your") shall mean an individual or Legal Entity
      exercising permissions granted by this License.

      "Source" form shall mean the preferred form for making modifications,
      including but not limited to software source code, documentation
      source, and configuration files.

      "Object" form shall mean any form resulting from mechanical
      transformation or translation of a Source form, including but
      not limited to compiled object code, generated documentation,
      and conversions to other media types.

      "Work" shall mean the work of authorship, whether in Source or
      Object form, made available under the License, as indicated by a
      copyright notice that is included in or attached to the work
```

(an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s)

with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

   (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

   (b) You must cause any modified files to carry prominent notices stating that You changed the files; and

   (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

   (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

   You may add Your own copyright statement to Your modifications and

may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer,

and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets "[]" replaced with your own identifying information. (Don't include the brackets!) The text should be enclosed in the appropriate comment syntax for the file format. Creative Commons Legal Code

CC0 1.0 Universal

    CREATIVE COMMONS CORPORATION IS NOT A LAW FIRM AND DOES NOT PROVIDE
    LEGAL SERVICES. DISTRIBUTION OF THIS DOCUMENT DOES NOT CREATE AN
    ATTORNEY-CLIENT RELATIONSHIP. CREATIVE COMMONS PROVIDES THIS
    INFORMATION ON AN "AS-IS" BASIS. CREATIVE COMMONS MAKES NO WARRANTIES
    REGARDING THE USE OF THIS DOCUMENT OR THE INFORMATION OR WORKS
    PROVIDED HEREUNDER, AND DISCLAIMS LIABILITY FOR DAMAGES RESULTING FROM
    THE USE OF THIS DOCUMENT OR THE INFORMATION OR WORKS PROVIDED
    HEREUNDER.

Statement of Purpose

The laws of most jurisdictions throughout the world automatically confer exclusive Copyright and Related Rights (defined below) upon the creator and subsequent owner(s) (each and all, an "owner") of an original work of authorship and/or a database (each, a "Work").

Certain owners wish to permanently relinquish those rights to a Work for the purpose of contributing to a commons of creative, cultural and scientific works ("Commons") that the public can reliably and without fear of later claims of infringement build upon, modify, incorporate in other works, reuse and redistribute as freely as possible in any form whatsoever and for any purposes, including without limitation commercial purposes. These owners may contribute to the Commons to promote the ideal of a free culture and the further production of creative, cultural and scientific works, or to gain reputation or greater distribution for their Work in part through the use and efforts of others.

For these and/or other purposes and motivations, and without any expectation of additional consideration or compensation, the person associating CC0 with a Work (the "Affirmer"), to the extent that he or she is an owner of Copyright and Related Rights in the Work, voluntarily elects to apply CC0 to the Work and publicly distribute the Work under its

terms, with knowledge of his or her Copyright and Related Rights in the Work and the meaning and intended legal effect of CC0 on those rights.

1. Copyright and Related Rights. A Work made available under CC0 may be protected by copyright and related or neighboring rights ("Copyright and Related Rights"). Copyright and Related Rights include, but are not limited to, the following:

  i. the right to reproduce, adapt, distribute, perform, display, communicate, and translate a Work;
 ii. moral rights retained by the original author(s) and/or performer(s);
iii. publicity and privacy rights pertaining to a person's image or likeness depicted in a Work;
 iv. rights protecting against unfair competition in regards to a Work, subject to the limitations in paragraph 4(a), below;
  v. rights protecting the extraction, dissemination, use and reuse of data in a Work;
 vi. database rights (such as those arising under Directive 96/9/EC of the European Parliament and of the Council of 11 March 1996 on the legal protection of databases, and under any national implementation thereof, including any amended or successor version of such directive); and
vii. other similar, equivalent or corresponding rights throughout the world based on applicable law or treaty, and any national implementations thereof.

2. Waiver. To the greatest extent permitted by, but not in contravention of, applicable law, Affirmer hereby overtly, fully, permanently, irrevocably and unconditionally waives, abandons, and surrenders all of Affirmer's Copyright and Related Rights and associated claims and causes of action, whether now known or unknown (including existing as well as future claims and causes of action), in the Work (i) in all territories worldwide, (ii) for the maximum duration provided by applicable law or treaty (including future time extensions), (iii) in any current or future medium and for any number of copies, and (iv) for any purpose whatsoever, including without limitation commercial, advertising or promotional purposes (the "Waiver"). Affirmer makes the Waiver for the benefit of each member of the public at large and to the detriment of Affirmer's heirs and successors, fully intending that such Waiver shall not be subject to revocation, rescission, cancellation, termination, or any other legal or equitable action to disrupt the quiet enjoyment of the Work by the public as contemplated by Affirmer's express Statement of Purpose.

© 2026 Ocient, Inc
Ocient Proprietary and Confidential

3. Public License Fallback. Should any part of the Waiver for any reason be judged legally invalid or ineffective under applicable law, then the Waiver shall be preserved to the maximum extent permitted taking into account Affirmer's express Statement of Purpose. In addition, to the extent the Waiver is so judged Affirmer hereby grants to each affected person a royalty-free, non transferable, non sublicensable, non exclusive, irrevocable and unconditional license to exercise Affirmer's Copyright and Related Rights in the Work (i) in all territories worldwide, (ii) for the maximum duration provided by applicable law or treaty (including future time extensions), (iii) in any current or future medium and for any number of copies, and (iv) for any purpose whatsoever, including without limitation commercial, advertising or promotional purposes (the "License"). The License shall be deemed effective as of the date CCO was applied by Affirmer to the Work. Should any part of the License for any reason be judged legally invalid or ineffective under applicable law, such partial invalidity or ineffectiveness shall not invalidate the remainder of the License, and in such case Affirmer hereby affirms that he or she will not (i) exercise any of his or her remaining Copyright and Related Rights in the Work or (ii) assert any associated claims and causes of action with respect to the Work, in either case contrary to Affirmer's express Statement of Purpose.

4. Limitations and Disclaimers.

a. No trademark or patent rights held by Affirmer are waived, abandoned, surrendered, licensed or otherwise affected by this document.
b. Affirmer offers the Work as-is and makes no representations or warranties of any kind concerning the Work, express, implied, statutory or otherwise, including without limitation warranties of title, merchantability, fitness for a particular purpose, non infringement, or the absence of latent or other defects, accuracy, or the present or absence of errors, whether or not discoverable, all to the greatest extent permissible under applicable law.
c. Affirmer disclaims responsibility for clearing rights of other persons that may apply to the Work or any use thereof, including without limitation any person's Copyright and Related Rights in the Work. Further, Affirmer disclaims responsibility for obtaining any necessary consents, permissions or other rights required for any use of the Work.
d. Affirmer understands and acknowledges that Creative Commons is not a party to this document and has no duty or obligation with respect to this CCO or use of the Work.

Apache License
Version 2.0, January 2004
http://www.apache.org/licenses/

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the

editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct

or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

   (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

   (b) You must cause any modified files to carry prominent notices stating that You changed the files; and

   (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

   (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

   You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with

the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf

```
   of any other Contributor, and only if You agree to indemnify,
   defend, and hold each Contributor harmless for any liability
   incurred by, or claims asserted against, such Contributor by reason
   of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

   To apply the Apache License to your work, attach the following
   boilerplate notice, with the fields enclosed by brackets "[]"
   replaced with your own identifying information. (Don't include
   the brackets!)  The text should be enclosed in the appropriate
   comment syntax for the file format. We also recommend that a
   file or class name and description of purpose be included on the
   same "printed page" as the copyright notice for easier
   identification within third-party archives.

Apache License
Version 2.0, January 2004
https://www.apache.org/licenses/

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object

© 2026 Ocient, Inc

form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work

or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

   (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

   (b) You must cause any modified files to carry prominent notices stating that You changed the files; and

   (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

   (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

   You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use,

reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only

```
   on Your own behalf and on Your sole responsibility, not on behalf
   of any other Contributor, and only if You agree to indemnify,
   defend, and hold each Contributor harmless for any liability
   incurred by, or claims asserted against, such Contributor by reason
   of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS
```

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object

form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work

or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

   (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

   (b) You must cause any modified files to carry prominent notices stating that You changed the files; and

   (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

   (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

   You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use,

reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only

on Your own behalf and on Your sole responsibility, not on behalf
of any other Contributor, and only if You agree to indemnify,
defend, and hold each Contributor harmless for any liability contains
incurred by, or claims asserted against, such Contributor by reason
of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following
boilerplate notice, with the fields enclosed by brackets "[]"
replaced with your own identifying information. (Don't include
the brackets!)  The text should be enclosed in the appropriate
comment syntax for the file format. We also recommend that a
file or class name and description of purpose be included on the
same "printed page" as the copyright notice for easier
identification within third-party archives.

For zlib:

  (C) 1995-2017 Jean-loup Gailly and Mark Adler

  This software is provided 'as-is', without any express or implied
  warranty.  In no event will the authors be held liable for any damages
  arising from the use of this software.

  Permission is granted to anyone to use this software for any purpose,
  including commercial applications, and to alter it and redistribute it
  freely, subject to the following restrictions:

  1. The origin of this software must not be misrepresented; you must not
     claim that you wrote the original software. If you use this software
     in a product, an acknowledgment in the product documentation would be
     appreciated but is not required.
  2. Altered source versions must be plainly marked as such, and must not be
     misrepresented as being the original software.
  3. This notice may not be removed or altered from any source distribution.

  Jean-loup Gailly        Mark Adler
  jloup@gzip.org          madler@alumni.caltech.edu

  If you use the zlib library in a product, we would appreciate *not* receiving
  lengthy legal documents to sign.  The sources are provided for free but without
  warranty of any kind.  The library has been entirely written by Jean-loup
  Gailly and Mark Adler; it does not include third-party code.

  If you redistribute modified sources, we would appreciate that you include in
  the file ChangeLog history information documenting your changes.  Please read
  the FAQ for more information on the distribution of modified source versions.

Text

Apache License
Version 2.0, January 2004
http://www.apache.org/licenses/

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object

form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work

or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

   (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

   (b) You must cause any modified files to carry prominent notices stating that You changed the files; and

   (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

   (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

   You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use,

reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only

on Your own behalf and on Your sole responsibility, not on behalf
of any other Contributor, and only if You agree to indemnify,
defend, and hold each Contributor harmless for any liability contains
incurred by, or claims asserted against, such Contributor by reason
of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following
boilerplate notice, with the fields enclosed by brackets "[]"
replaced with your own identifying information. (Don't include
the brackets!)  The text should be enclosed in the appropriate
comment syntax for the file format. We also recommend that a
file or class name and description of purpose be included on the
same "printed page" as the copyright notice for easier
identification within third-party archives.

## pcre2

Text

```
PCRE2 Licence
=============

| SPDX-License-Identifier: | BSD-3-Clause WITH PCRE2-exception |
|---------|-------|

PCRE2 is a library of functions to support regular expressions whose syntax
and semantics are as close as possible to those of the Perl 5 language.

Releases 10.00 and above of PCRE2 are distributed under the terms of the "BSD"
licence, as specified below, with one exemption for certain binary
redistributions. The documentation for PCRE2, supplied in the "doc" directory,
is distributed under the same terms as the software itself. The data in the
testdata directory is not copyrighted and is in the public domain.

The basic library functions are written in C and are freestanding. Also
included in the distribution is a just-in-time compiler that can be used to
optimize pattern matching. This is an optional feature that can be omitted when
the library is built. The just-in-time compiler is separately licensed under the
"2-clause BSD" licence.

COPYRIGHT

    Copyright (c) 2010-2024 Zoltan Herczeg
    All rights reserved.

### Stack-less Just-In-Time compiler

    Written by:       Zoltan Herczeg
    Email local part: hzmester
    Email domain:     freemail.hu

    Copyright (c) 2009-2024 Zoltan Herczeg
    All rights reserved.

The code in the `deps/sljit` directory has its own LICENSE file.

### All other contributions

Many other contributors have participated in the authorship of PCRE2. As PCRE2 has never required a Contributor Licensing Agreement, or other copyright assignment agreement, all contributions have copyright retained by each original contributor or their employer.

THE "BSD" LICENCE
-----------------

Redistribution and use in source and binary forms, with or without modification, are permitted provided that the following conditions are met:

* Redistributions of source code must retain the above copyright notices, this list of conditions and the following disclaimer.

* Redistributions in binary form must reproduce the above copyright notices, this list of conditions and the following disclaimer in the documentation and/or other materials provided with the distribution.

* Neither the name of the University of Cambridge nor the names of any contributors may be used to endorse or promote products derived from this software without specific prior written permission.

THIS SOFTWARE IS PROVIDED BY THE COPYRIGHT HOLDERS AND CONTRIBUTORS "AS IS"

AND ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN NO EVENT SHALL THE COPYRIGHT OWNER OR CONTRIBUTORS BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

EXEMPTION FOR BINARY LIBRARY-LIKE PACKAGES
------------------------------------------

The second condition in the BSD licence (covering binary redistributions) does not apply all the way down a chain of software. If binary package A includes PCRE2, it must respect the condition, but if package B is software that includes package A, the condition is not imposed on package B unless it uses PCRE2 independently.

## pstreams

```

## Python

Text

A. HISTORY OF THE SOFTWARE
==========

Python was created in the early 1990s by Guido van Rossum at Stichting Mathematisch Centrum (CWI, see https://www.cwi.nl) in the Netherlands as a successor of a language called ABC.  Guido remains Python's principal author, although it includes many contributions from others.

In 1995, Guido continued his work on Python at the Corporation for National Research Initiatives (CNRI, see https://www.cnri.reston.va.us) in Reston, Virginia where he released several versions of the software.

In May 2000, Guido and the Python core development team moved to BeOpen.com to form the BeOpen PythonLabs team.  In October of the same year, the PythonLabs team moved to Digital Creations, which became Zope Corporation.  In 2001, the Python Software Foundation (PSF, see https://www.python.org/psf/) was formed, a non-profit organization created specifically to own Python-related Intellectual Property. Zope Corporation was a sponsoring member of the PSF.

All Python releases are Open Source (see https://opensource.org for the Open Source Definition).  Historically, most, but not all, Python releases have also been GPL-compatible; the table below summarizes the various releases.

| Release | Derived from | Year | Owner | GPL-compatible? (1) |
|---|---|---|---|---|
| 0.9.0 thru 1.2 | | 1991-1995 | CWI | yes |
| 1.3 thru 1.5.2 | 1.2 | 1995-1999 | CNRI | yes |
| 1.6 | 1.5.2 | 2000 | CNRI | no |
| 2.0 | 1.6 | 2000 | BeOpen.com | no |
| 1.6.1 | 1.6 | 2001 | CNRI | yes (2) |
| 2.1 | 2.0+1.6.1 | 2001 | PSF | no |
| 2.0.1 | 2.0+1.6.1 | 2001 | PSF | yes |
| 2.1.1 | 2.1+2.0.1 | 2001 | PSF | yes |

Footnotes:

(1) GPL-compatible doesn't mean that we're distributing Python under
    the GPL.  All Python licenses, unlike the GPL, let you distribute
    a modified version without making your changes open source.  The
    GPL-compatible licenses make it possible to combine Python with
    other software that is released under the GPL; the others don't.

(2) According to Richard Stallman, 1.6.1 is not GPL-compatible,
    because its license has a choice of law clause.  According to
    CNRI, however, Stallman's lawyer has told CNRI's lawyer that 1.6.1
    is "not incompatible" with the GPL.

Thanks to the many outside volunteers who have worked under Guido's
direction to make these releases possible.

B. TERMS AND CONDITIONS FOR ACCESSING OR OTHERWISE USING PYTHON
===============================================================

Python software and documentation are licensed under the
Python Software Foundation License Version 2.

Starting with Python 3.8.6, examples, recipes, and other code in
the documentation are dual licensed under the PSF License Version 2
and the Zero-Clause BSD license.

Some software incorporated into Python is under different licenses.
The licenses are listed with code falling under that license.

PYTHON SOFTWARE FOUNDATION LICENSE VERSION 2
--------------------------------------------

1. This LICENSE AGREEMENT is between the Python Software Foundation
("PSF"), and the Individual or Organization ("Licensee") accessing and
otherwise using this software ("Python") in source or binary form and
its associated documentation.

2. Subject to the terms and conditions of this License Agreement, PSF hereby
grants Licensee a nonexclusive, royalty-free, world-wide license to reproduce,
analyze, test, perform and/or display publicly, prepare derivative works,
distribute, and otherwise use Python alone or in any derivative version,

provided, however, that PSF's License Agreement and PSF's notice of copyright, i.e., "Copyright (c) 2001-2024 Python Software Foundation; All Rights Reserved" are retained in Python alone or in any derivative version prepared by Licensee.

3. In the event Licensee prepares a derivative work that is based on or incorporates Python or any part thereof, and wants to make the derivative work available to others as provided herein, then Licensee hereby agrees to include in any such work a brief summary of the changes made to Python.

4. PSF is making Python available to Licensee on an "AS IS" basis.  PSF MAKES NO REPRESENTATIONS OR WARRANTIES, EXPRESS OR IMPLIED.  BY WAY OF EXAMPLE, BUT NOT LIMITATION, PSF MAKES NO AND DISCLAIMS ANY REPRESENTATION OR WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE OR THAT THE USE OF PYTHON WILL NOT INFRINGE ANY THIRD PARTY RIGHTS.

5. PSF SHALL NOT BE LIABLE TO LICENSEE OR ANY OTHER USERS OF PYTHON FOR ANY INCIDENTAL, SPECIAL, OR CONSEQUENTIAL DAMAGES OR LOSS AS A RESULT OF MODIFYING, DISTRIBUTING, OR OTHERWISE USING PYTHON, OR ANY DERIVATIVE THEREOF, EVEN IF ADVISED OF THE POSSIBILITY THEREOF.

6. This License Agreement will automatically terminate upon a material breach of its terms and conditions.

7. Nothing in this License Agreement shall be deemed to create any relationship of agency, partnership, or joint venture between PSF and Licensee.  This License Agreement does not grant permission to use PSF trademarks or trade name in a trademark sense to endorse or promote products or services of Licensee, or any third party.

8. By copying, installing or otherwise using Python, Licensee agrees to be bound by the terms and conditions of this License Agreement.

BEOPEN.COM LICENSE AGREEMENT FOR PYTHON 2.0
---

BEOPEN PYTHON OPEN SOURCE LICENSE AGREEMENT VERSION 1

1. This LICENSE AGREEMENT is between BeOpen.com ("BeOpen"), having an office at 160 Saratoga Avenue, Santa Clara, CA 95051, and the

Individual or Organization ("Licensee") accessing and otherwise using this software in source or binary form and its associated documentation ("the Software").

2. Subject to the terms and conditions of this BeOpen Python License Agreement, BeOpen hereby grants Licensee a non-exclusive, royalty-free, world-wide license to reproduce, analyze, test, perform and/or display publicly, prepare derivative works, distribute, and otherwise use the Software alone or in any derivative version, provided, however, that the BeOpen Python License is retained in the Software, alone or in any derivative version prepared by Licensee.

3. BeOpen is making the Software available to Licensee on an "AS IS" basis.  BEOPEN MAKES NO REPRESENTATIONS OR WARRANTIES, EXPRESS OR IMPLIED.  BY WAY OF EXAMPLE, BUT NOT LIMITATION, BEOPEN MAKES NO AND DISCLAIMS ANY REPRESENTATION OR WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE OR THAT THE USE OF THE SOFTWARE WILL NOT INFRINGE ANY THIRD PARTY RIGHTS.

4. BEOPEN SHALL NOT BE LIABLE TO LICENSEE OR ANY OTHER USERS OF THE SOFTWARE FOR ANY INCIDENTAL, SPECIAL, OR CONSEQUENTIAL DAMAGES OR LOSS AS A RESULT OF USING, MODIFYING OR DISTRIBUTING THE SOFTWARE, OR ANY DERIVATIVE THEREOF, EVEN IF ADVISED OF THE POSSIBILITY THEREOF.

5. This License Agreement will automatically terminate upon a material breach of its terms and conditions.

6. This License Agreement shall be governed by and interpreted in all respects by the law of the State of California, excluding conflict of law provisions.  Nothing in this License Agreement shall be deemed to create any relationship of agency, partnership, or joint venture between BeOpen and Licensee.  This License Agreement does not grant permission to use BeOpen trademarks or trade names in a trademark sense to endorse or promote products or services of Licensee, or any third party.  As an exception, the "BeOpen Python" logos available at http://www.pythonlabs.com/logos.html may be used according to the permissions granted on that web page.

7. By copying, installing or otherwise using the software, Licensee agrees to be bound by the terms and conditions of this License Agreement.

CNRI LICENSE AGREEMENT FOR PYTHON 1.6.1
---------------------------------------

1. This LICENSE AGREEMENT is between the Corporation for National Research Initiatives, having an office at 1895 Preston White Drive, Reston, VA 20191 ("CNRI"), and the Individual or Organization ("Licensee") accessing and otherwise using Python 1.6.1 software in source or binary form and its associated documentation.

2. Subject to the terms and conditions of this License Agreement, CNRI hereby grants Licensee a nonexclusive, royalty-free, world-wide license to reproduce, analyze, test, perform and/or display publicly, prepare derivative works, distribute, and otherwise use Python 1.6.1 alone or in any derivative version, provided, however, that CNRI's License Agreement and CNRI's notice of copyright, i.e., "Copyright (c) 1995-2001 Corporation for National Research Initiatives; All Rights Reserved" are retained in Python 1.6.1 alone or in any derivative version prepared by Licensee.  Alternately, in lieu of CNRI's License Agreement, Licensee may substitute the following text (omitting the quotes): "Python 1.6.1 is made available subject to the terms and conditions in CNRI's License Agreement.  This Agreement together with Python 1.6.1 may be located on the internet using the following unique, persistent identifier (known as a handle): 1895.22/1013.  This Agreement may also be obtained from a proxy server on the internet using the following URL: http://hdl.handle.net/1895.22/1013".

3. In the event Licensee prepares a derivative work that is based on or incorporates Python 1.6.1 or any part thereof, and wants to make the derivative work available to others as provided herein, then Licensee hereby agrees to include in any such work a brief summary of the changes made to Python 1.6.1.

4. CNRI is making Python 1.6.1 available to Licensee on an "AS IS" basis.  CNRI MAKES NO REPRESENTATIONS OR WARRANTIES, EXPRESS OR IMPLIED.  BY WAY OF EXAMPLE, BUT NOT LIMITATION, CNRI MAKES NO AND DISCLAIMS ANY REPRESENTATION OR WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE OR THAT THE USE OF PYTHON 1.6.1 WILL NOT INFRINGE ANY THIRD PARTY RIGHTS.

5. CNRI SHALL NOT BE LIABLE TO LICENSEE OR ANY OTHER USERS OF PYTHON 1.6.1 FOR ANY INCIDENTAL, SPECIAL, OR CONSEQUENTIAL DAMAGES OR LOSS AS A RESULT OF MODIFYING, DISTRIBUTING, OR OTHERWISE USING PYTHON 1.6.1, OR ANY DERIVATIVE THEREOF, EVEN IF ADVISED OF THE POSSIBILITY THEREOF.

6. This License Agreement will automatically terminate upon a material breach of its terms and conditions.

7. This License Agreement shall be governed by the federal intellectual property law of the United States, including without limitation the federal copyright law, and, to the extent such U.S. federal law does not apply, by the law of the Commonwealth of Virginia, excluding Virginia's conflict of law provisions. Notwithstanding the foregoing, with regard to derivative works based on Python 1.6.1 that incorporate non-separable material that was previously distributed under the GNU General Public License (GPL), the law of the Commonwealth of Virginia shall govern this License Agreement only as to issues arising under or with respect to Paragraphs 4, 5, and 7 of this License Agreement.  Nothing in this License Agreement shall be deemed to create any relationship of agency, partnership, or joint venture between CNRI and Licensee.  This License Agreement does not grant permission to use CNRI trademarks or trade name in a trademark sense to endorse or promote products or services of Licensee, or any third party.

8. By clicking on the "ACCEPT" button where indicated, or by copying, installing or otherwise using Python 1.6.1, Licensee agrees to be bound by the terms and conditions of this License Agreement.

        ACCEPT

Apache License
Version 2.0, January 2004
http://www.apache.org/licenses/

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the

editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct

or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

   (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

   (b) You must cause any modified files to carry prominent notices stating that You changed the files; and

   (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

   (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

   You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with

the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf

```
   of any other Contributor, and only if You agree to indemnify,
   defend, and hold each Contributor harmless for any liability
   incurred by, or claims asserted against, such Contributor by reason
   of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

   To apply the Apache License to your work, attach the following
   boilerplate notice, with the fields enclosed by brackets "{}"
   replaced with your own identifying information. (Don't include
   the brackets!)  The text should be enclosed in the appropriate
   comment syntax for the file format. We also recommend that a
   file or class name and description of purpose be included on the
   same "printed page" as the copyright notice for easier
   identification within third-party archives.

Copyright 2018-2025 The simdjson authors

Licensed under the Apache License, Version 2.0 (the "License");
you may not use this file except in compliance with the License.
You may obtain a copy of the License at

    http://www.apache.org/licenses/LICENSE-2.0

Unless required by applicable law or agreed to in writing, software
distributed under the License is distributed on an "AS IS" BASIS,
WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied.
See the License for the specific language governing permissions and
limitations under the License.

```

for more information.

- paper-100k.pdf is an excerpt (bytes 92160 to 194560) from the paper “Combinatorial Modeling of Chromatin Features Quantitatively Predicts DNA Replication Timing in _Drosophila_” by Federico Comoglio and Renato Paro, which is licensed under the CC-BY license. See http://www.ploscompbiol.org/static/license for more ifnormation.

- alice29.txt, asyoulik.txt, plrabn12.txt and lcet10.txt are from Project Gutenberg. The first three have expired copyrights and are in the public domain; the latter does not have expired copyright, but is still in the public domain according to the license information (http://www.gutenberg.org/ebooks/53).

## spdk

Text

```
The SPDK repo contains multiple git submodules each with its own
license info.

Submodule license info:
dpdk: see dpdk/license
intel-ipsec-mb: see intel-ipsec-mb/LICENSE
isa-l: see isa-l/LICENSE
libvfio-user: see libvfio-user/LICENSE
ocf: see ocf/LICENSE

The rest of the SPDK repository uses the Open Source BSD-3-Clause
license.  SPDK also uses SPDX Unique License Identifiers to eliminate
the need to copy the license text into each individual file.

Any new file contributions to SPDK shall adhere to the BSD-3-Clause
license and use SPDX identifiers. Exceptions are subject to usual
review and must be listed in this file.

Exceptions:

* include/linux/* header files are BSD-3-Clause but do not use SPDX
  identifier to keep them identical to the same header files in the
  Linux kernel source tree.

* include/spdk/tree.h and include/spdk/queue_extras are BSD-2-Clause,
  since there were primarily imported from FreeBSD.  tree.h uses an SPDX
  identifier but also the license text to reduce differences from the
  FreeBSD source tree.

* lib/util/base64_neon.c is BSD-2-Clause.

* lib/mlx5/mlx5_ifc.h is BSD-2-Clause .

Apache License
Version 2.0, January 2004
http://www.apache.org/licenses/

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object

© 2026 Ocient, Inc

form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work

or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

   (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

   (b) You must cause any modified files to carry prominent notices stating that You changed the files; and

   (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

   (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

   You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use,

reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only

```
on Your own behalf and on Your sole responsibility, not on behalf
of any other Contributor, and only if You agree to indemnify,
defend, and hold each Contributor harmless for any liability
incurred by, or claims asserted against, such Contributor by reason
of your accepting any such warranty or additional liability.
```

Apache License
Version 2.0, January 2004
http://www.apache.org/licenses/

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the

© 2026 Ocient, Inc

editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct

or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

   (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

   (b) You must cause any modified files to carry prominent notices stating that You changed the files; and

   (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

   (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

   You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with

the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf

```
   of any other Contributor, and only if You agree to indemnify,
   defend, and hold each Contributor harmless for any liability
   incurred by, or claims asserted against, such Contributor by reason
   of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

   To apply the Apache License to your work, attach the following
   boilerplate notice, with the fields enclosed by brackets "[]"
   replaced with your own identifying information. (Don't include
   the brackets!)  The text should be enclosed in the appropriate
   comment syntax for the file format. We also recommend that a
   file or class name and description of purpose be included on the
   same "printed page" as the copyright notice for easier
   identification within third-party archives.

Copyright [yyyy] [name of copyright owner]

Apache License
Version 2.0, January 2004
http://www.apache.org/licenses/

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object

© 2026 Ocient, Inc

form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.

3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work

or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:

   (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and

   (b) You must cause any modified files to carry prominent notices stating that You changed the files; and

   (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and

   (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

   You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use,

reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.

7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.

8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.

9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only

on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets "[]" replaced with your own identifying information.
